Preface to the first edition

Writing this book has been a challenging and often daunting task. The idea originated from the staff of Oxford University Press, who suggested that there was a need for a book on Pakistan's economy, which could be understood by graduate students, researchers, scholars, academicians, and the general public at large, even without having a sound grounding in economic theory. This has indeed been the focus of the book, targeting a wide spectrum of readers, in simple language, exploring processes, ideas, and trends. I hope that this book will provide new insight on numerous home truths and myths which abound in Pakistan, and allow the reader to question what is perceived to be conventional wisdom. The most ambitious of the many aspirations of this book is to stimulate the process of enquiry amongst readers. I do not expect all readers to agree with me, but I hope they will see and welcome the different interpretation that is presented here. This, I hope, will generate debate, which is, after all, the purpose of enquiry. Since there are no absolutes in social science, only interpretations and perspectives, let this book be a new, and one hopes fresh, perspective on the economy and society in Pakistan.

This project started when I was an Associate Professor/ Senior Research Economist at the Applied Economics Research Centre, University of Karachi, where I worked for almost fifteen years and taught a course called 'Issues in Pakistan's Economy'. All my professional life was spent at the University, and I owe a debt of gratitude to the institution, and my former colleagues and students, for shaping my way of thinking. I was forced to leave the Applied Economics Research Centre under rather sad and unfortunate circumstances. My departure was only partially voluntary, and was largely in disgust at the goings on at the University and the Centre at that time. However, the work on this book continued at home, and the end result of this endeavour, which has taken four and a half years, shows that research and scholarly pursuit are possible by 'independent' researchers not necessarily affiliated to any particular organization or institution.

Despite this 'independence', however, one cannot pursue intellectual and academic interests without interaction and exchange of ideas with other scholars and academics. A number of friends have been a constant source of pleasure and irritation, in the extended discussions that I have had with them over the years. Aly Ercelawn, Asad Sayeed, Anjum Altaf, Arif Hasan, Jaffer Ahmed, Rathin Roy, Talat Aslam, and Shahzad Amjad have all spent hours and days over the last few years, arguing with me over what I thought were important issues. We remain friends despite our severe disagreements. I often refused to accept their opinions, thinking that I was the one who was always right. However, I am now more willing to accept my numerous faults, shortcomings, and mistakes and to give credit where it is due. To all these friends named above, who have inspired me at different times for different reasons, I give my heartfelt thanks for bearing with someone who has the reputation of being a difficult and stubborn person, prone to long bouts of brooding. Arif Hasan, in particular, deserves immense gratitude for taking the effort to read through the entire raw manuscript and for his generous encouragement.

I acknowledge the persistence of the Oxford University Press staff at Karachi, in making me accept and start this project. In particular, Yasmin Qureshi and Nighat Gaya were instrumental in my taking on this assignment. Zohrain Zafar, who later managed this project from OUP Karachi, is also acknowledged for directing my overly ambitious enthusiasm into concentrating on the task at hand. It is due to Zohrain that I completed this project on time. Although this has been an enormous undertaking, one which I may not have willingly accepted on my own, I now feel the wiser for having undertaken it.

After I submitted this manuscript to OUP Pakistan in August 1997, it was sent on to OUP in Oxford for the final production phase. Moreover, while the manuscript was being managed and edited at Oxford, I too was at the University of Oxford as a Visiting Scholar on the South Asian Visiting Scholars Programme. My presence in Oxford at a critical stage of the editing and management of the manuscript allowed me to interact closely and frequently with the editor of the manuscript and with the Oxford University Press staff handling the book. I must acknowledge the great help and understanding offered to me by Sally Rigg and Tony Dale of the International Education Unit at Oxford University Press in Oxford. The editor of the manuscript, Chris Bessant, has quite remarkably transformed the manuscript into a book; to Chris I acknowledge a huge debt for such a highly impressive achievement. I must also mention Aditya Nigam and Anandhi, two other scholars with me on the South Asian Visiting Scholars Programme at the University of Oxford, for making me reconsider numerous biases which I held under the guise of convictions. Had I met Aditya and Anandhi a few years earlier, this book would probably have taken on a different form.

The special contribution made by Qaisar Anjum and by Mukaram Farooqi, in typing and producing the manuscript, is beyond praise. They have produced work of exceptional quality, under unrelenting pressure from me to meet a constantly shifting deadline. To them, my wholehearted and sincere thanks.

Although it is customary to thank one's family for their inspiration and silent contribution, in my case things are a little more complicated. Both my sons Faiz and Amar still wonder why their father does not go to work: I hope when they are in a position to read this book, they will understand that one can 'go to work' sitting in the next room. Rabab, too, has often felt that I spend too much time doing academic work and not making lots of money; to her, thanks are due for being patient, supportive, and understanding, and for not complaining too much.

Preface to the second edition

The feedback from students, teachers, and researchers, on the first edition of *Issues in Pakistan's Economy*, published in 1999, is that it has done remarkably well. Very soon after it was first published, it became the standard text for students and researchers on Pakistan's economy, both in Pakistan and at universities abroad. The book is being used for courses on South Asia's development, economic history, and on its political economy at the universities of London, Cambridge, and Oxford and at universities in the US. In Pakistan, *Issues* has become the main text for students studying the country's economy at a postgraduate level in numerous colleges and universities, and has, in fact, even had specific courses designed around it. For researchers on Pakistan's economy, this book has become their main text for reference.

I have been a little surprised by how well the book has done. Part of the reason for its success has been, not because of *Issues* per se, but due to the lack of other quality publications on Pakistan's economy. It is rather sad and disappointing, that even after so many generations of social scientists—particularly economists—having made their mark as researchers and teachers, there are very few good academic books available in the market, and even fewer books that are meant for serious students. In an era when economists are now exclusively consultants, or work for the private and NGO sectors, scholars and academics no longer have the desire (or need) to publish. *Issues* has done well because there are so few books available.

This second edition is a considerably expanded, updated, and revised version of the earlier text. It contains a large amount of new material, all tables and data have been updated to the most recent available, and new chapters and themes have been added on. While the second edition of *Issues in Pakistan's Economy* is written and presented in much the manner as the first, in a political economy context and framework—with boxes, appendices, summaries of chapters, and suggested further readings—contemporary, new, and emerging issues have now also been discussed and analysed. Along with substantial revision, significantly, three new chapters have been written and added on to this second edition. Chapters on Poverty in Pakistan—one of Pakistan's most pressing problems—on the political economy of economic and trade relations between India and Pakistan, and on macroeconomic developments since 1998, are the three new additions. Along with this, there are substantial new additions on Globalization, WTO, Pakistan's new Local Government system—that of District Governments—and particularly on a re-evaluation of the Political Economy of the Pakistani State. In fact, Chapter 22 on 'Class, State, Power and Transition' (which was Chapter 19 in the first edition) has been completely reformulated.

Since 1997, I have lived a life largely of voluntary unemployment, which at times turns into self-employment whenever work comes my way. I have chosen to continue writing, doing research, lecturing at universities in Pakistan and abroad, and publishing books and journal articles working from home. I have survived financially, although at some cost, by doing the few consulting assignments that have come my way. Rather than become a full-time 'consultant', the new trend amongst economists and social scientists, I have preferred to continue with my academic and research interests. It has not been an easy existence, but I feel that I have accomplished a huge amount in terms of research, output, and publications, and have received considerable recognition for my work. Given the demise of the academe and the absence of a community of scholars in Pakistan, the feedback that one receives for such pursuits, at times, compensates for the rather lonely intellectual life of a self-motivated independent social scientist.

A number of friends and other readers deserve thanks for encouraging me to continue my research and for their responses to *Issues* when it was first published. Arif Hasan, singularly, deserves thanks for his friendship, encouragement, wisdom, and enthusiasm for what I do. Professor Mahmud Hasan Khan has been another source of inspiration and learning, and to him, my thanks too. Sadiqa Salahuddin was a great enthusiast when *Issues* was first published in 1999, and publicized the book endlessly; Amama Shabbir who taught at Hamdard University and at the IBA in Karachi also deserves thanks for using the book and for propagating it amongst students of business studies. Riaz Riazuddin of the State Bank of Pakistan, asked me to add some new ideas, which have been incorporated. My thanks also go out to Zahir Riaz, an old school friend and now an eminent lawyer, simply because he bought the book, something that suggested to me, that perhaps there is an audience out there for whom one should continue to write.

I no longer remember why I wrote *Issues in Pakistan's Economy*, except that it was Nighat Gaya then at OUP Karachi, who called me up one day in 1994, and said that a book on these lines was needed; I ended up giving four-and-a-half years of my life to writing the book. Yasmin Qureshi and Zohrain Zafar then marshalled me to its completion. Although I was told by many readers that the book required a new version—expanded, revised, updated—something that I realised very well, for many reasons, I was reluctant to start work on it again. However, OUP's Samuel Ray, in his reassuring and soothing tone, twisted my arm into doing so, something for which I am now very grateful. I believe that the one year that I have spent revising and expanding *Issues*, has made the second edition even better than the first.

S. Akbar Zaidi
Karachi, 6 January 2005

Preface to the third edition

In critical ways this, the Third Edition of *Issues in Pakistan's Economy*, is a very different book from the first two published in 1999 and 2005. Rather than merely revise and expand the Second Edition, the Third Edition undertakes a considerable rethinking and refocusing of issues which constitute Pakistan's economy. Importantly, as the new title also suggests, the focus this time around, has shifted to a *far sharper political economy perspective*. Since my training and interest is mainly in political economy rather than just mainstream economics, both the First and Second Editions were also heavily influenced by this perspective. Nevertheless, while both the earlier Editions focused more on economic history in telling Pakistan's story of economic development and structural transformation, this Third Edition builds on the earlier Editions but concentrates far more on political economy. This is particularly so, since while much of the story of Pakistan's economy has been more of the same for some decades now, with all governments following neo-liberal economic policies and regardless of supposedly differing 'ideology', all continuing to depend on the IMF and other donors to bail them out, it is clear that issues central to Pakistan's political economy—such as class, power, the state, transition—have all undergone considerable change since the publication of the Second Edition in 2005. Hence this noticeable shift and reworking of issues in Pakistan's economy, with a far greater political economy perspective.

As I wrote in the Preface to the Second Edition, I continue to be surprised by how well this book has done and that it has become the standard text for students and researchers on Pakistan's economy, both in Pakistan and at universities abroad. The book is being used for courses on South Asia's development, economic history and on its political economy, at the universities of London, Cambridge and Oxford and at numerous universities in the US. In Pakistan, *Issues* has become the main text for students studying the country's economy at a postgraduate level in numerous colleges and universities, and has, in fact, even had specific courses designed around it. For researchers on Pakistan's economy, this book has become their main text for reference.

Part of the reason for this success has been, not because of *Issues* per se, but due to the lack of other quality publications on Pakistan's economy. It is rather sad and disappointing, that even after so many generations of social scientists—particularly economists—having made their mark as researchers and teachers, there are (still) very few good academic books available in the market, and even fewer books which are meant for serious students. In an era, when economists are now exclusively consultants, or work for the private and NGO sectors, scholars and academics no longer have the desire (or need) to publish. I still maintain that *Issues* has done well only because there are so few books available.

Apart from the sharper focus on political economy and a considerable rewriting and updating of many of the earlier chapters, the Third Edition also includes many new chapters and sections within chapters, adding more than three hundred pages to the Second Edition. Six new chapters have been added, on: Local Government and Decentralization; the new Fiscal Federalism and Eighteenth Amendment; Regional and Income Inequalities; the relationship between Health and Poverty; a chapter on the economics and political economy of the War on Terror and aid to Pakistan; and, a fresh examination of Pakistan's changed Political Economy. This book builds upon all my research and publications since the Second Edition in 2005, and I have made use of many of my published articles in the Third Edition.

The structure of the book remains largely the same as the previous Editions, with boxes, appendices, summaries of chapters, and suggested further reading. The book also continues with its focus on an attempt to analyse and understand and explain *what is*, rather than suggest *what ought to be*. It offers no advice or solutions on how to fix things and concentrates more on how the economy and social and material relations of production and exchange actually work in Pakistan. The book highlights problems, issues and constraints in a political economy framework, and stays away from the lucrative though unproductive industry of offering advice. Much technocratic advice fails precisely because it is not located within a political economy context, where issues of power and control are central.

I would like to thank some individuals who have helped in completing this Third Edition. Asim Bashir Khan, in particular, deserves many thanks for his extensive support in updating the data in *Issues*, and also for contributing Chapter 13 on Fiscal Federalism. I am very grateful to Asim for all the time he gave and hope he will build upon his multiple analytical abilities and skills and join the economics profession. Aly Ercelawn, one of Pakistan's few radical economists for whom issues of social class and equality are central, contributed Section 23.4 on Income Inequalities. Ercelawn suggested to me that I ought to include a section on inequalities and immediately volunteered to contribute the Section when asked. Samuel Ray of OUP deserves thanks, as always, for seeing this project through so professionally.

Academic research is always a collaborative project and sometimes through active discourse with scholars and friends, one learns a great deal; sometimes that learning and understanding takes place through what one reads of the work of writers and scholars whom one never meets. As the text and references of *Issues* clearly reveal, I owe many debts to such scholars, most of whose work I have learnt from and continue to hold in high regard. The Bibliography and other citations in each of the chapters indicate all such influences. There are many disappointments with numerous scholars as well, many of whom wrote seminal dissertations or made some exceptional contribution some years ago, but then opted to become consultants, not having produced any

work in the public domain or worth citing since. One feels a sense of collective intellectual loss which also helps explain the reasons for the dismal state of the social sciences in Pakistan. Nevertheless, I have more hope and expectation from a growing set of younger academics who proceed for, or have just completed, their doctoral dissertations. This younger generation of social scientists, one hopes, will add their contribution to many of the debates which take place regarding social change and transformation in Pakistan, as did an older generation three decades ago.

Introduction

Pakistan's economic performance since 1947 has been, at times, quite spectacular, and at others, nothing but dismal. It failed to maintain the high growth in agriculture and manufacturing which it experienced in the 1960s, after a difficult start in the first decade following independence. The 1970s, for a host of reasons, most beyond the control of the incumbent government, were not even a patch on the 1960s, although surprisingly in the 1970s the economy performed better than it did in the 1950s. Towards the end of the 1970s, and for much of the 1980s, until at least 1988, the high-growth pattern re-emerged, although qualitatively different from the growth performance of the 1960s. The economy in the 1980s seemed to be on a higher plane than that of the 1960s. There were murmurs that perhaps Pakistan had once again returned to the 'natural' growth rate path of 6 per cent plus, and would now continue where it had left off in 1968–9. However, just as the ten-year period after 1958 had unravelled, resulting in an appreciable slowing down of the economy, so too did the end of the ten or so years from about 1978–9 onwards.

With the praetorian electoral charade starting in 1988, the growth rates of the economy once again fell to levels reminiscent of the first democratic period of 1971–7. This trend gave rise to suggestions that, since growth rates in Pakistan were highest under military regimes, and under democracy the economy had performed particularly poorly, perhaps one way of achieving high growth rates for the economy would be to maintain military regimes. The often-quoted examples of South Korea, Taiwan, Singapore, Malaysia, Thailand, and Indonesia seemed to fit the pattern, where authoritarian states had high-performing economies. This pattern was repeated again and the claims made in Pakistan, when the military-led government resulted in 7 per cent growth rates between 2002–7, and when the democratically elected government between 2008–13, could manage only 3 per cent growth.

Yet much of the analysis that examined the economic miracle of East Asia and other countries, ignored specific factors, institutional arrangements, the nature of the state, and issues of governance and administration. There are as many differences between the East Asian economies as there are similarities, and a more detailed study of each country shows peculiarities which explain why and how they developed. In fact, Pakistan's growth pattern, at least in the 1960s, also offered some general and particular pointers on how to 'do development'.

The period after 1988 brought about an extraordinary sea change in how the world thinks about economics, markets, growth, and development. In the 1960s the single focus was growth, with little concern for distribution, equality, or any other consequence of growth. Growth was supposed to trickle down from the high-income and rich savers and investors to the rest of the population. Now in the 21st century, growth is still important, but is subservient to a development which needs to be participatory, distributive, just, sustainable, and environmentally friendly. A growth rate of 7 or 8 per cent, while welcome, must be seen in the light of these other important indicators of development.

More important, the way growth is to take place now differs substantially from the way economic growth was supposed to take place prior to the mid-1980s. Markets must be efficient and must determine the demand and supply of scarce resources. States and governments must stay out of the economy, and privatization, openness, liberalization, and globalization, according to conventional wisdom, must determine choices regarding how and where to invest and what to produce. Countries should get their prices right, and reduce subsidies and all other distortions in the economy. Even in the social sectors, the role of the state is supposed to be minimized, with private sector initiative leading the way.

One of the arguments made in this book is that since 1988, when a package of neo-liberal policy reforms was introduced, the economy has performed less well than it had in the past. To a great extent, the Structural Adjustment Programme, launched in Pakistan in 1988 under the guidance and direction of the International Monetary Fund (IMF) and the World Bank, resulted in a visible slowing down in the economy, increasing income inequality, poverty, and unemployment, and hastening the process of deindustrialization. Moreover, Pakistan's wider political economy, and the failure of its elite, has made it dependent on multilateral and bilateral aid.

Ironically, although the example of South Korea in particular, and that of other East Asian economies in general, is repeatedly cited for Pakistan to emulate, the conditions and policies that were essential for the growth of the East Asian economies *were quite the opposite* of those that were propagated post-1988 under the Structural Adjustment Programme. As an illustration, we can cite just a handful of policies pursued by South Korea which are believed to be the critical cause of high growth.

South Korea's was certainly what is called an 'authoritarian industrialization pattern', where the existence of a developmentalist bureaucracy and state, and an *interventionist* bureaucracy and state, were fundamental to the process of growth that emerged. In Korea, landlordism was abolished and an extensive land reform undertaken. Cheap credit,

i.e. directed credit, was made available to the private sector at subsidized rates, with certain sectors receiving priority treatment. Prices were continuously projected as 'wrong' rather than right, with numerous government-imposed controls and restrictions pushing the industrial pattern in a preferred direction. Essentially, it was the state, a particular kind of state, that intervened in the process of economic development, *and not simply the market*, which was responsible for the extraordinary rate of growth observed in South Korea and much of East Asia. In contrast, just the opposite to interventionist and statist policies were recommended for Pakistan in the post-1988 structural adjustment period with privatization and market-based policies being advocated as the state withdrew. One can make the case now, that in Pakistan, private sector-led development will be more vulnerable to the market than state-led economic development, resulting in more variable and unsteady outcomes. There is still much merit in the role of the state as developments after the global crisis of 2008 have re-emphasized.

While a comparison of the Ayub, Zia, and Musharraf years shows that the decades of the military generals achieved high growth, it also suggests that at the end of the respective decades, the growth performance unravelled because the existing political settlement that permitted high growth came into conflict and contradiction with the very structures and systems that it had created. The result was the emergence of popular movements and opposition to the military regimes, and the foundation of a kind of democratic order. The legacies of Zia thirty years later, and of Musharraf five years after his dismissal, suggest that bad decisions can have permanent debilitating consequences.

This book, after developing a factual and interpretive story about structural transformation and economic growth and development of Pakistan since 1947, ends with the observation that a new economic and political order has emerged in the country. For want of descriptive terms, this new order is called the 'middle-class consolidation', after 1988. The reasons for it are to be found in the twenty-seven chapters of this book. We argue that, while as an economic category the middle class emerged and consolidated itself, first in the late 1960s, and then again in the 1980s, it has only now begun to consolidate itself as a political entity and force. Having said this, it is important to emphasize that nowhere do we glorify this class, if indeed it is *one* social class, for this is no pristine, revolutionary, and progressive class. This is Pakistan, and Pakistan's corrupted, rent-seeking, inefficient, and pampered middle class which is socially conservative and fragmented, contradictory in nature and in its working, includes both highly traditional religious and conservative sections within this social category, as well as indigenous and modern groups. It does not see the essential prerequisites of human capital formation and infrastructure development, for progress, for itself, or for the nation in the years to come. Pakistan's middle class, like all other classes present, has evolved in the particular and specific conditions that define what Pakistan is. To expect otherwise, that we would necessarily have a modern, progressive, educated, forward-looking middle class, as did Europe some centuries ago, or Latin America some decades ago, is wishful thinking.

The explanations of how state and society have evolved in Pakistan also emphasize the fractured nature of both, with infomalization perhaps being a key category of analysis.

About the Book

There is no denying the fact that this book has an ambitious agenda. We question some of the most repeated, incorrect statements perpetuated by students of Pakistan's economy and society. While this is perhaps a key purpose of this book, we also provide new facts about, and interpretation of, areas of the economy and time periods that have not been evaluated by researchers or academicians. Hence, the purpose is two-fold: (1) to re-examine much of the perceived conventional wisdom about developments in Pakistan's society and economy, myths which have now assumed the scale of folklore; and (2) to provide facts, data, and information about the economy, particular sectors and recent years, which are not to be found in other books on the topic. Here an attempt is made to look at historical events and developments of the past, as well as more contemporary issues. This book is meant to explain Pakistan's structural transformation over six decades in a political economy framework and explore how that change has taken place.

In the first chapter, we try to assess whether Pakistan's six decades of development and growth along with its significant structural transformation, has been a success or failure. However, this is an impossible task, and in many ways, the issue itself is redundant. The parameters of success or failure, the comparisons over space and time, the possibilities of what might have been, etc. are so imponderable and complex that it is best to leave such debate inconclusive. Pakistan has performed far better than, say, Afghanistan; however, it has fared far worse than South Korea or any of the East Asian economies, which were at comparable levels of development forty or fifty years ago. And now, with most South Asian countries, especially India, Sri Lanka, and even Bangladesh, overtaking Pakistan in terms of economic and human development, perhaps one can suggest that Pakistan has been left behind and is increasingly looking like a failed state. While we look at many of Pakistan's achievements and failures since 1947, we leave it to readers to reach their own conclusions based on the arguments presented in this chapter and the rest of the book.

The most popular myth still prevalent in Pakistan is that Pakistan is a feudal country. In Part I of this book, which deals with agriculture, and especially in Chapters 2, 3, and 4, we show that this is certainly not the case—feudalism, as the dominant economic category, may have passed into history many decades ago. What we see now, and have seen for many years, is a capitalist agriculture in Pakistan. Another often-quoted statement by students studying Pakistan's economy—through no fault of their own, for one finds these statements in most textbooks on economics—is that Pakistan is an agricultural country. Although 45 per cent of those gainfully employed are said to work in agriculture, people are moving away from rural areas altogether, or are finding non-agricultural, non-farm, rural employment. The four chapters

in Part I examine the nature of transition in Pakistan's agriculture over many decades, with Chapter 5 examining the salient problems that afflict agriculture at present. The current crisis in agriculture also, perhaps, bears witness to our claim that Pakistan is no longer an agricultural country, or at least, is moving away from agriculture.

In Part II, on industry and trade, the four chapters look at the process of industrialization in Pakistan since 1947. Chapter 6 looks at the period 1947–77, evaluating and rejecting two important assumptions made by observers in the past. The first concerns the performance of the economy in Ayub Khan's Decade of Development. Unlike other interpretations, where the nature of growth has been criticized for being inequitable, we argue that this was an intrinsic and inherent consequence of the capitalist economic policy followed by the Ayub regime. Capitalist economic development manifests its own contradictions and there is little controversy over this form of development. This chapter also takes strong issue with the popular view that the Bhutto regime was a dismal failure on account of the policies it followed. This is found to be factually incorrect. The performance of the economy was understandably not as impressive as the phenomenal growth of the 1960s, but it was better than that of the 1950s. Moreover, it was not all the fault of Bhutto and his economic managers that the economy did not do as well as had been hoped—a multitude of extrinsic and foreign factors that were not in the control of the government affected the economy severely. It seems that political ideology and a dislike for Bhutto have perpetrated the myth of the disastrous 1970s.

Chapter 7 looks at developments in industry after 1977, with particular emphasis on the post-1988 structural adjustment neo-liberal period and its consequences for industry. Chapter 8 analyses the state of industry at present, and the main problems that afflict it, with the energy crisis of the post-2008 period being a particular cause. Chapter 9 examines the development and changing nature of foreign trade in Pakistan, and questions yet another key assertion about Pakistan's economy: that the process of industrialization, under highly protected tariff walls, had been inefficient, and hence gave rise to an industry that was inefficient. However, a large number of studies that examine the impact of trade policy on industrialization have concluded that, while there were problems in the pattern of industrialization in Pakistan, the assertion that it had been inefficient was 'grossly exaggerated'.

In Part III, we analyse fiscal policy, and its impact on and consequences for economic development. In Chapter 10, we examine in detail the nature of the taxation structure and resource mobilization by different tiers of government in Pakistan prior to the changes brought about in 2010, and look at the reasons why expenditure tended to be larger than revenue. Chapter 11 looks at what has been, for many years, considered to be Pakistan's biggest economic problem: that of the large debt burden and the fiscal deficit, considered by many to be the single biggest cause of Pakistan's economic malaise. This latter assumption, however, is contested, and we show that blaming the fiscal deficit for all the economic ills of the country distorts the facts. Rather than being responsible for low growth, high inflation, a high current account deficit, crowding out, and low investment, we find that the fiscal deficit in Pakistan has, until the 1990s, been most benign. Moreover, the fact that government expenditure in Pakistan often crowds out private sector investment is conveniently ignored by mainstream economic evaluations of Pakistan. We find that government expenditure has had quite a positive role to play in development, if this money is spent correctly and in the right areas. What is important when considering government revenue and expenditure is to evaluate who is paying taxes and who is not, how much tax is being collected and how much evasion exists, where and how much government is spending, and the quality of that expenditure. Blanket statements like 'a budget must always be balanced' and 'government expenditure is always wasteful and inefficient' are, in fact, quite erroneous.

Part IV focuses on two key aspects of Pakistan's federalism, that of devolution and fiscal federalism following the 7th National Finance Commission Award and the 18th Amendment in 2009 and 2010. Military governments have always had a preference for devolution—local government without financial authority—and Chapter 12 provides an extensive narrative of the evolution of Pakistan's local government structure since 1959. Devolution, decentralization, and local government seem to be emerging as the new liberal panacea in development theory. We argue that, while they are well meant, such concepts need to be placed in a context of power relations and there are numerous structural constraints, if not prerequisites, which must be addressed to make any of these ideas functional, productive, and successful. Chapter 13 deals with the impact of the seven NFC Awards and what this might mean for development after the 18th Amendment when provinces have far greater autonomy and responsibility.

Part V, Chapters 14 and 15, which look at monetary policy, begin with a history of the banking sector in Pakistan, showing its close imprint on economic development and industrialization. Chapter 14 also looks at the equities market in Pakistan, and after examining the role that capital markets have played in other countries, we argue that directed credit schemes, subsidized credit, and distorted credit markets may be better policy options than fostering and sustaining an equities market that resembles more a game of loaded dice than a mechanism to allocate and ration credit. Chapter 15 on money, savings, and inflation, shows that inflation in Pakistan, and probably elsewhere, is not 'always and everywhere a monetary phenomenon'. Inflation seems to depend more on government-administered prices of key commodities and utilities, and on devaluation, than on an increase in money supply, excessive or otherwise. The reasons for high inflation and low savings in Pakistan also need to be re-examined in the light of the facts rather than on the basis of preconceived notions.

With Part VI we come to the three chapters that describe Pakistan's economic programme since 1988. This is the neo-liberal Structural Adjustment Programme, imposed upon Pakistan by the IMF and World Bank, and so willingly accepted and endorsed by Pakistan's elites. After explaining in Chapter 16 what constitutes the Structural Adjustment Programme and the consequences it has for the countries that have endorsed and implemented it, in Chapter 17

we turn to its impact on Pakistan. The history of IMF and Government of Pakistan relations shows that the two comprehensive programmes of 1988 and 1993–4 were both negotiated and enforced by unelected caretaker governments and had to be ratified by the incoming democratically elected governments—in both cases, interestingly, of Ms Benazir Bhutto. The chapter shows that, since the advent of the programme, the economy's performance has declined rather sharply, causing a significant loss in social welfare, especially for the poorer social classes. We emphasize the point, that in 1988, when the first major Structural Adjustment Programme was implemented, Pakistan *did not really need* such a programme, which is usually reserved for those countries that, according to the IMF, are in deep economic crisis and stagnation. In 1988, Pakistan was actually booming and one of the consequences of following the programme may have been to dampen the high growth performance of the 1980s. We suggest that, although restructuring of the economy is essential, it needs to be done on more friendly terms than those enforced by the IMF and World Bank. The reasons why Pakistan's governments run to the IMF to borrow on any pretext is that they, along with the ruling élite, are not willing to undertake the extensive reforms needed to restructure the economy, for those reforms will hurt the interests of this ruling élite. It is far safer to borrow, delay the inevitable, and pass on the debt burden to the unsuspecting general public. Chapter 18 looks at macroeconomic issues since the mid-1990s, particularly since the General Pervez Musharraf takeover of October 1999 and at the consequences to Pakistan's economy after 9/11. It also evaluates the dismal performance of the PPP government of 2008, acknowledging the claim that numerous deep-seated political and economic issues were beyond the ability of the PPP government to address or reform, yet also holds the government accountable for mismanaging the economy.

Chapters 19–21, which constitute Part VII of the book, try to understand Pakistan's development paradox. With impressive growth in different sectors of the economy, the performance of the social sectors has been visibly poor. The development paradox has a dual meaning here, since not only has economic development not translated into social sector development, but the fact that impressive economic development has taken place *without* an adequate social and human capital base is itself perplexing. Different subsectors in the social sector, such as health, education, housing, and population, are analysed in Chapters 19 and 20. We question the assertion that population, just like the fiscal deficit, is one of Pakistan's major problems, and we find that this is not necessarily the case. Moreover, the population rate seems to be falling now as economic austerity and hardships increase, and it is unaffordable to have large families. There is also a section on gender and women, where we argue that, while cosmetic changes and positive discrimination may address some of the issues facing women in Pakistan, the deep-rooted structures that cause gender bias must be confronted if economic, social, cultural and judicial emancipation of women is to take place. The third chapter in the part on the social sectors, Chapter 21 on institutional issues, looks at institutional factors and constraints that have inhibited social development. Often finances are not the sole problem affecting a sector, but issues of management, administration, and delivery are equally important. Issues like community participation, the role of non-government organizations (NGOs), governance, and decentralization are also evaluated in the light of past experience and current propaganda. We also question the belief that NGOs provide an efficient and productive development paradigm.

In Part VIII, Chapter 22 deals with Pakistan's most pressing issue, that of poverty. Despite high rates of growth, Pakistan continues to have a poverty rate with one-third of its population—60 million individuals—living below a meagre poverty line. With one-third of the country's population living in abject poverty, any assessment of high growth, growing financial reserves and economic 'stability', will need to be re-evaluated. Chapter 23 highlights the issue of regional and income inequality in Pakistan in both a historical and contemporary context.

The last four chapters of the book, in Part IX, look at the impact of the economy on political formations, the state and classes, on war, aid and terror, and on the political economy of neighbourly relations. We argue that much of the evidence presented in this book suggests that Pakistan's middle classes are beginning to assert themselves collectively, not just in economic terms, but also as a political class. While Pakistan has a long way to go to become a modern, dynamic, educated, and vibrant society, we may see the beginning of such developments. In the Political Economics sections of the book, we also examine issues related to South Asia more generally, and trade and economic relations—or their lack of—between India and Pakistan. We show that while there are no real and substantive *economic* arguments which ought to restrict greater cooperation between India and Pakistan, *political* and *institutional* interests override such economic concerns. Trade and economic arrangements are examined in the light of larger political factors. An attempt is also made in the end, to understand how the unravelling of Pakistan's state has occurred. Issues related to state collapse and the relationship between political classes and civil society on the one hand, and the omnipresent military, on the other, form a key part of this evaluation.

Part IX follows the narrative of the evolution of Pakistan's social, economic, and even political dispensations over many decades, highlighting key developments and events. As has happened so many times in Pakistan's history, events with unintended consequences have shaped Pakistan's developments. Yet, social and economic change has also been somewhat anticipated and predictable, giving rise to somewhat more certain outcomes. The immense growth of urbanization, that of a middle class, a hugely buoyant informal sector, and the breakdown of state authority and of state institutions, has been unfolding almost expectantly. The previous trend of the 'urbanization of everybody', seems to have morphed into an 'urbanization with informalization', with the co-movements of urbanization and informal relations of production and exchange perhaps dominating social and political interaction. What this

means for subsequent developments remains uncertain and one can merely (hesitantly) speculate about alternative scenarios.

The aim of this book is to provide, analyse, and interpret something called 'facts'. There is usually, amongst students, a desire for prescriptions and definite answers. This book does not provide them. What the book does, however, is to reinterpret accepted dogma, home truths, and myths about the economy and about society. It is important to emphasize that this is *one of many interpretations*, and readers are invited to contest the claims by challenging preconceived notions.

The emphasis in this book is on *process*. We examine facts and issues and developments over time, placing them in their specific contexts. It is not possible to understand the present without recourse to the past. Pakistan's economy and development today—the word 'development' implies transition and a process—need to be traced back in time; only then can we better understand the present and possibly attempt to look into the future. Nevertheless, the book also acknowledges that such transitions are incomplete, complex, wayward, often built on unintended consequences, and hence one avoids the popular Pakistani pastime of offering advice and making predictions. If one has learnt one thing from Pakistan's recent political history, it is that there is too much that we do not know and there are too many 'unknown unknowns', to hold forth on probabilities. The purpose of this book is not to offer any solutions or prescriptions, but merely help in explaining Pakistan's considerable structural and social transformation.

Data on Pakistan are notoriously poor, of dubious quality, and often fabricated to suit the needs of the government in power. Moreover, as readers will see for themselves, different official sources contradict each other. While most of the data originate from official sources, researchers do manage to get around the numbers. For example, the growth rate of the small-scale manufacturing sector has been reported by government to be a constant 8.4 per cent for more than a decade; as any observer of the Pakistani scene knows, the growth rate has at times been almost twice or even three times this rate.

One of the features of this book is that it relies on, and uses, extensive quotations from numerous published articles and books. This, we feel, will represent the arguments made by the authors themselves, rather than our understanding and interpretation of what the author is actually trying to say. Moreover, one hopes that these quotations and the use of references will whet the appetite of the reader to go to the sources and read their works in the original. Also worth mentioning is the fact that the change in nomenclature of the former North West Frontier Province (NWFP) to the current Khyber Pakhtunkhwa province, has meant that both names are used interchangeably, although an attempt is made to only use Khyber Pakhtunkhwa for references after 2010. Other organizations and institutions have also been dealt with in the same manner.

If this book can convince the reader that there are many ways of looking at what constitutes conventional wisdom, and if it stimulates the process of enquiry and questioning, it will achieve what is probably its greatest ambition.

1 Understanding Pakistan's Structural Transformation: 1947–2014

This book is about understanding Pakistan's structural transformation over six decades in a political economy framework, where the main purpose is to examine how and where such transformations have taken place, in the economy, in society, in class and gender relations, in manifestations of consumerism and culture, and other dimensions of being in the world, and to assess Pakistan's trajectory of economic and political development over this period.

How does one begin to evaluate the performance of a country over a period of more than six-and-a-half decades? Do we choose some key economic indicators of sixty-six years ago and today, and simply make comparisons, or are there other ways of looking at conditions and situations over more than six decades? Does comparing a snapshot of 1947 with one of 2014, the near impossible task as that is, reveal anything of value, other than the obvious fact that over six decades there has been extraordinary change? And, if it does, we must then ask the more important question: how has that change been brought about? What has been the *process* of development or growth or progress over the last sixty-six years? Perhaps in any evaluation, the story itself, the process and mechanism of change, the directions, developments, and dimensions of the process are the most interesting and relevant factors.

Related to the issue of *how* one looks at change and development, is the critical issue of *what* one is looking at. How can we make the claim that Pakistan today is far better off, at least economically, than it was in 1947, if indeed that is the case, something which increasingly many economists question? Does one use some set of statistics and show that because they are higher/better, so is the country and its people? A snapshot comparison of 1947 with 2014 does not certainly confirm the assertion that Pakistan is very much better off in the second decade of the twenty-first century than it was in 1947. Importantly, it matters also when one is comparing the past with a particular present. For example, many in Pakistan during the 2003–07 false boom period felt that Pakistan's economy had turned around, permanently, and that it was destined for a trajectory similar to India's or even China's, laughable though it now sounds. Moreover, does high economic growth, even if it comes about under military dictatorships—as it so often has in Pakistan—symbolize a future for a country when democracy and participatory forms of government have become the choice of people worldwide? Clearly, *how* one examines a before-and-after situation, *when* one chooses to evaluate such time-lines, *what* one privileges over numerous indicators—economic, social, political, related to justice, peace, etc.—all determine any assessment of a country's development. In many cases, one would argue that many countries are far better off over the last fifty or sixty years, countries such as Malaysia, South Korea, China, India, and even Bangladesh, all have evolved stable and prosperous economies, with most countries in the world having evolved as different forms of democracies. Can one make similar statements about Pakistan which has had a roller-coaster economy, interspersed with extensive and oppressive military dictatorships and praetorian democracy? Even after the first democratic handover between two elected governments in 2013, one is hesitant to predict certainty in Pakistan's democratic prospects at a time when the public discourse still revolves around the question of whether Pakistan is a failed state or a failing one.

The only suitable manner in which a country can be evaluated is to examine its own particular history, and to look at how certain features have evolved through certain processes and the direction in which these developments have taken place. Comparisons with other development processes in other countries are always helpful and welcome, but perhaps a better understanding of one particular country is best told by its *own development narrative*, rather than some general presumed generic laws of development or governance, as has become the global fashion these days. The *story of development* is more important than a mere comparison of the numbers at the beginning with those at the end. However, numbers do provide some insight into the process itself. For example, one can see in absolute and relative terms the *extent* of growth, development and progress that have taken place in the economy, as well as the structural transformation which has taken place—in the economy, society, class structure, in politics—perhaps the single most important outcome showing change. For example, the three-fold increase in per capita income over more than six decades may suggest that, at least according to one important indicator, the people of an area or community are better off and their standard of living in economic and material terms has trebled and that their way of living and being in the world has considerably changed. If the literacy rate has also increased three-fold over the same period, this too shows that the country and its people are better off than previously and now engage with the world differently having a significant impact on social, economic, and cultural relations amongst and between each other.

It is, perhaps, more important to assess what the key numbers and indicators could have become, i.e. the potential—fulfilled or unfulfilled—of the country. While 5 per cent of GNP growth per annum may sound impressive,

perhaps there were conditions which could have meant that the country should have achieved 8 or 9 per cent growth and, hence, 5 per cent suggests unfulfilled potential and expectations. Thus, figures need to be looked at with respect to a potential or trend rate as well. Another relative criterion which could measure success or achievement for a country is some comparison with other countries. If a number of countries were at a similar level of economic development, say, three or four decades ago, and all of them have now shown tremendous growth in absolute terms, it might be necessary to look at how relatively well these countries have progressed. The comparison between South Korea and Pakistan is a much cited case, where both were considered to be at a similar level of development and growth in the 1960s. While both have shown impressive economic growth over the last five decades, today South Korea's GNP per capita is *eighteen times* that of Pakistan. This is, indeed, an extremely telling statistic. Even more telling for Pakistan, is Bangladesh's continued prosperity, both economic and democratic: a country which was called a 'basket case' in 1973, is today being seen as a possible 'next China'. Pakistan, in comparison, has recently been compared with the likes of Somalia, Sudan, and Afghanistan.

While there are a number of important issues that one needs to be aware of when evaluating the record of economic growth over more than sixty years, the story is incomplete, if not inadequate, unless one examines the *consequences* and *results* of economic growth. Does a country with high rates of economic growth measured by per capita income over six decades, with a largely illiterate, uneducated, unhealthy population, reflect progress? And in contrast, does a poorer country with low income growth, but with higher social and human capital, with a literate, healthy, and educated population, represent progress? Or are both measures equally relevant? Pakistan's economic record has always been contrasted with its dismal performance in the social sectors, in absolute terms, and also relative to comparable countries. In contrast, countries like Cuba and Vietnam have economic statistics that seem to be less impressive than those for Pakistan, but both countries have eradicated illiteracy and have statistics in the health sector that are comparable with most developed countries. One must then ask the question: economic development *how* and *for whom*? If economic growth, development, and prosperity are manifest mainly in buying arms, spending beyond one's means on defence, and propping up a large military establishment, all at the expense of expenditure in the social sector and on the people, then no matter how dynamic the economic growth, it is surely quite meaningless. Moreover, the question of equitable distribution of resources is important, where growth in GNP per capita may not be reflected in who or how many benefit from that growth.

It is important to emphasize that the historical moment in which one discusses and evaluates issues that have evolved over time also matters. For example, in the 1950s and 1960s, economic success was dependent almost exclusively upon growth rates, regardless of their composition, distribution, or impact. A high growth rate suggested success, while those countries that had different parameters or priorities and did not come up to some acceptable growth criterion were considered poor achievers, or outright failures. In the 1970s, redistribution with growth and social sector performance became important criteria for success, and now, in the twenty-first century, 'modernization', openness, and indices of involvement and participation of the private sector have emerged alongside growth as important indicators. There have also been important shifts in political ideology and in ways of achieving the targets set. When growth was the only thing that mattered for economists, conventional wisdom held that it did not matter how one achieved high growth, for it would eventually filter down to the people. These economic pundits went so far as to suggest that strong, authoritarian states were necessary to oversee high growth rates and adequate economic performance. Perhaps many of the military dictatorships that emerged in the Third World in the 1950s, 1960s, and 1970s found justification from this argument. The foreign policy and diplomatic manoeuvring of the two superpowers, the United States and the Soviet Union, in those decades reflected this thinking when both countries propped up and supported highly dictatorial and oppressive regimes.

Today, in the neo-liberal era of the new millennium, progress and development incorporate many more qualities than they may perhaps have ever done in the past. Today, economic development must supposedly be *sustainable, participatory, environmentally responsible*, and *distributive*. The single-minded focus on growth has been replaced by a very large number of other, equally important criteria, just as the way of bringing about this growth and development has done, although conventional wisdom still grants, probably incorrectly, that growth matters most. Hence, when we evaluate an economy or country, looking back a few decades, our evaluation is tainted by the times in which we write and by the new conventional wisdom that dominates this historical juncture. No abstract, purely scientific, universal methodology can help in evaluating a long-drawn historical process, and concepts and methods used are relative, contextual, and at times very subjective.

The long preamble above has been made necessary by the need to guard against the pitfalls that afflict us when we evaluate economies or societies, whether our own or someone else's. In the case of Pakistan, it is very easy to adopt a before-and-after approach, showing what was and what is. But an evaluation cannot be even half complete until one studies the processes of economic development, of change, of transition, and of structural transformation, in order to understand where we were, where we are and where we may possibly be heading. Two points in time do not provide that way of looking at society.

This book is about the *process* of economic development in Pakistan since at least 1947, if not a little earlier. This chapter presents a largely static picture of what was and what is. The details of what happened during these sixty-six years are to be found in the chapters of this book. The numbers, the information and the analysis in this chapter, as in the rest of the book, should be studied with caution, and all the arguments listed above, about the dangers of studying and evaluating societies and economies, must be kept in mind.

While the rest of the book talks about the *process* of structural transformation and economic development, about change, about history, and about how these processes unfolded in a dynamic manner, with each specific period or era having different manifestations, this chapter, often simplistically and summarily, presents arguments that are extensively detailed in the rest of the book. The purpose of this chapter, then, is simply to highlight the *extent of change*, rather than the *manner or nature of change* in Pakistan over the last sixty-six years. The other chapters of this book address the latter issue.

1.1 Structural Transformation

Probably the most striking feature that is manifested in a view of Pakistan in 2014 as compared to 1947, is that Pakistan today is less than half of the country it was in 1947. In 1949/50, 55 per cent of Pakistan's population lived in what was then East Pakistan, making it the majority province in terms of population. Despite this majority, the eastern wing was economically discriminated against and exploited. A section of the ruling élite of the western wing of Pakistan became the oppressors and exploiters of the East Pakistani people, leading to their eventual secession after a long and bloody war of liberation ending in 1971.

The contribution made by East Pakistan to Pakistan's economy and society was huge, although never fully recognized or appreciated by West Pakistanis. This point is emphasized in the chapters of this book that look at economic development, industrialization, and trade in Pakistan during the 1950s and 1960s. No matter how significant this loss, post-1971 Pakistan seems to have moved on from the history of its first twenty-five years. However, the mid-point of Pakistan's history seems to constitute a conspicuous break with the past, after which a new country came into existence.

In 1947, Pakistan had every right to be called an 'agricultural' country. Unfortunately, most students of economics make the serious mistake of still calling Pakistan an agricultural country 66 years later, when there is no justification for doing so. At the time of independence, the major share of (West) Pakistan's gross domestic product was from agriculture, which contributed around 53 per cent, compared to 7.8 per cent from manufacturing and 11.9 per cent from retail trade. More than 65 per cent of Pakistan's labour force worked in agriculture and almost all of Pakistan's exports consisted of primary products, essentially agricultural commodities like jute and tea, which, not surprisingly, originated from East Pakistan (see Table 1.1 and Figure 1.1, and Chapters 6 and 9).

By 2013 the extent of change in Pakistan's economic structure can also be seen in Figure 1.1, and the cliché that Pakistan is basically an agricultural country is no longer true. Now, agriculture contributes a mere 21 per cent towards GDP, while manufacturing is as high as 21 per cent. The services sector has replaced agriculture as the dominant sector of the economy, contributing more than half of the total GDP. The population employed in agriculture has also fallen, although at around 45 per cent of the total labour force, agriculture is still the biggest sector in terms of the employed labour force. More importantly, the nature of exports from Pakistan has has also changed dramatically. From 99.2 per cent of total exports in 1947, primary commodities now constitute only around 15 per cent. However, one must emphasize the fact that although 85 per cent of Pakistan's exports are now manufactured goods, with textiles, garments, and yarn making up most of them, these figures are less impressive when we realize that most of Pakistan's exports still depend critically on raw cotton. Another important change related to the agricultural sector is the recent trend of the huge growth in non-farm or non-agricultural, rural, employment and income sources. The non-farm business sector and remittances may have now become the most important economic activity and input into the so called 'rural' economy.[1]

These economic changes in structure are also manifested in where people live. In 1951 when the first census in independent Pakistan was held, only 17 per cent of West Pakistanis lived in areas designated as urban; today estimates suggest that at least 60 per cent live in cities and towns, with perhaps Punjab as much as 70 per cent urbanized, depending on how we define 'urban'—see Chapters 26 and 27.[2] This shift has major repercussions for the economy, society, and the political process under way. In fact, in the context of Pakistan, perhaps the most important political factor over the last few decades has been the process and extent of urbanization and the emergence and consolidation of a middle class (see Part IX for further discussion on this issue). With more than 60 per cent of the country's population living in cities and towns, the economic profile, in terms of consumption and production patterns, has also changed quite dramatically. Urbanization's impact on social and economic development is also very significant. The extent and process of urbanization used to be considered as an indicator of progress and modernization. Although many modernizers and developmentalists no longer hold that this assumption is valid, one cannot overlook the significant structural change that has been brought about by the process of urbanization in the last 66 years, from only 6 million inhabitants out of a population of 33.8 million in 1947, to more than 110 million who now reside in cities and towns. (The implications of this change are discussed in Chapters 26 and 27.)

Just as the cliché that 'Pakistan is an agricultural country' is repeated *ad nauseam* by students of Pakistan's economy, another myth that prevails and is related to the earlier one is that 'Pakistan is a feudal country', sadly a myth perpetrated by foreign correspondents and academics on visits to Pakistan.[3] No matter how one looks at the facts and observes the manner in which society has evolved, there is no justification for believing, let alone repeating, what is perhaps Pakistan's most popular myth. By any set of criteria, there is no evidence to support this illusion. The Green Revolution of the 1960s, with its extraordinary impact on the rural areas, agriculture, the economy, and the social relations of production, put an end once and for all to the myth that Pakistan was a 'feudal' country. Chapters 2 to 5, on agriculture in Pakistan, re-emphasize this point using different criteria. Chapter 26 re-examines the issue of feudalism, asserts once again that it is no longer of any consequence, and then goes on to examine the implications of this understanding in Chapter 27. If in 1947 there were suggestions that Pakistan was a feudal

Table 1.1
Pakistan: Basic Indicators, 1947–2014

Pakistan is the world's sixth most populous nation, and has the 40th largest economy in terms of GDP, although in terms of purchasing power parity, Pakistan's economy is the 24th largest in the world. However, it is number 164 out of 203 in terms of GNP per capita, and the 146th worst performer out of 190 countries, in terms of a composite United Nations Human Development Index.

I	Population (millions)	33.78	(1951)[1]	150	(2004)	185	(2014)

country, long before the Golden Jubilee Celebrations took place in 1997, all the evidence pointed to the contrary. While feudalism in Pakistan died a very long time ago, modern-day Pakistan has also seen the demise of agriculturists as a powerful economic, social and political force. The huge change in economic, social, and hence political power, from the agriculturist, so-called feudal, lobby towards an urban and rural middle class, is probably one of the key indicators highlighting the extraordinary structural transformation of Pakistan in over six decades.

1.2 Decades and Epochs

The sixty-six years since 1947 can be distinguished by numerous epochs or eras, which represent different economic policies and planning and management arrangements. The first eleven years, between 1947 and 1958, are the years when the country and economy were trying to settle down, but to no avail. This period was followed by what many still call the golden era of economic development (or at least economic growth) in the Decade of Development under Ayub Khan. The economy and the political scene had indeed stabilized and settled down, with the result that growth rates were unprecedented, and Pakistan was considered to be one of the few countries at that time which would achieve developed country status. With the war of liberation in East Pakistan, the majority wing left Pakistan to form Bangladesh and two new countries, not one, were born.

Post-1971 Pakistan was a new country in every respect, compared to the one that had existed between 1947 and 1971. The third brief, albeit highly significant era in Pakistan's

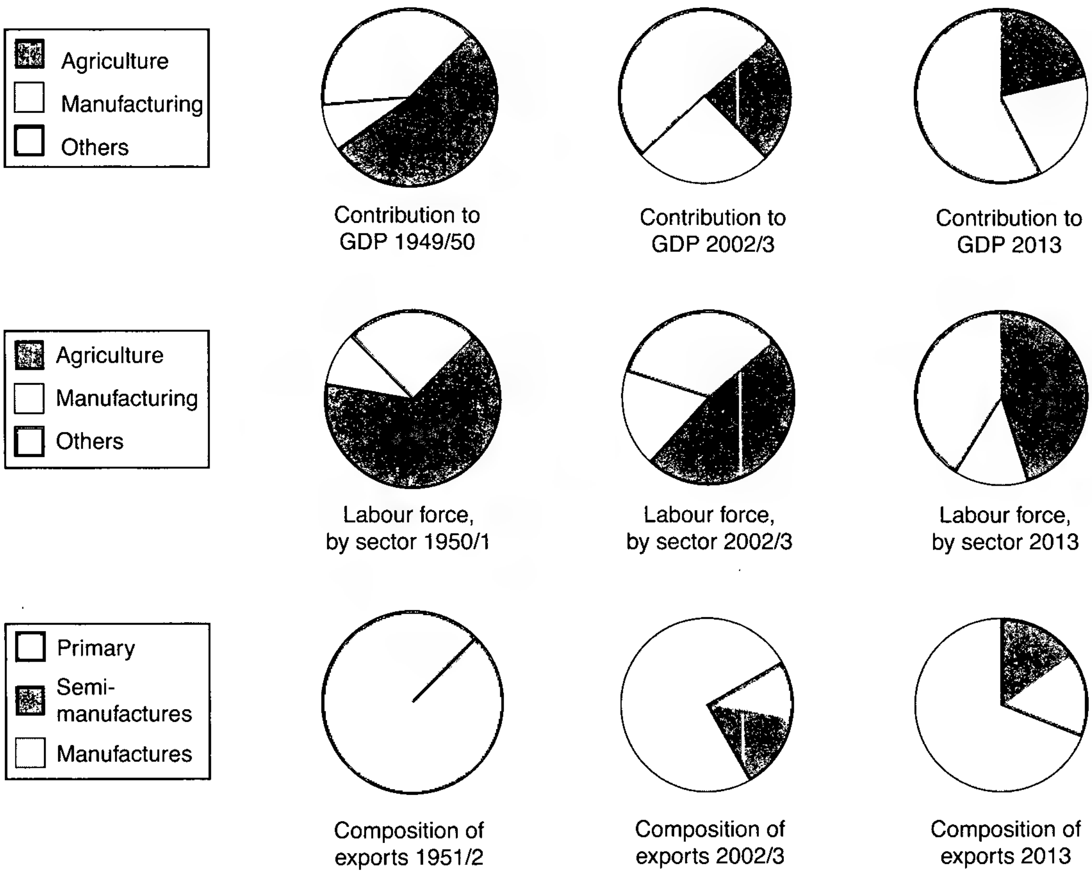

Figure 1.1: Structural Change in Pakistan: 1947–2013

history, was the five-and-a-half year period of Zulfikar Ali Bhutto. His populism or Islamic Socialism, or just plain rhetoric, made him the most popular, and at that time the only elected leader to emerge in what was left of Pakistan. His rule ended with the imposition of Pakistan's second martial law under General Zia ul-Haq in 1977, perhaps the most brutal of all three, which changed Pakistan for the worse, perhaps irreversibly, with connotations and repercussions which continue well after three-and-a-half decades. There were some similarities between the first and the second martial laws (discussed in detail in later chapters), but the world was now a very different place compared with the 1960s. The opening up of the Middle East, the first Afghan war (with its consequences of a drugs and arms culture in Pakistan), attempts at the Islamization of the economy and society, and a praetorian democracy between 1985 and 1988, were amongst the salient features of the Zia era.

The death of General Zia in many ways once again, brought about the end of the old Pakistan, and 1988 signalled the third birth of the nation after 1947 and 1971 (see Chapters 26 and 27 for far greater details about the evolution of society after 1988). While political and social changes were fast to emerge, the post-1988 economic changes and programmes also represented a departure from the past, with very significant impacts on society, many of which were highly deleterious.

Yet another military coup in 1999, which brought General Pervez Musharraf to power, in some ways, ended the complex political, civil, and military arrangement that had existed since 1988. The return of the military directly into politics after 1999 implied considerable change compared to the 1988–99 period. Moreover, after 9/11 with the world economic and political map redesigned, the world, our region, and domestic economic and political arrangements, have all been markedly affected (see Chapter 18, and Part IX for these issues). Political and economic changes in 2007 and 2008 signalled hope and optimism in many ways, but also demonstrated abject failure and mismanagement during the 2008–13 democratic transition. Elections in 2013, the first without direct military involvement, signal possible departures, although making predictions in Pakistan is an unwise, if highly popular, pastime.

This section very briefly presents the main features, achievements, and consequences of the many epochs in the sixty-six years since Pakistan's independence. As will become clear, especially with reference to the later eras, 'independence' and 'sovereignty' are words that have little meaning in a country that celebrated its Golden Jubilee of Independence some years ago.

Table 1.2: Growth Rates in Pakistan (Average Annual %)

	1960s	1970s	1980s	1990s	1999–2002	2003–2008	2008–2012	2000–2010	2013P
GDP	6.77	4.84	6.45	4.6	3.29	6.83	2.78	4.7	3.6
Agriculture	5.07	2.37	5.44	4.4	1.49	4.09	2.3	3.2	3.3
Manufacturing	9.93	5.50	8.21	4.8	4.84	9.69	0.45	7.1	3.5

1.2.1 Laying the Foundations: 1947–58

In 1947, Pakistan was, indeed, a predominantly agrarian, undeveloped, newly independent nation, with little industry, few services, and no infrastructure. In the first few years, Pakistan's main concern was one of survival, where adverse international conditions and a precarious domestic situation, with millions of refugees, made the provision of very basic necessities the primary task of the government. Attempts to restructure the economy and to ensure that it was on a strong footing could be undertaken only after the initial political and economic shocks had been dealt with.

The first decade of economic policy and planning witnessed the attempts of a bureaucracy to keep Pakistan on its feet. The herculean task of building an economic base was left to the state sector as the private sector was still in an embryonic state and did not have the capital to lead an industrial revolution in the country. It was the windfall gains made by the mercantile class during and after the Korean War in 1952 that paved the way for the foundation of industry, an industry which the state sector helped develop and then handed over to the private sector.

1.2.2 The Decade of Development: 1958–68

If one examines Pakistan's economic growth record, the 1960s stands out as the decade with the best performance. Table 1.2 gives a useful indication of the nature of the differences between the 1960s, 1970s, and 1980s. While the rates of growth for the 1960s and the 1980s seem to be quite close in most categories, there are important conceptual and ideological differences in the modes of development under the two military regimes.

Curiously, the 1960s has been termed a 'controversial' decade for the type of economic policy pursued, and the resulting economic and political effects. Dozens of economists and social scientists have written about Ayub Khan's era, and they are generally agreed that considerable economic growth and development did indeed take place. They argue that significant leaps were made in industrial and agricultural production, where growth rates in excess of 20 per cent per annum were witnessed in the large-scale manufacturing sector. In the first five years of the Ayub rule, manufacturing grew by as much as 17 per cent, and in the second half of Ayub Khan's rule, agricultural growth increased by 6 per cent, while industry grew by 10 per cent. Table 1.2 shows that the economy in general, and the different individual sectors, grew by phenomenal rates, and Pakistan was considered to be a model capitalist economy in the 1960s.

The controversy surrounds the eventual effects and results of this phenomenal growth rate. Observers have pointed out that this aggressive capitalist development caused serious economic, social, and political tensions. They argue that there was increased disparity in incomes across different regions which was manifest in the concentration of economic prosperity in both the industrial and agricultural sectors in central Punjab, and in industry in Karachi. Critics of Ayub Khan's model of development point out that these two regions were permitted to grow at the expense of the rest

of the country, and the end result was the feeling in East Pakistan of utter neglect and betrayal. Apart from the very obvious phenomenon of regional disparities, a number of scholars also took pains to show that there was a great deal of economic concentration amongst individuals, and that numerous business empires were created. This, they showed, resulted in increasing income inequality.

Of course, all this did happen. There was tremendous growth, but there was also increasing disparity across classes and regions. The social sectors were also neglected. There was little or no increase in the level of real wages, and social equity was of little concern. Functional inequality was the preferred philosophy of Mahbub ul Haq and Ayub Khan's Harvard Advisory Group, and their focus was on the rich, who were supposed to generate more savings, and thus were to be the motors of capitalist growth and development.

It is surprising that economists and social scientists were so surprised and upset at what had happened during Ayub Khan's rule. What would have been surprising was the *lack* of this 'controversial' and contradictory development. Capitalist development, especially in the manner in which it was implemented in Pakistan at the time, implied unequal development, and to have expected otherwise is naïveté. There is a need now to examine the Decade of Development afresh. The consequence of Ayub Khan's economic policies was that there was growth and development, the forces of production did expand, a proletariat was born, and compared to the earlier periods, this was indeed a very progressive era in the evolution of the economic and political process of Pakistan. The 'controversial' repercussions were inherent, inbuilt, and inevitable.

However, what is most interesting about Ayub Khan's era is the fact that the economic package was thoroughly illiberal, and was almost the opposite of what is being termed economic liberalism today. It was capitalism, and the private sector did play a significant role, but it was the guided, bureaucratically-governed and directed capitalism, perhaps a benevolent state capitalism, of a developmentalist state. The bureaucracy played an active, influential, and constructive role in the establishment of private sector capital in Pakistan. The dozens of constraints on setting up industry, red tape, and numerous hurdles in financial and industrial policy did not stop the impressive growth in this period. The nature of the economy was precisely what it should not have been according to the doctrine of economic liberalism and liberalization. Trade was highly controlled and closed. The exchange rate was overvalued, and it distorted local markets. Financial capital was rationed, and the stock market was a playground for a handful of people. The government's presence was everywhere, directing and encouraging the private sector and the market. The agricultural sector was consciously identified by the government as a vehicle for growth, and numerous (governmental) decisions were taken which resulted in growth at times in excess of 11 per cent per year. The transformation of the agricultural sector from a pre-capitalist to a capitalist stage was accelerated by active involvement and interference by the government. Even public sector projects commissioned by the Pakistan Industrial Development Corporation (PIDC) were gifted away to the private sector. The bureaucracy, in essence, gave birth to the private sector capitalist in Pakistan—indeed—a very illiberal process according to the conventional wisdom.

1.2.3 The Bad Luck Years: 1971–77

Ironically, while most intellectuals condemned Ayub Khan's policies, it was these policies which gave rise to populism and the brand of policies particular to Zulfikar Ali Bhutto, who was supported by the same intellectuals. Without Ayub, Bhutto would not have been possible. Bhutto's economic policies were more illiberal than those of his predecessor, and his nationalization was said to be the major cause for a huge downward trend in growth. However, Table 1.2 shows that in the 1970s GDP grew by close to 5 per cent, which indicates the need, as in the case of Ayub, for a thorough re-examination of the economic programme of Bhutto.

Bhutto's economic programme has been labelled a failure by his critics, and even his supporters have, under the barrage of propaganda and the changed world situation, at best been apologetic and at worst have joined the maligning chorus. In many ways he was an unlucky politician, and events beyond his control affected his economic programme. The economic loss of East Pakistan was strongly felt—West Pakistan 'exported' 50 per cent of its goods to the eastern wing and acquired a large amount of foreign exchange from its raw material exports. The devaluation of the Pakistani rupee by 120 per cent in May 1972 brought significant dividends in terms of export growth—in one year (1972/3) despite the loss of East Pakistan's exportable produce, West Pakistan doubled its foreign exchange earnings. However, the 1973 OPEC price increases played havoc with Pakistan's import bill and the balance of payments deteriorated. Also, the period after 1973 saw a serious worldwide recession affecting Pakistan's exports. Recurrent domestic cotton crop failures and floods in 1973, 1974 (along with pest attacks), and 1976 affected Pakistan's main exports. The large nationalized units taken over by Bhutto were the most inefficient in the industrial sector and, despite nationalization, industry experienced a reasonable growth rate, with the nationalized sector doing better than most believe.

Bhutto's government also laid the foundations for future growth and development from which his successor benefitted. Basic industries were set up and a base for a capital goods industry was established, which resulted in subsequent growth. The Middle East boom which Bhutto initiated, in another ironic twist, helped keep Zia in power for some years. The illiberal economic policies of Zulfikar Ali Bhutto were responsible for growth not only during his own tenure, but also in the period after 1977.

1.2.4 The Second Military Government: 1977–88

General Zia ul-Haq's regime was more liberal in economic terms—though certainly not politically—than any of his predecessors. While the civilian-military bureaucracy played a prominent role in acquiring capital and in assuming the role of entrepreneur and financier, numerous individual

capitalists emerged in the stable post-Bhutto era. High rates of industrial growth were led by the coming on stream of the earlier investment made by the public sector under Bhutto, especially in heavy industries, and also by a rapid expansion in domestic demand. While the trend to liberalize the economy was escalated consciously in the Zia period, the Soviet invasion of Afghanistan and the excessive involvement in Pakistan by the USA helped ensure that steps were taken to increase growth. Remittances from the Middle East and aid from abroad helped launch Pakistan's second economic revolution, where the middle class emerged as a formidable economic and political category. By becoming the capitalist world's 'front line' state against all things Soviet, and especially against Soviet expansionism in the region, Pakistan's government gained in terms of financial aid and resources. However, General Zia's martial rule inflicted deep-rooted damage to Pakistani society, creating intolerance and instituting violence, from which it still suffers.

1.2.5 Neo-liberalism, Structural Adjustment, and Praetorian Politics

The period after the death of General Zia in 1988 resulted in the return of not democracy, but a manipulated (by the military and its secret agencies) form of electoral politics to Pakistan. Between August 1988 and August 1997, Pakistan had four general elections, with both Benazir Bhutto and Nawaz Sharif being returned to power twice, with active involvement by anti-democratic forces determining political outcomes. While in 1988 many academics and observers felt that this may have been the beginning of a post-military, democratic transition in Pakistan, they were very wrong in their assessment about the nature of the control, power, manipulation, and intrusion of Pakistan's deep state, revelations which were formally revealed to the public as late as 2012 and 2013. None of the elected governments were able to complete their full term due to the persistent involvement of the military and its junior partner, the bureaucracy. There were also more than a few 'caretaker' governments, of which the last two in particular, headed by Moeen Qureishi (a retired World Bank Vice President) and by Meraj Khalid were very controversial. However, while the post-1988 period could, in 1988 (now incorrectly), be termed the 'Period of the Return to Democracy', it was more the manipulation of political actors, and it could better be called the 'Era of Neo-liberalism and Structural Adjustment'. We argue later in this book that, rather than the electoral process, it was this particular economic programme and process which determined the course of Pakistan from 1988 onwards. Furthermore, while the electoral political transition was arrested in October 1999 yet again, the economic policies continued even more vigorously. The process of liberalization, openness, privatization, and market friendliness continued unabated regardless of the visibly noticeable damage caused.

Since 1988, Pakistan's economy has been under the tutelage of the international lending agencies, the IMF and the World Bank. Economic policies, labelled 'economic liberalization, stabilization, and structural adjustment', evolved in Washington have been imposed upon a hundred countries worldwide, with Pakistan and its governments amongst the most enthusiastic adherents to the Washington Consensus. Moreover, Pakistan's governments have taken the art of subservience to new depths: an examination of World Bank and IMF documents since 1988 reveals that almost every decision of any consequence taken by the various governments that have been in power has been predetermined by the two Washington agencies, and that Pakistan has merely followed diktat. This is evidenced also by the fact that in the 1990s, Pakistan seldom found the need to appoint a full-time Finance Minister, as numerous advisers on loan from the World Bank and the IMF ensured that implementation was thorough. While this blind adherence to Washington has meant a loss of sovereignty for the Pakistani state and its people, the outcome of these policies has had serious consequences for the economy overall, and for individuals—see Part VI of this book for more on the Structural Adjustment Programme in Pakistan. In 2008 and 2013, both democratically elected governments, once again, enthusiastically approached the IMF for large loans, ostensibly on the basis of 'home-grown' programmes, with neo-liberalism now the official creed of all political parties in Pakistan.

1.2.6 Lifestyle Liberalism, Dictatorship, War, and Subjugation: 1999–2007

While Pakistan's economic programme has been supposedly one of a 'liberal' economic tenor, with the state receding and markets apparently presumed to be free since 1988, its politics was far from liberal in the 'lifestyle liberal' era during General Pervez Musharraf's military dictatorship embraced by Pakistan's undemocratic liberals and elite.[4] Seizing the opportunity to support a lifestyle liberal General, many members of Pakistan's civil society and political class who had struggled for democracy in Pakistan earlier, were quick to become part of the team of the individual responsible for Kargil in 1999 and who overthrew an elected Prime Minister. The choice being made in 1999 was falsely construed as one between an Islamicizing elected government, deviating even from basic electoral protocol, to an overtly socially liberal, 'moderately enlightened', military general. Democracy was inconsequential in 1999 to Musharraf's supporters, and for them something packaged as 'liberalism' mattered far more. This was 1999.

In 2001, the world changed and Pakistan was caught up in the War Against Terrorism once again. Musharraf, who had become popular at home after ousting Nawaz Sharif in 1999, was considered a pariah by the international leadership in his first two years. The economy was doing badly, as it had under General Zia in 1977 until the Soviet invasion of Afghanistan granted Zia a longevity he could not have imagined when he overthrew and murdered Zulfikar Ali Bhutto. General Pervez Musharraf was rescued by the events following 9/11 and another invasion of Afghanistan, in 2001, this time by the Americans. The economy boomed under a false cocktail of aid from the US, IMF, and other global economic support—see Chapters 18 and 25—and Musharraf, backed to the hilt by the US, particularly President George W Bush, was granted a

longevity. The US support ensured, as it had in the 1960s and 1980s, that Pakistan would continue to be ruled by a military general.

Yet, it would be puerile to blame the US for everything that has gone wrong in Pakistan, although blame is certainly warranted. Just as Pakistan's political elite has been responsible for allowing the IMF to run Pakistan's economic policy, and the IMF cannot be held responsible for Pakistan's leadership running to it every few years for its reluctance to undertake urgent reform, its political class has also, at least in the past, been responsible for supporting military authoritarianism and dictatorship. It was opposition parties who welcomed Musharraf and who continued to support his lifestyle liberal, praetorian election charade, and the US simply joined and strengthened the chorus. Pakistan's political class and its civil society were to blame equally for Musharraf's longevity—see Chapter 26. With the economy booming, and Pakistan a non-Nato ally, Pakistan's elite was happy to support Musharraf's electoral shenanigans without much active hostility. In fact, as Chapter 26 reveals, the argument was also made here that perhaps Pakistan's elite did not want a messy democracy and preferred a lifestyle liberal, military-dominated electoral process which allowed some symbolic representation. Clearly, one was wrong, and numerous events in 2007 proved how brittle the boom in the economy was, and how unstable the authoritarian order had become.

1.2.7 Another Democratic Transition? 2007 Onwards

Numerous events in 2007, once again, changed the course of Pakistan's political trajectory as the hold of the Musharraf regime weakened and he made numerous decisions which led to his downfall. The reprimand of the Chief Justice of Pakistan, a military attack on the Lal Masjid in Islamabad, and subsequently a clampdown on the very active media leading to an Emergency in the country, all in 2007, undermined any sense of stability the regime may have displayed. In particular, it was the Lawyers' Movement of 2007, that led the main challenge to the Musharraf regime, as the term of his elected parliament came to an end and elections were inevitable. Political deals cut between the military General and the likely prime ministerial candidate, Benazir Bhutto, suggested a more controlled electoral transition, with the former as President and she as his Prime Minister. However, 2007 ended with the assassination of Ms Bhutto resulting in Pakistan's freest and fairest democratic elections since 1970, with Ms Bhutto's party returned to power. Eventually, Musharraf was forced out and handed power to Pakistan's first democratically elected civilian government in four decades, although he still remained President of Pakistan.[5]

While the Lawyers' Movement was one of the many forces which resulted in democracy returning to Pakistan, other factors made an important contribution. The rise of a free media which was aggressive, often brave, and surprisingly even pro-democratic, played a key role in pushing Musharraf's military dictatorship away, as they did in later years when democracy was threatened from the inside.[6] Opposition parties, particularly those which had supported military intervention in the past, had also learnt their lessons and made commitments to furthering the cause of democracy in Pakistan rather than exploiting weaknesses to push their own agendas. Even the Supreme Judiciary, which had in years past endorsed every authoritarian and dictatorial decision by every military dictator, refashioned itself as an activist judiciary against military arbitrariness. Much had seemed to have been learnt by the political class in many years in exile and isolation, and democracy became an audible slogan championed even by right wing Islamist parties.

Yet, the 2008 democratic transition was weak, cautious, rapacious, and incomplete. The civilian government failed to mark its imprint on the political process through fear and incompetence, despite the fact that it had many opportunities to do so. The Osama bin Laden killing and Abbotabad raid, the attack on the Mehran Base in Karachi, and the military's many weaknesses which gave the civilian government ample opportunity to enforce its authority, were not exploited. Democrats did not know how to consolidate democracy, although given the opportunities to do so; however, one must admit that just staying on in power for five years for the People's Party government, given constant intrigue and threats from the 'Establishment', was itself a major achievement. While democracy may not have been substantially strengthened during the 2008–13 period, the fact that it persisted might be the main achievement of the last decade which allowed a subsequent transition to take place in 2013.

1.3 Transformation and Development: The Balance Sheet

This book is about the process of structural transformation and economic development in Pakistan over the last sixty-six years, and is devoted to understanding how, why and under what conditions that process has taken place. The summary presented in section 1.2 is an extremely brief condensation of a few of the ideas that constitute this book, and should not be seen as an alternative to the more detailed story that follows. Having presented an introduction to the main epochs in the first six decades of Pakistan's existence, in this section we try to examine the issue of whether Pakistan's six decades of economic growth, development and transformation can be called a success or a failure, or whether, as is often the case, the answer lies somewhere in between.

For most of Pakistan's sixty-six years, the economy has shown healthy growth around a trend rate of nearly 5.2 per cent per annum, although the overall trend has been falling since 1988. There have been years where the rate rose to even more than the trend rate, and other years when it fell to less than even half: it was an abysmal 1.7 per cent in 1996/7, perhaps the lowest of all time at that juncture, and fell to only 0.4 per cent in 2008/09. If an evaluation of Pakistan's economy had taken place in 1968, for the most part, based on economic growth criteria, one would have called it a resounding success. Indeed, the government of Ayub Khan called its era the 'Decade of Development'. An evaluation of Pakistan's first quarter-century, in August 1972, would have

looked at the country's history differently, Pakistan having lost its eastern wing and having suffered the consequences and contradictions of the Decade of Development, which were manifested in late 1968 just as the government of the day celebrated its pyrrhic victory. Success and failure are, clearly, highly relative terms.

Even if the growth rate of Pakistan has shown impressive trends, what has been the consequence of that growth? Does Pakistan produce most of its products, or is it now a highly import-dependent economy? Many countries of the world depend on trade and on imports. Is it of any consequence that Pakistan is a member of that group? The nature and quality of output and the conditions under which it is produced are also important. Moreover, can one grant a country any measure of success when it is chronically dependent on either bilateral or multilateral aid?

One also needs to compare Pakistan's performance with that of other countries to see if Pakistan has done as well (or as badly) as its own data show. Five per cent growth per year, even in simple terms, sounds commendable. But countries with similar initial conditions to Pakistan experienced growth rates that were higher, more consistent, and longer lasting than Pakistan's 5 per cent. Many of those countries now rank among the newly industrializing countries (NICs), while Pakistan is currently the thirty-ninth poorest nation out of 203 classified by the World Bank, using GNP per capita as the main criterion (see Chapter 19 for further discussion of this issue). In terms of human and social capital, the United Nations Development Programme (UNDP) ranked Pakistan 120 in 1991 ahead of (better than) India, 123rd and Bangladesh, 136th. In 2003, Pakistan was ranked 144, way behind India (127) and even Bangladesh (139). Within two years (2001–03), Pakistan's ranking fell from the 138th position to the 144th. Transparency International, a German research institute that analyses society and politics around the globe, in 1996/7 ranked Pakistan as the second most corrupt country in the world after Nigeria, a position which improved somewhat in 2013, but is still embarrassingly poor. Hence, by what measure does one compare or classify success?

One can list tables of numerous indicators showing their trend over the last six decades. For example, in 1947 there were 8,413 primary schools in the country, of which 1,549 were for girls. By 2012 the number of primary schools had increased to 157,200, a rise of almost twenty-fold. Girls' schools had increased by a factor of forty-five in this period. On paper these statistics indicate major achievements, but has the quality of education improved at all? Can one say that the twenty-fold increase in education facilities reflects at least a three or four-fold improvement in the quality of education? The answer is probably in the negative. Indeed, many people would feel that, despite the increase in quantity, the *quality* of public sector education has made a noticeable downward shift. However, the increase in the number of educational facilities has allowed a larger number of people to have access to whatever education is available. Quite possibly, children of poorer families and those in the lower income groups may have had their first opportunity ever to send their children to school. This change in the social and economic profile of schoolchildren must count as some measure of success. However, the fact that the quality ought to have been far better and that the results of education, literacy, scientific skills, etc. far more extensively spread amongst the population, suggests that it may be only a small measure of success. While it is usual practice to show how numbers have increased over the years, one must look at such trends and 'evidence' with great caution.

Another measure of success is the extent of autonomy, sovereignty, or independence that a country acquires. After sixty-six years, such criteria should be of less importance than when a country has been newly created and is trying to find its feet. Section 1.2 shows, however, that after 1988 any semblance of sovereignty and independence that Pakistan may once have had has been lost—although, it really hasn't had much earlier either. Today, Pakistan is a highly aid-dependent economy with multilateral institutions and foreign governments playing a dominant role in both the political and economic affairs of the state, even after six decades of political independence. While other countries have also made use of aid and loans, they have used that money for development purposes, unlike Pakistan, where much of the assistance has been squandered, often in dubious circumstances and through illegal and illicit channels. Moreover, events following 9/11 have revealed further weaknesses in Pakistan's political structure with regard to foreign domination.

Six decades are a fairly long time for countries to change and transform their economic and social systems. Given even a semblance of sensibility in a nation, with an elite that has the desire to improve even only itself, in sixty-six years much can be expected to change. Pakistan has had much more than just a bare minimum of endowments and resources, and has achieved far more than a bare level of subsistence. Living standards have improved manifold over the last six decades, and more so during the latter half of this period. Numerous factors have been responsible for this growth, some fortuitous, most consciously sought after. In some ways the growth/development/progress that has taken place has been unremarkable, because it was almost inevitable, given initial conditions. Even without all the effort that was made to influence and direct policy, growth and development would have taken place. The only contentious issue is the degree, extent, and form of that growth and development, and the extent to which it fulfilled prospects and potential.

There are also economic and social costs and consequences of development and growth. Since growth has been the overriding aim of governments in the past, and as it is probably the statistic that most impresses politicians, planners, and economists, any negative ramifications of this single-mindedness have been ignored. Environmental degradation is now considered to be the most serious repercussion of this strategy, with pollution and the decay of natural resources quite rampant. Urbanization, which has a great many advantages, also brings with it greater demands on basic facilities and infrastructure, which cannot be provided to all. The result is squalor and poor and unhygienic living conditions for the large majority of people who live in cities, not always out of choice. For urban residents in Pakistan, rich and poor alike, the deteriorating law and

order situation, offering no protection for life or property with the state having virtually collapsed, is possibly the most important and immediate negative consequence of inequitable growth. Many Pakistanis would question the claim made by statisticians and others, on the basis of high growth figures, that Pakistan has made huge progress; for these people, lower growth with more personal security and freedom is probably a preferred alternative.

Pakistan's economic development has been a capitalist development, where the private sector has played a key role. In the early days, the state played the critical role in establishing industry and assisted the private sector, but in more recent years as the role of the state has diminished, private sector-led growth has been the norm. However, Pakistan's capitalist path of development has been unusual for reasons which are discussed at different times in this book, and especially in Chapters 26 and 27. Pakistan's has been a very crude, peculiar capitalism, much influenced by the country's history and culture and the formation of social, economic, and political classes. The excessive amount of corruption, rent-seeking, and clientelism in Pakistani society is both responsible for and a product of the specific nature of Pakistan's development. On many other counts too, Pakistan has been an abject failure. The inability to evolve a state which can protect its people, or a political and civil society class which believes in the strengthening of democratic norms and practices, or a society in which different views, especially religious views, are given tolerance and space continue to be absent or weak in Pakistan. Many countries undergoing economic development and structural transformation similar to Pakistan's, have addressed and resolved such contradictions, but not yet Pakistan. It is not possible to speculate about what would have happened if it had had less corruption and had been more honest, for these are counterfactuals. Pakistan would not be what it is today—for better and for worse—had it not evolved in the way it has, an evolution much determined by given material conditions, existing and past.

1.4 Conclusions

Pakistan's economic development and social change over its first sixty-six years is spectacular, yet commonplace, and in many ways tragic. Compared to what it was in 1947, the country seems like a modern, dynamic state—unlike, say, Afghanistan. Compared to other countries, such as the south-east Asian countries of Malaysia, Thailand, and South Korea, Pakistan's achievements look minuscule, and numerous indicators of failure emphasize such distancing. Pakistan would necessarily have grown from whatever existed in 1947, as the country had skilled labour and sufficient natural endowments. It could have grown much more, given its own potential and the performance of other comparable nations. Although important directions can be given to the process of history governing nations, and critical decisions can have dramatic consequences, either positive or negative, there is a logic to history itself that governs and determines the course of society and of nations. Comparisons with other countries to deduce 'what could have been done' or how to go about development, often ignore elements of *specificity* and *contextuality* on the one hand, and chance and randomness on the other. Many events in history, outside the control of those whom they affect, have altered the course of nations, and we see that far more in the case of Pakistan than many other countries. Hence, comparisons and evaluations need to be considered in relevant contexts, given specific histories.

Yet there are generalities as well. All nations belong to, and are part of, the global economy, and increasingly so. They cannot avoid the influences—both negative and positive—of this integration. Their destinies are often closely linked with those of others, and by being part of the world order, they have the ability to learn much more from each other, and at a greater pace. With the communications revolution, physical integration is no longer essential, and influence and trends cross political borders, bringing markets and people together. Comparisons and attempts to emulate become easier.

This first chapter has tried to answer the difficult question of whether Pakistan—as a people and as a nation—is better off today than in 1947. There is no definite answer to this question. In many ways Pakistanis are far better off than they could have ever imagined; in other important areas, they have not even begun to address the issues that a country at the level of Pakistan's economic, social, and political maturity should have resolved (see Table 1.3 for Pakistan's 'indicators of failure'). Pakistan could have done far better than it has, as has been shown by the performance of other comparable countries. That it has not implies a certain level of failure. But then again, given constraints and initial endowments and material conditions, and the interactions of different social and political classes and groups, perhaps this was unlikely.

However, when we do compare Pakistan with countries in the region—Bangladesh and India, for example—the prospects for Pakistan increasingly look far worse than for these two countries. Perhaps Pakistan has been left behind, in terms of economic development now by India, as it was in the 1960s, by South Korea. With greater globalization where human capital and domestic conditions—democracy, peace, law and order—increasingly play a critical role in development, Pakistan's future prospects do not look promising. Moreover, one must be more objective in our analysis about making simplistic comparisons between military rule and civilian government in Pakistan, when we know that the latter has been restricted and manipulated by the former, as Chapters 26 and 27 emphasize. Just because growth rates under military rule have been higher than under civilian government, does not imply that military rule is 'better' or preferable to democratically elected governments. As the *Economist* recently reminded all those who have a penchant for supporting the military in Pakistan—and sadly there are too many who still continue to do so—'the regular intervention of soldiers in Pakistani politics has undermined civilian institutions, encouraged the growth of terrorist organizations, distorted spending priorities, and poisoned relations with India'.[7] While civilian governments have numerous failures to their credit, given the fact that it is far more powerful, one must hold the military far more responsible for destroying Pakistan's state, institutions, and society.

We have presented here a 'before and after' picture without giving the 'how, what, and where' of Pakistan's economic development. The rest of the book tries to complete picture, and seeks to understand and explain Pakistan's particular story. The answer to whether Pakistan after sixty-six years has been a success or failure is to be found in the chapters that follow.

2. Reza Ali's seminal unpublished work shows that perhaps 98 per cent of the Punjab lives within two hours of a city, and 82 per cent about one hour away. His assessments based on the 1988 Census, of fifteen years ago and when so much has changed, suggests that approximately 74 per cent of the Punjab was urban, Sindh 53 per cent, Khyber Pakhtunkhwa 45 per cent, and Balochistan, mainly Quetta, 12 per cent. Since 1998, urbanization has increased at a much faster pace.

2 Is Pakistan Feudal? A Historical Account of the Development of Agriculture in Pakistan

There is a general perception held by many within Pakistan that, even in the twenty-first century, Pakistan is a 'feudal' country. This view is endorsed by political scientists, observers and journalists, the electronic media, and lay people in general. It assumes that in the economic, political, and social arena, Pakistan and Pakistanis have 'feudal social relations' and are 'feudal in attitude'. The label 'feudal' is pasted on to anyone owning large tracts of agricultural land, and even on rich urban dwellers who seem to have no known or apparent source of income to support their ostentatious lifestyles. Essentially, the popular image from film and television is of a feudal as someone who lives in luxury, often, but not necessarily, having an agricultural background. Politicians, especially, are considered to be from feudal backgrounds, and even the more sensible magazines and newspapers endorse the impression that the national and provincial assemblies in Pakistan are predominantly full of 'feudals'.

This chapter, the first of four on the agricultural sector, will try to assess the claim that Pakistani agriculture, and hence Pakistan, is feudal. We will recount the history of agricultural development in Pakistan from the pre-colonial Mughal times and examine the consequences of British rule for the social and economic relations of production within agriculture. This narrative will summarize the changes that have taken place over three centuries and culminate with a picture of the agricultural sector at the time of independence in 1947. The next chapter will develop the story of agriculture in Pakistan, explaining how the process of the development of agriculture continued after Pakistan came into existence.

A recurrent underlying theme of this book is that one needs to examine the present as well as the past. In other words, we need to see the present as a part of the historical process from which it may have evolved, and to which it may be linked. To some readers it may seem a little irrelevant that in a book about economic issues in contemporary Pakistan we begin the first substantial chapter with a history that goes back four centuries. We have argued in the Introduction why this is the manner in which issues should be discussed, and that this is the pattern adopted in this book. In addition, the question of whether Pakistani agriculture is feudal or capitalist has important economic, social, and political ramifications. The nature of agriculture has important repercussions not only for agriculture, but also for numerous related and distant sectors within the economy. This point will become clearer as the narrative progresses, especially when we discuss the social, political, and economic consequences of the Green Revolution. Suffice it to say that it is important to observe how societies change, especially when they are transformed from one major historical epoch (or mode of production), feudalism, to another, capitalism (see Boxes 2.1 and 2.2). This chapter will do precisely that.

2.1 The Development of Agriculture before the Consolidation of British Rule

Some social scientists believe that pre-colonial India was a stagnant society with little progress taking place and rigid economic and social structures, and that it was only British rule which awakened the Indian subcontinent from its slumber. They believe that, had it not been for the positive and modern impact of British colonialism, most of South Asia would still be backward and perhaps still stuck in the nineteenth century. On the other hand, there are other social scientists who believe just the opposite. For them, the modernizing impact of British colonialism was debilitating and cruel, and they feel that the underdevelopment that we see in the South Asian subcontinent today is a result of that colonial impact. These are different ways of reading into, understanding, and interpreting history, and each individual has the privilege to reach his or her own conclusions. Here, we briefly present an outline of the nature of agricultural production before the conquest of India by the British.

India was a pre-capitalist social formation prior to the British conquest. There is some evidence of development and change in a society that was essentially pre-capitalist, and some writers have suggested that this movement was towards capitalism.[1, 2]

During the pre-British period, under the Mughal Emperor, all land was owned by the king alone. There was no private property in land, and permission for the use of land was granted by the king. In 1647, the ruling class comprised the Emperor and about 8,000 *mansabdars* or nobles who were supposed to maintain large armies to serve the Emperor whenever he so required of them. These *mansabdars* were either paid salaries in cash or, as was more common, were given *jagirs* or large tracts of territory in which they were responsible for collecting revenue from the peasants and then transferring it to the state. Such *jagirdars*, or revenue collectors, were transferred from one area assigned to them for the purposes of revenue collection to another, usually after three or four years, so that they did not have the opportunity to build entrenched bases for themselves. While *jagirdars* were essentially officials rather than feudal lords,

Part 1

Agriculture

Agriculture has been the mainstay of the Pakistan economy for many years, although in recent years, its importance has somewhat declined. From a contribution to gross domestic product of more than half in the 1940s, today it accounts for around only 21 per cent. The share of employment in agriculture has also fallen, from more than 65 per cent of the labour force in 1950 to about 45 per cent today. The two most common perceptions held by students and observers of the Pakistan economy are that Pakistan is mainly an agricultural country and that Pakistan's agriculture is 'feudal'. The four chapters on the agricultural sector in Pakistan deal with these two commonly held myths. In Chapter 2, an attempt is made to trace the history of the development of agriculture in Pakistan, questioning the claim that the mode of agricultural production in the country is still of a feudal nature, a perception which is repeated *ad nauseum* by numerous commentators, both local and foreign. Large landowning patterns are often confused with feudalism leading to misperceptions. Chapters 3 and 4 develop the theme of the transition of the agricultural sector, arguing that a more capitalistic and capital-intensive agriculture now dominates. Chapter 5 highlights the key issues that currently exist in the agricultural sector and, given the diminishing contribution of agriculture to the overall economy, suggests that perhaps Pakistan's economy is no longer mainly agricultural nor 'feudal'. Moreover, as has been argued in the Introduction and in Chapter 1, with the 'urban' set to define Pakistan more markedly, along with the rise of a vocal middle class, issues related to the agricultural sector will need to be redefined. Nevertheless, one cannot dismiss the agricultural sector completely, especially since interventions by the government between 2008 and 2013 continue to have major consequences.

Box 2.1

What are Modes of Production?

Doug McEachern writes:

For our purposes, it is sufficient to recognize that the term 'mode of production' refers to those relations that exist at the heart of a given society, identify the major classes of that society and indicate the inherent logic of the relations and conflicts between those classes. In all societies we may identify means of production, direct producers and a relevant class of non-producers that combine in a process of social production. Production is also surplus production and surplus extraction; that is, the process of production also constitutes a process of class exploitation. The relations generated in the production process assume a different character in societies dominated by different modes of production. The problem is to suggest the different character of these relevant direct producers and non-producers and the forms of the relationships between them.

The modes of production identified by Marx can be codified as follows: *Primitive Communism* is a mode of production in which the means of production (low level methods of hunting and agriculture) are dominated by some form of communal institutions which organize production and distribute the surplus. *Feudalism* is a mode of production in which there is a partial separation of the direct producers from the means of production (largely the basis of agricultural production, land and the means to work that land). *Capitalism* is a form of society in which the direct producers have been separated from the means of production. These now exist as the private property of a class of non-producers. These outlines do not indicate all the ingredients of the modes of production. It is also necessary to show the way in which the various classes relate to each other through their relations to the means of production in the processes of production and surplus extraction. In primitive communism the problem is less obvious. Through membership of the community one has access to the means of production and the production process. On that basis, means of survival are acquired. Under feudalism, the situation of divided ownership, but with a dominant position (especially over the ownership of land) going to the non-producers, production and surplus extraction is organized through rent and tax relations. (It is incorrect to see a division between the process of surplus extraction and the domination of the means of production. The direct producers do not control the production process and the surplus is not extracted by external, essentially non-economic relations). Under capitalism, the form of association is through wage-labour and surplus is extracted through surplus value relations and based on the separation of the direct producer from the means of production. Further, each mode of production has a characteristic state form. Primitive communism is a society without classes and without a state as such, although state-like functions are performed by other means. In feudalism the state and the process of surplus extraction are closely interconnected; the state is involved both at a national level and in the local process of production and accumulation. Under capitalism, the state is formally separated from the economy, centralized, bureaucratic and concerned with relating (mediating?) the relations between the economic and political spheres of society. Although different state forms appear to coincide with different modes of production, it is open to dispute whether the form of state is part of what constitutes a mode of production.

another category of assignees, the *zamindars*, bore a closer resemblance to the concept of feudal lord. *Zamindars* were also responsible for collecting revenue on behalf of the king, and were usually amongst the influential individuals from the villages. The Mughals had established a strong and elaborate revenue system under Akbar in the 1570s. Besides these two mechanisms for collecting revenue, there were also *khalisa* lands, from which land revenue accrued to the state directly.

The *zamindar* was the local lord and (feudal) master and had an obligation to the state to collect revenue and turn it over to the Emperor. Although he did not own the land, in many ways he had the characteristics of a feudal lord (see Box 2.2). He was the supreme lord at the village level, the 'linchpin of the system'. He used coercive force and extra-legal methods to extract revenue. He also presided over all social and judicial matters at the village level. Although he was appointed by the Emperor, he exercised complete authority at the village level. Here, there was a fusion of economic and political power at the point of production.

Under the Mughals, as all land was owned by the king, there was no question of land being inherited by either the peasant's family or the *zamindar*'s. There were no occupancy rights that could be alienated or mortgaged, although some transfer within villages or families did take place. While *zamindars* and *jagirdars* were in a position to assert authority over assigned tracts of land, their position was dependent on the favour of the ruler. In many cases, the right to collect revenue after the death of a *zamindar* was passed on to his sons, but this too depended on how much the Emperor wished to retain the status quo.

Soon after the death of Aurangzeb in 1707, the Mughal empire began to decay and fall apart. As central authority weakened, there were contending claimants to power. The *zamindars* and *jagirdars* who were the intermediaries in the Mughal system became more entrenched where they could, and tried to strengthen their claims on the land and increase their hold on the peasants.

Box 2.2

What is Feudalism?

Most people, when they use the terms 'feudal' and 'feudalism', do so rather loosely. They forget, or do not know, that 'feudalism' is an economic concept and that, when we talk about feudal relations, we usually mean relations, whether social or economic, based on a number of economic criteria. There has been continuous debate about what exactly feudalism entails. A number of historians and scholars have examined the conditions mainly in Europe before the Industrial Revolution, and have identified certain economic features that define feudalism. We present below a list of components or properties of the feudal mode of production which gives us some flavour of what the concept of feudalism entails. Feudalism is a concept that relates specifically to the agricultural sector. Hamza Alavi has explained the five criteria that constitute feudalism as follows:

i) *Unfree labour* rendered not necessarily in the form of labour services but taking a variety of possible forms. That would be contrasted with free labour in CMP [capitalist mode of production], in a double sense (a) in that it has been separated from (or 'freed') from possession of means of production (land) and (b) that it is free from feudal obligations to serve a lord; the direct producer is now free to sell his labour power or starve.

ii) *Extra-economic coercion in the extraction of the surplus* from the direct producer, as against economic coercion as the basis of exploitation in CMP.

iii) *A fusion of economic and political power at the point of production and a localized structure of power*, as against separation of economic (class) power and political (state) power within the framework of a bourgeois state in CMP. The power of the exploiting class, the bourgeoisie, over the exploited class is then exercised indirectly, through the state apparatus and subject to the rule of (bourgeois) law, and not exercised arbitrarily and directly as in FMP [feudal mode of production].

iv) *Self-sufficient ('subsistence') economy* of the village (or the manor), commodity production being secondary for the direct producer; subject to the condition that he produces also a surplus that is appropriated by the exploiting class of which a significant proportion may enter into circulation as commodities. That contrasts with generalized commodity production in CMP where (a) production is primarily of commodities, i.e. to be sold for the value to be realized on the market and (b) labour power itself is a commodity.

v) *Simple reproduction* where the surplus is largely consumed by the exploiting class which acquires it, instead of being accumulated, so that the economy and society merely reproduce themselves on the existing level of productive resources and technology, whereas in CMP we have expanded reproduction of capital, where the surplus is primarily deployed towards capital accumulation (although not without supporting rising consumption levels of the exploiting classes) and consequent expansion of the forces of production and technological advance.

Source: Alavi, Hamza, 'India: Transition to Colonial Capitalism', in Alavi, Hamza et al. *Capitalism and Colonial Production* (London: Croom Helm, 1982), 29.

Two other explanations of feudalism are also given below:

a) D. N. Jha argues:

The word 'feudal' or 'feudalism', often traced to the *feos* occurring in Burgundian charters from about 881, came into a general use during the Enlightenment and the French Revolution when it stood for what appeared to be a body of irrelevant and obnoxious practices inherited from the *ancien regime*. It was, again, during this period that there took place a certain bifurcation in the meaning and uses of the word 'feudal' or 'feudalism'—a bifurcation which has persisted to this day and has influenced historical writings and to which attention has been pointedly drawn by David Herlihy (*The History of Feudalism*, New York, 1970, xiii-xxi). Some historians have thus viewed feudalism as an agglomeration of institutions connected with the support and service of knights and as a system of law, government and of military organization, whose central feature would appear to be administrative decentralization. Indian historians have sometimes been influenced by this concept of feudalism and they have often used feudal terms to describe a situation of parcelized sovereignty. . . .

As against the concept of feudalism as a system of government, the school of Marxist historians has equated the feudal phenomenon with a mode of production based on 'feudal rent' which subsumes the existence of a class of landlords (landed intermediaries), a basic class of producers (peasants) with a special connection with the land which, however, remains the property of the former, and of the overwhelmingly self-sufficient agrarian economy with little scope for the functioning of a market system. The study of feudalism within this frame of reference focuses attention on serfdom and various other forms of constraints on peasant freedom. In India these aspects of feudalism have attracted the attention of historians like D. D. Kosambi, R. S. Sharma and B. N. S. Yadava who, however, have not remained uninfluenced by non-Marxist scholarship. Kosambi, for example, speaks of 'feudalism from above' as being the first stage in the development of feudalism in India—a stage which corresponds to the orthodox view of the phenomenon as a system of government. Sharma and Yadava emphasize serfdom and immobility, subjection, economic bondage and unfreedom of the peasantry, and yet both devote considerable space to feudalism as a system of government.

Box 2.2 (Continued)

What is Feudalism?

b) A Chinese historian shows what feudalism meant in medieval China:

The feudal system is founded upon agriculture and handicrafts conducted within the boundaries of the local community (*difang gongtongti*). A single village or a number of villages constituted the local community which possessed in common forest and pasture land, water resources and arable land. In this local community the common land and the fields which were distributed among the peasant households provided the necessities of life; for instance, the fields, hunting and fishing, and domestic animals (provided the necessities for consumption) while materials such as timber and sheep wool provided the raw materials for household industries. This kind of local community was ordinarily *a self-sufficient economic organizm and had little economic interchange with the outside world*. The local lord nurtured within the community awe for his powers. The king was only an elevated lord and did not have the power to subject other lords to his will; hence the feudal state had an extremely loose organization.

2.2 The Impact of British Colonialism

> With the start of active colonial expansion in South Asia in the middle of the eighteenth century, the British established either direct or indirect control over the greater part of its territory by the end of the century. Spreading the sphere of their political influence in the direction from the east (out of Bengal) towards south-west and north-west, they stopped in the case of the latter direction at the lines that closely fit the present-day frontier between India and Pakistan. The north part of these lines coincided with the confines of the Punjabi Kingdom, and the south one with the boundary of Sindh with the authority of feudal rulers from a Baluchi clan of Talpurs to be established there by that time. A distinctive feature of the north-west regions was predominance of Moslem population.[3]

There is little disagreement among social scientists about the proposition that profound changes were brought about in the character of Indian society following the imposition of British rule. For our immediate context, three institutional changes introduced by the British had important consequences for landholding and agricultural production. The institution of private property, as the British understood it, was introduced in India in the late eighteenth and early nineteenth centuries. At the same time, a legal system was established that was closely related to the ownership of property. And thirdly, the British established an 'efficient government'.[4]

Hamza Alavi analyses the impact of these changes and says:

> The main impact of the change brought about by the colonial dispensation was the elimination of petty sovereignties of chieftains and *zamindars* who *ruled* the land, as much as they owned it. *Thus the 'fusion of economic and political power at the point of production', that we identified as a structural condition of feudalism, the power of the landlord over the peasant, was dissolved and was reconstituted in the form of bourgeois landed property, under the authority of the colonial state which marked a separation of economic and political power*. The most important turning point in the evolution of new system of landownership brought about by the colonial regime was the 'Permanent Settlement' in Bengal (of land revenue obligations) of 1793 which was instituted in conjunction with fundamental changes in the rural social and economic structure. The peasant was dispossessed of the land which now became the 'property' of the zamindar. Concomitantly the direct coercive powers of the zamindar (and his private armies) were abolished.[5]

The multiple claims that had emerged following the decline of the Mughal empire were 'systematized and unified' under the British all over India. The Permanent Settlement in Bengal in 1793 conferred property rights in land on the revenue collectors who were found as intermediaries between the cultivator and ruler. With the decline of Mughal rule, zamindars took over *de facto* possession of land. 'The British in their first settlements then granted to this zamindar a property right that in their judgement would be stable and ensure the collection of their revenue demand through him.'[6] Essentially, then, we have the beginnings of the concept of private ownership of land and of private property, protected by a legal system that recognizes these property rights.

This imposition of the legal concept of private property and ownership of land was a major step forward in transforming the indigenous society in the direction of a bourgeois, capitalist society. The British introduced the institution of the alienation of property in land by virtue of bourgeois civil law proceedings. With this, the principles of inheritance, guaranteed rights, and the privilege of succession were implemented.

Sindh was annexed to the British empire in 1843. The British 'made their first settlements on the basis that land was held directly from the state on a tenancy basis but its security was guaranteed. Payment of land revenue was a condition for the usufruct of land. The occupant was given heritable and

transferable rights of occupancy. The land system was called the *ryotwari* system in which the state was the landlord and the occupant was its ryot or tenant.'[7] At the other end of the spectrum, the British granted ownership rights on large tracts of land to the Mirs as *jagir* lands. Other influentials were also awarded similar grants, so long as they provided services of some sort to the new rulers of India. These owners of large tracts of land became the landlords of Sindh.

Apart from these important changes in the relationship between land and the intermediary or owner, the British were responsible for numerous other changes which resulted in agriculture developing on capitalist lines. The introduction of the monetary tax, and the fact that it had to be paid regularly and on strict terms, required producers to sell their crops in the market to pay the tax on land. A market for agricultural commodities emerged, and the previous self-sufficiency and remoteness of villages was shattered. A much greater integration of the rural economy with that of the rest of the Indian subcontinent—and, subsequently, with the economy of imperial Britain—followed, with desolate and far-flung places becoming part of the money and commodity exchange nexus.

These interventions in the agricultural economy caused the cropped area and the marketable agricultural produce to grow. No cotton was grown in Sindh at the time of the British conquest. However, in 1873–4, 4,000 tons were produced, while Punjab's production grew over seven-fold in less than ten years from the mid-1850s to the mid-1860s.[8] Thirty times more wheat was exported from the Punjab in the 1880s than in the 1860s. As the industrial revolution progressed in Great Britain, there was a dire need for raw materials. In the 1840s and 1850s a poor cotton crop in North America produced a shortage of raw cotton for industry in England. It was at this time that British industrial capital urged the imperial government to develop resources to extract further raw material from India. With increased production for the market, the local economy became more integrated with, and dependent upon, the requirements of imperial Britain.

As the commercialization of agriculture continued and as the tax burden began to be felt, many landowning peasants were unable to pay the taxes and had to seek loans from money-lenders and merchants. Some were even forced to sell or mortgage their lands. Zamindars and *jagirdars* were expected to pay taxes on fallow land as well as on cultivated land. As some of them were unable to pay the tax, they were forced to sell their lands. The land of the defaulters was bought up by usurers, tradesmen, and merchants, many of whom belonged to urban areas with little direct involvement in agricultural production.

While these tax laws were strictly enforced, they began to have serious negative repercussions as far as the British were concerned. The colonial authorities felt that the landed aristocracy was the mainstay of their power in Sindh and the Punjab, and the erosion of their economic and, hence, political power was undermining the political strategy of the British. Thus, in Sindh between 1870 and 1890, a series of acts and laws were passed to protect the rights of the zamindars. Earlier, from the mid-1860s in both the Punjab and Sindh, courts of civil justice had come into existence which ensured the compulsory alienation of land in the case of non-payment of debt. The 1870s saw the beginning of the replacement of the initial land taxation code with a revised version under which only cultivated areas were subject to taxation and there was no tax on fallow lands. However, despite this change, in the mid-1890s over 42 per cent of usable land in Sindh either had been appropriated by, or was in the possession of, usurers under mortgages.[9] In the Punjab, the British went one step further. They were quite disturbed about the fact that, due to a debt market emerging and with landlords unable to pay their taxes and loans, agricultural land was going to non-agricultural users. They felt that this would undermine the position of the 'agrarian castes' on whom the British relied. Thus, they implemented the 1900 Punjab Land Alienation Act, which prohibited the passing of land from agricultural to non-agricultural castes and permitted land transfers only within the related agricultural caste group in each district.[10]

From 1885 onwards, the economy of the Punjab began to be reshaped by the considerable extension in agricultural production which resulted from canal colonization after the late 1870s. While the process of building canals took place all over India, the coverage in the Punjab was particularly impressive.[11] In the early years of the twentieth century, a little over half of the entire irrigated area was watered from canals. Within a period of two decades, canals watered about 80 per cent of irrigated land. In the first half of the twentieth century, the rate of expansion in the area of irrigated lands in the territory that now constitutes Pakistan outstripped the Indian region. The area irrigated from water from state-owned canals in the Pakistani territory saw an almost seven-fold increase in the first half of the twentieth century.[12]

The British needed to expand the potential area of agricultural production in India so as to ensure the availability of raw materials for industry in Britain, and for food crops in the Indian subcontinent, where the population was increasing at an alarming rate and the threat of famine loomed large. While early British policy had broken the century-old shackles of rural Indian life, capitalist agriculture was only just emerging. Hence, to increase production, rather than use intensive means, a more expansive form was necessary to bring more land under cultivation. The canal colonization programme was the result of this policy. The British did not want to settle rentiers on the newly colonized lands, and instead were looking for small well-to-do agriculturalists of the yeoman type, who would cultivate their own holdings. Grants were given to peasants to cultivate land, the ownership of which the state had every intention of retaining. These peasant grantees were to remain as occupancy tenants of the state and were not allowed proprietary rights. However, this policy was changed when this landholding peasantry, essentially of the self-cultivator type, was given proprietary rights in 1912.

According to some scholars, the principal change to take place in the first half of the twentieth century in the rural areas of Sindh and the Punjab was the increase in landlordism, which occurred by increasing the number of landlords and the landlord ownership of land.[13] In the Punjab, land ownership became increasingly concentrated,

with large landowners controlling 38 per cent of arable land by 1939 (see Table 2.1). In 1947 in the Punjab, the owner-cultivated arable land comprised about 42 per cent of the total, while the remaining 58 per cent was leased. In Sindh, 80 per cent of the land belonged to big and middle owners of the more traditional landlord type, and was let out to lease. In the Punjab, 51 per cent of the sown area was cultivated on conditions of non-occupancy tenancy. This percentage was much higher in Sindh, where landlord ownership and peasant land-use constituted the most typical pattern of the region.[14]

In Sindh and the Punjab, tillers of land were usually called *muzareen* or *haris*, whose rights to cultivate land under the British were not recognized in law or practice. In the Punjab, some tenants, *maurusi muzareen* (occupancy tenants), did have the law on their side regarding a hereditary right to cultivate land, but such rights were not always respected in practice. In Sindh, while the Mirs were granted *jagirs*, the British had also recognized the rights of tenants who held land owned by the state, and their security was guaranteed as long as land revenue was paid to the state. The occupants of these state lands had heritable and transferable rights of occupancy. This was the *ryotwari* system, where the tenant, ryot, worked on the land of which the state was the landlord (see Figure 2.1).

The zamindar and the *jagirdar* parcelled out land to the *haris* and *muzareen* in lots of 10–15 acres. A manager or *kamdar* used to oversee the work of the tenants. The *hari* was a landless sharecropper 'who traded his family's labour for a share in output which in theory was fifty per cent of the gross produce. He also supplied seeds, implements, and oxen. In addition to the *batai* share, a *hari* paid levies and perquisites, and provided free labour to the landlord. The landlord paid about one-third of his net rental share to the state as land revenue. He usually assigned to a *hari* each year a different block of land to prevent the *hari* from establishing any occupancy rights on a particular piece of land'.[15]

Table 2.1
Structure of Land Ownership in the Punjab Province: 1924 and 1939 (%)

Plots, acres	1924		1939	
	Owners	Area owned	Owners	Area owned
Up to 5	58.3	11.2	63.7	12.2
5–10	18.0	15.1	16.9	13.1
10–15	8.6	12.5	7.3	9.1
15–20	4.3	8.4	3.6	7.2
20–25	2.7	6.8	2.2	5.6
25–50	4.8	20.4	3.9	14.8
Over 50	3.3	25.7	2.4	38.0

2.3 Feudal or Capitalist?

In the previous two sections, an attempt has been made to delineate the main features of the agricultural sector from the period of the Mughals to about the time of the independence of Pakistan. The direction of the discussion has been towards examining the issue of whether Pakistan's agriculture is, or was, feudal or capitalist. To do this, we need to show how the development of agriculture has matured from one historical form to another. If we reach the conclusion that

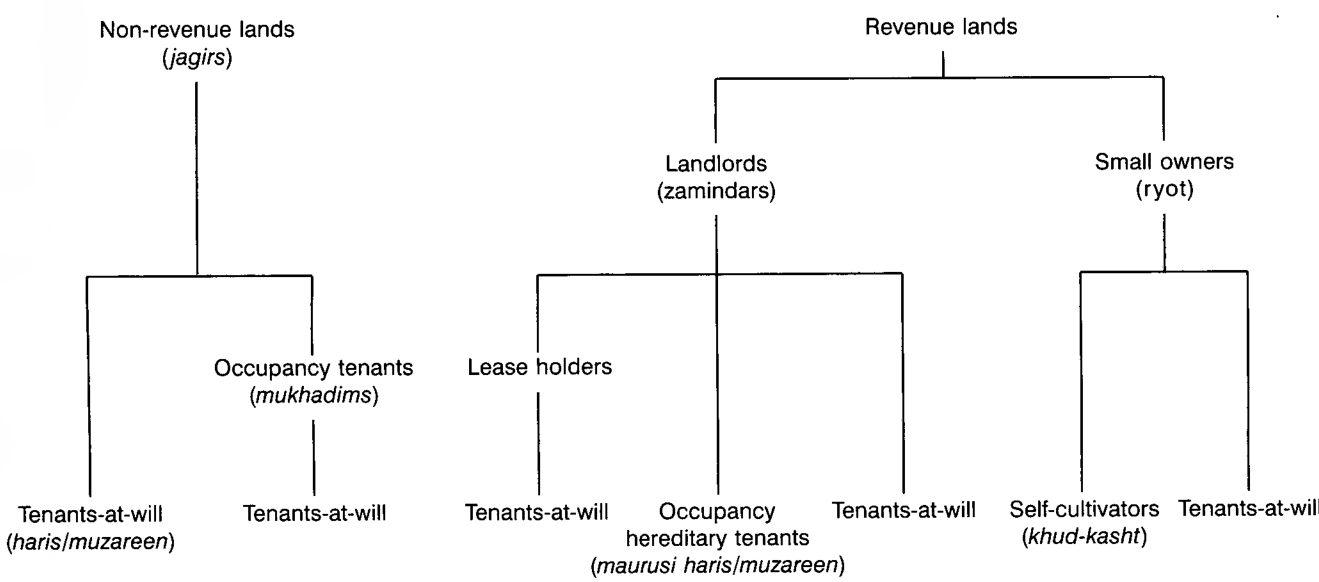

Figure 2.1
The Land Tenure System in Pakistan (circa 1947)

until 1947 Pakistan's economy, particularly the dominant agricultural economy, was still overwhelmingly pre-capitalist, and that capitalist forms of agriculture had not established themselves, then Chapter 3, which examines the post-independence era, will need to evaluate the nature of this transition from one mode of production to another. On the other hand, if we conclude that the transition from feudalism to capitalism took place many decades ago, then we can take up the theme of the development of capitalism in agriculture in Pakistan since at least the early years of the twentieth century. This discussion is important because there are still many observers and students of Pakistan's economy who feel that Pakistan in general and its agriculture in particular are 'feudal'. Let us interpret the evidence.

There is a great debate over the claim that British colonialism initiated capitalism in agriculture in the regions that constitute Pakistan. Imran Ali, who examines the impact of the British on the Punjab, especially with reference to the canal colonies of the province, writes that there was an absence of an agricultural revolution in the region. He accepts the fact that there 'was great economic growth' in the canal colonies, but 'agriculture did not experience any major transition from traditional modes. Quantitative increase was not accompanied by qualitative change.'[16] He argues that, if we look at conventional growth indices such as cultivated area, output, marketing, and trade, we see an 'impressive process of growth'. He adds that the process of agricultural colonization transformed the Punjab 'into one of the most important areas of commercial farming in Asia',[17] with agricultural produce being exported all over the world. Imran Ali also discusses the impact of the extended communications network, especially railways, on increasing agricultural production, and how the monetization of the rural economy was responsible for the greater integration of the backward areas with the rest of the world. However, he concludes that 'capitalistic forms of agriculture . . . did not emerge on any significant scale',[18] and that 'agricultural expansion did not produce a social base conducive to rapid change; indeed, the reinforcement of the existing class structure created, through the very process of economic growth, *a situation that was hostile to an economic transformation*'.[19]

So, for Imran Ali, the conclusion is clear: agriculture remained feudal or at least pre-capitalist under the British and, if anything, the old structures were *strengthened and reinforced* by colonial intervention. This interpretation, which is difficult to accept, is drawn into question by much of what Imran Ali himself describes. For example, he recognizes that 'the process of individualization [of property rights] created, probably for the first time, the prospect of alienation of land rights. With the increase in marketing of agricultural produce, aided by the development of road and rail transport, land came to have a monetary value',[20] and 'after 1880 there was a considerable increase in land sales in the Punjab . . . Agriculturalists entered more into the money economy. . .'.[21] Mahmood Hasan Khan, the great doyen of agricultural economists in Pakistan, shares views somewhat similar to Imran Ali's, writing as follows:

> With the recognition of absentee landlordism, and its protection by the British in the Indus basin as in other parts of India, *there emerged an agrarian system which could not have led to economic development*. The fusion of the feudal rural society and British administration decisively eliminated the chances for positive change in India. The economic surplus which peasants created was appropriated by those in the society who failed to invest in industrial growth. The relative abundance of land was fast disappearing and the peasant population was rising at unprecedented rates, with their consequent adverse effects on prospects of growth and on the condition of peasants. The problem of underdevelopment was intensified further by the growing imbalance between land and population. The British settlements gave birth to an economic and political system which could not get the Indian society in general and peasantry in particular out of the morass of backwardness. *This system reinforced feudal relations on land* which, though asymmetrical, provided a measure of stability for the colonial power to rule India.[22]

Let us now come to a different interpretation, where scholars believe that the colonial influence actually generated and speeded up the process of change in agriculture, from feudalism to capitalism. While there is some debate about the existence of capitalism and capitalist tendencies before the arrival of the British, many scholars believe that the impact of the British was both to destroy and to create.[23]

A critical element that would differentiate capitalist from pre-capitalist forms is the pattern of ownership. We have seen that in pre-colonial times land was owned by the supreme ruler of India, and that after the collapse of the Mughals contending claims surfaced, with ownership being determined by land-grabbing tactics. The British instituted the capitalist and bourgeois concept of private ownership of land, making it marketable and alienable, and introduced a legal system to protect owners and the market, guaranteeing the protection of bourgeois property and personal rights. We would argue that this step was such a radical and progressive departure from past practice that it alone would be responsible for the emergence and growth of capitalist, not feudal, development. Furthermore, the emergence of a land market in the 1860s; the imposition of a land tax which was in cash not in kind, as were other taxes; the establishment of official sources of credit, even long-term credit; the hugely expanded quantity of crops grown, much of them being exported, with cash crops taking an increasing share in production; the increasing polarization between landlords and the growing landless, with wage labour emerging; greater interaction and integration between town and country, breaking away from the self-sufficiency and isolation of the village community; and the advent of small-scale manufacturing, set up near agricultural zones to produce implements that could improve and expand agricultural output—*all point to a conclusive shift from a pre-capitalist to a capitalist type of agriculture*. Importantly, too there was a marked shift away from the fusion of economic and political power at the point of production, which was so

central to feudal power relations, once bourgeois British law and political control over the Indian subcontinent was concretized.

In fact, Vyacheslov Belokrenitsky identifies approximate dates for specific events, highlighting the point that the roots of capitalism had been laid during the time of the British. For example, he points out that a land market had emerged during 1860–70 (29); in the early 1860s, land tax was in cash rather than in kind (42); in the mid-1860s, courts of civil justice came into existence, overseeing the compulsory alienation of land in the case of non-payment of debt (44), and this could have happened only after private property in land had been established; after the 1880s, in Punjab and other areas, the export specialization of agricultural commodities took place, i.e. the agricultural economies joined the world and national capitalist markets, producing for exchange and profit (108); and the first half of the twentieth century saw an increase in the number and share of landless agricultural labour in the countryside, especially in the Punjab, and a key feature of the capitalist form of economy in agriculture, the free worker, emerged and was a fact of life (105).[24] All these factors cast doubt on the claim that feudalism continued to exist well after the establishment of British colonial rule.

A number of scholars recognize the fact that the British colonial influence affected the genesis of capitalism by creating a somewhat 'distinctive form of capitalism', and that the transformation of these non-capitalist societies took place by the domination of capitalism through a process of colonial rule.[25] Belokrenitsky, for example, argues that when in the nineteenth century British rule was established in the regions that became Pakistan, it did not distort the evolution of capitalist relations there, for the latter had not started taking shape by that time. Capitalism that came into existence in that part of the world, under the direct and indirect impact of colonial conditions, was initially a kind of by-product of the policy pursued in India by colonial authorities, and of the influence they produced in direct and indirect ways on the local society.[26]

Moreover, Belokrenitsky argues that the 'development of capitalism as such (or rather of a western economic system familiar to the English) was not directly perceived as a goal of the colonial rule . . . although it was stressed that the coming into existence of components of these practices would be desirable'.[27]

In dealing with the sort of conclusions reached by Imran Ali, discussed earlier, Doug McEachern argues that some researchers have assumed that if the surplus was extracted from the agrarian sector and not reinvested in technology and improved production in agriculture, then the mode of production would not be capitalist. He argues that this surplus can be accumulated in other spheres or even in other countries, as was the case in India, where surplus was transferred to Britain.[28] Moreover, he says that widespread commodity production and the sale of goods for the market (a fact observed in India even by Imran Ali) are 'incompatible with the designation of feudal or unchanged class and production relations . . . such an occurrence is only possible on the basis of a reorganization of production and the generation of a new set of class relations'.[29] McEachern concludes that colonial domination and economic policy initiated the process of capitalist development in agriculture in India. Hamza Alavi elaborates on these themes in great detail and is also clear in his conclusions, arguing that a particular type of capitalism, one tainted by colonial rule, was observed to be emerging all over India. Without question, pre-capitalist forms of production were being replaced by capitalist forms under British colonialism. He argues that:

> what we have in colonized India, therefore, is a capitalist mode of production, *but a capitalist mode of production that has a specifically colonial structure.* One thing is clear. *The feudal mode of production was dissolved* and there is no basis on which we can justify designation of relations of production in agriculture that resulted from the colonial transformation, any more as feudal.[30]

We conclude our analysis that capitalism in agriculture was observed to have emerged in the areas that constitute Pakistan as early as one hundred years ago. The seeds had been planted by British colonization in the early nineteenth century and bore fruit in the early twentieth century. Clearly, huge tracts of pre-capitalist or feudal landholdings, especially in Sindh, continued to exist. But the trend and process was *one conclusively of moving away from feudalism and dissolving pre-capitalist forms of production, replacing them with capitalist forms*. Hence, while feudal practices may have been extensive at the time of independence, and, in fact, may have even been dominant (see Table 2.2 and Appendix 2.1), capitalist agriculture has been the leading trend and it is not possible to label Pakistan or Pakistani agriculture today as 'feudal'. As Appendix 2.2 shows, the myth of feudalism still prevails. However, our interpretation of the facts leads us to believe that, once the transition began and became more entrenched, capitalism soon asserted itself, removing pre-capitalist forms of production, albeit some continue to remain. The next two chapters develop this theme further.

2.4 Popular Perceptions of Feudalism

In the 1980s, there used to be a television serial which became immensely popular called *Waris*, which was based on the life and times of a *choudhry* and his family in the Punjab. The main character was a 'feudal' and the storyline followed the changes that were taking place in his village, how new, modern and urban values and culture were replacing the outmoded earlier values of 'feudalism'. The serial was an excellent articulation of the contradiction which was emerging then between the old world and the new. In the serial, the new world triumphed and the feudal lord was enveloped in flames which led to his death, and presumably, of the old order as well.[31]

For many people in Pakistan even today, the popular perception is that 'feudalism' in the guise of the *choudhry* and *vadera*, still exist, and that Pakistan continues to be 'feudal'. While television serials have moved with the times—perhaps too far ahead of the times—in showing themes which are

Table 2.2
Distribution of Land Ownership in Pakistan and Provinces: 1950–1955

Farm size (acres)	Pakistan		Punjab		Sindh	
	Number of owners	Area owned (acres)	Number of owners	Area owned (acres)	Number of owners	Area owned (acres)
All sizes	5,068,376 (100.0)	48,642,530 (100.0)	3,555,457 (100.0)	28,309,744 (100.0)	337,665 (100.0)	10,285,021 (100.0)
5 or less	3,266,137 (64.4)	7,425,614 (15.3)	2,358,119 (66.3)	4,438,517 (15.7)	100,601 (29.8)	365,817 (3.6)
5–25	1,452,421 (28.7)	15,438,138 (31.7)	1,029,108 (28.9)	11,041,708 (39.0)	155,163 (46.0)	1,937,073 (18.8)
25–100	286,470 (5.7)	10,616,308 (21.8)	146,893 (4.1)	6,198,128 (21.9)	54,792 (16.2)	2,390,358 (23.2)
100–500	57,287 (1.1)	7,671,537 (15.8)	19,401 (0.6)	3,842,986 (13.6)	24,064 (7.1)	2,600,123 (25.3)
500 and above	6,061 (0.1)	7,490,933 (15.4)	1,936 (0.1)	2,788,405 (9.9)	3,045 (0.9)	2,991,650 (29.1)

Note: The data for the Punjab are for 1954/5; for Sindh for 1946/7. The data for Pakistan are the aggregate figures for all provinces. The Punjab includes the former State of Bahawalpur, and Sindh includes the former State of Khairpur.

Source: Khan, Mahmood Hasan, *Underdevelopment and Agrarian Structure in Pakistan* (Boulder: Westview Press, Colorado; 1981), 68.

now predominantly urban and even global, the image of feudalism still persists. Because there is this popular *perception* of feudalism, it becomes even more important to dispel this myth and try to explain why this perception is wrong.

Most people are not concerned with the economic arguments which show that feudalism does not exist in Pakistan today, and they might even be convinced of these economic arguments if they spent some time understanding them. Many of those who even do agree with these *economic* and *structural* arguments turn around and say that there is a feudal 'mindset' in Pakistan and people have feudal 'attitudes'. This mindset and these attitudes are manifest in the following ways: people argue that most Pakistanis are disrespectful of rules, regulations, and laws and flaunt them openly; they misuse their positions of authority and misuse power whenever they get the opportunity; public servants are masters, rather than paid employees of the state, dependent on tax payers' money; women are mistreated, harassed, attacked, and not treated as equals to men; Pakistani society has a *darbar* culture, where ostentatiousness is the norm and privilege is misused and flaunted; patronage from those in power is the norm; corruption, from the *thana* and *kutchery* level to the highest public office in the country, is a standard and even accepted practice; there is a serious law and order problem at the local level caused by propertied and influential people who have their own private jails; there are large landholders and 'traditional' land owning families; nepotism (or bribes), rather than merit, determine access to the public sector employment market; people are supposed to be irrational, and hold outmoded 'unscientific', beliefs; . . . the list is endless. Without a doubt, every single one of these practices is pervasive in Pakistan. Yet, the key question is: Are these manifestations of feudalism?

First of all, let us reiterate what feudalism is and what it is not. Feudalism is primarily an economic system (mode of production, social formation), where the agricultural economy dominates completely; where there is little urbanization; where each unit (village, community) consumes much of what it produces, with little exchange between other settlements and areas. By this definition, Pakistan is clearly not a feudal economy. Also, the size of land ownership does not determine feudalism: farmers, or now increasingly corporate firms, own tens of thousands of acres in numerous countries, but no one calls these owners 'feudals', for the farms are run on the most sophisticated and advanced capitalist lines. So, first of all, the ownership size is not relevant to the feudalism argument. Also, there is a clear distinction between land *owners* and land *lords*, the latter being closer to the feudal model.

Moreover, even if there are *vaderas* and *haris* or *sardars* in some remote villages of Sindh and Balochistan, as indeed there are, and even if they are in an exploitative relationship which fulfils some of the criteria of 'feudalism', this does not mean that 'Pakistan is a feudal country' even though it may have some of these remnants or pockets of feudalism. For an economic system or a country to be 'feudal', the production relations which are specific to feudalism will need to be dominant, pervasive, across most if not all, parts of the country, and only then could one concede that the social and economic system could be called 'feudalism'. As we argue in Part I of this book, this is certainly not the case.

Many people who claim that there is feudalism in Pakistan, argue that there is a lot of 'exploitation' of the poor largely by landlords and landowners in the rural areas and that the poor, often landless sharecroppers and labourers, are treated severely. There is no denying that this is the case in many parts of Pakistan, but exploitation, even brutal exploitation, continues to exist in economies and societies which no

one would consider feudal. The peasants in much of Latin America, for example, have had to suffer oppression for many decades by the military, by landowners, and even by multinational corporations. Exploitation exists in all societies and is not necessarily a trait of feudalism alone. The fact that in Pakistan the law and order and justice situation is so miserable, where the poor (and the not-so-poor as well), whether rural or urban, have recourse neither to justice nor to protection, cannot be reduced to feudalism, for these are characteristics of numerous underdeveloped (as well as highly developed) capitalist societies having no history of anything akin to feudalism. These are manifestations of all class societies with varying degrees of scale.

Although nepotism and the lack of merit and excessive corruption are serious issues in Pakistan, this too is not necessarily a manifestation of feudalism alone. All societies have their version of the Old Boys Club of Oxbridge or Harvard and Princeton, allowing special privileges, unequal access, and benefits which accrue on the basis not of merit alone. Of course these are more abundant in underdeveloped societies, where kin, tribe, *biradari* also matter, but are fairly common in all societies, including the Japanese, American, and British. One allegation that people make in Pakistan is that families rule and dominate institutions, particularly in politics. This is common practice in most underdeveloped countries, particularly in South Asia, where there has been a family hold in the past, but even today, is still not uncommon in the West: the Kennedys, now the Bush family, perhaps in a few years Hilary Clinton as US President. While in the developed societies merit matters far more than connections and lineage, one cannot put everything down to merit alone; cronyism is not a characteristic of poor, underdeveloped, feudal societies alone. The choices of Pakistani voters also show that they do not necessarily vote simply on *biradari* or kinship lines and are far more astute than the credit given to them. Andrew Wilder, in a very interesting book, analysed the way voters elected their candidates in the Punjab, and found that they actually made sensible and rational, perhaps opportunistic, choices, rather than simply vote for someone on the basis of a relationship.[32]

Often vested interests or lobbies or mafias or *qabza* groups, are misconceived as 'feudal' interests. There are lobbies and vested interest in all societies, in some cases they are sophisticated, and in others rather crude and under developed, like their societies. Musclemen or mafias or cartels exist in the most advanced of societies, but only in Pakistan would they be seen as expressions of 'feudalism'. In fact many of these interest groups are a response to modern politics and the way the state functions and fails to live up to its very modern aspirations. Perhaps they are even an antithesis to feudalism. In the former Soviet Union post-socialism, with the breakdown or weakening of the state, there has arisen a new society based on patronage and personalism, and the state has become personalised, with patron-client relations now the new social arrangement in much of the former socialist world. There has been a growth of mafia-like elites and powerful groups that determine affairs, particularly at the local level. Yet, most people would not call these symptoms a sign of feudalism.

The economic changes in structure are also manifested in where people live. In 1951 when the first census in independent Pakistan was held, only 17 per cent of West Pakistanis lived in areas designated as urban; today estimates suggest that perhaps as many as 50–60 per cent live in cities and towns.[33] This shift has major repercussions which affect the economy, society, and the political process underway. In fact, in the context of Pakistan, perhaps the most important political factor over the last few decades, has been the process and extent of urbanization and the emergence, and perhaps consolidation, of a middle class.

Key indicators and trends suggest that Pakistan's agriculture has moved on to capitalist lines. For example, in the case of the share of marketable surplus produced by farms and agricultural units, a huge majority of farms produce primarily for the market, not for self-consumption—in the early 1950s around 12 per cent of produce was marketed, a figure which is now closer to 80 per cent;[34] there has been a marked decline of sharecropping which is being replaced by wage labour; the size of holdings have fallen sharply forcing owners to run farms for profit through production for the market using modern technology; there has been a noticeable shift towards cash crops and fruits, and orchards are now seen as viable economic units; and, commercial, market-oriented farming dominates all forms of agricultural production. Feudalism is no longer an economically viable and feasible project at the farm/landlord level, and many a 'feudal lord' has had to become a capitalist farmer or has then turned to other sources of income. While feudalism in Pakistan died its death a very long time ago, modern day Pakistan has seen the demise of agriculturists as a powerful economic, social, and political force. The old social structures associated with feudals have also been replaced by a market dominated form of existence—particularly, free and mobile labour—something which also explains the rise in poverty in rural areas as discussed in Chapter 22. The huge change in economic, social, and hence, political power, from the agriculturist, so-called feudal, lobby, towards an urban and rural middle class, is also one of the key indicators highlighting the extraordinary structural change in Pakistan in six decades.

What is being emphasized here is that while there are pockets of 'feudal-like' tendencies, feudalism as a dominating and organizing form of social and economic structure is no longer present. While Pakistan still has to develop a modern, democratic and socially responsible middle class and culture, the absence of this social group does not imply the presence of feudalism. With changes in landholding and the rise of the *arthi* and transporter as key economic and political figures in rural areas, and with inheritance laws breaking large landholdings, the old power structures based on land, have changed conspicuously.

What we have tried to do in this section, is to look at some of the characteristics of Pakistani society and show that they are not necessarily either special to Pakistan or to feudalism, and are common, in varying degree, across cultures and social systems. The so called feudal mindset or attitudes, are found in different undeniably non-feudal societies. We also want to state why this discussion here and in this Chapter

on feudalism is necessary. The reason is that when people believe that Pakistan is 'feudal' or that so-and-so is a feudal, or that a particular attitude is feudal, they often reduce their understanding and explanation to everything being 'feudal'. They will then not think beyond this and by putting things in a feudal pigeon-hole, they will sit back and say that this happens on account of feudalism, implying that nothing can be done about this unless feudalism is done away with. But on the other hand, if we argue that there is no feudalism, we are forced to analyse institutions and behaviour in a more serious manner and to examine the real causes of that behaviour or action. Blaming everything on feudalism takes the easy, and in this case, incorrect, path—see Appendix 2.2 on the numerous and different problems in theorizing feudalism.

2.5 Summary and Further Reading

2.5.1 Summary

This chapter has discussed the issue of the mode of production in agriculture in Pakistan. More specifically, it has tried to show that feudalism, despite popular perception, does not dominate production in the agricultural sector. A major reason why people believe that feudalism is prevalent in Pakistan is that they equate large landholdings with feudalism. This chapter has used a common and general definition of feudalism which has very specific characteristics, not dependent primarily on size of landholding. We have argued that, from the time of the British colonization of India, certain structural conditions were established by the imperial government which laid the foundations of capitalist development in agriculture. The rights of private property ownership and inheritance, defended by British civil law, brought forward this new form of production in agriculture. Although 'feudal' enclaves existed at the time of independence, their trend was on the decline, being replaced by an altogether different and new order.

2.5.2 Further Reading

To understand the concept of feudalism, capitalist development in agriculture and the process of transition, see:

Hindess, Barry and Paul Hirst, *Pre-Capitalist Modes of Production* (London: Routledge and Kegan Paul, 1975); Hindess, Barry and Paul Hirst, *Modes of Production and Social Formation* (London: Macmillan, 1977); Hilton, Rodney (ed.), *The Transition from Feudalism to Capitalism*, (London: Verso Books, 1976); Anderson, Perry, *Passages from Antiquity to Feudalism* (London: New Left Books, 1975); Marx, Karl, *Capital*, vol. 1, (London: Penguin, 1975); Marx, Karl, *Grundrisse* (London: Penguin, 1973); and Lenin, V. I., *The Development of Capitalism in Russia*, Collected Works vol. 3 (Moscow: Progress Publishers, 1977).

For material on Pakistan/South Asia, see:

Habib, Irfan, *The Agrarian System of Mughal India* (London: Asia Publishing House, 1963); Habib, Irfan, *Essays in Indian History: Towards a Marxist Perspective* (New Delhi: Tulika, 1995); Hamza Alavi et al. *Capitalism and Colonial Production* (London: Croom Helm, 1982); Belokrenitsky, Vyacheslav, *Capitalism in Pakistan: A History of Socioeconomic Development* (New Delhi: Patriot Publishers, 1991); Ali, Imran, *The Punjab Under Imperialism, 1885–1947*, (New Delhi: Oxford University Press, 1989); Vanguard Publishers, *Studies in the Development of Capitalism in India* (Lahore: Vanguard, 1978); Hamid, Navaid, 'The Process of Agricultural Development: A Case Study of the Punjab', unpublished PhD dissertation, Stanford University, California; and Khan, Mahmood Hasan, *Underdevelopment and Agrarian Structure in Pakistan* (Boulder, Colorado: Westview Press, 1981).

For investigating the issue of feudalism in the South Asian context, the following books will be essential:

Jha, D. N., (ed.), *The Feudal Order: State, Society and Ideology in Early Medieval India* (New Delhi: Manohar, 2000); Sharma, R. S., *Early Medieval Indian Society: A Study in Feudalisation* (Hyderabad, India: Orient Longman, 2001); and Mukhia, Harbans, (ed.), *The Feudalism Debate* (New Delhi: Manohar, 1999). The collection of essays in Mukhia's *The Feudalism Debate* is recommended. The recent publication by Panos South Asia, particularly the contribution by Haris Gazdar, is also .recommended, not just for the discussion on the nature of landownership and the mode of production, but also discussions on agrarian reforms in Pakistan. See, Panos South Asia, *Leveling the Playing Field: A Survey of Pakistan's Land Reforms* (Kathmandu, Nepal: Panos South Asia, 2011).

Appendix 2.1

The Land Systems of Pakistan in 1947

Mahmood Hasan Khan has given a graphic description of agrarian economic and social relations of production in Pakistan at the time of Independence. He writes:

> There were essentially two land systems in the Indus basin, with regional variations in tenurial arrangements, in layers of intermediaries on land and in the degree of land concentration. The dominant among these two was the landlord–tenant system. The other system was of peasant-proprietors or owner-cultivators.
>
> While precise estimates on owners, tenants, etc. are not available for 1947, it is estimated that over 75 per cent of the agricultural population was of peasant-proprietors and tenants in the Punjab and Sindh. It is also estimated that most farms in Sindh were operated by *haris* and they cultivated over 50 per cent of the cultivable area. In the Punjab, over 58 per cent of the cultivated area was farmed by *muzaraeen*. Landownership was highly concentrated in both provinces. Owners of holdings of over 100 acres constituted only 2 per cent and 9 per cent of all owners in the Punjab and Sindh, but they owned 41 per cent and 52 per cent of area in the two provinces. The really large landowners, with holdings of over 500 acres, constituted 0.5 per cent and 1 per cent of all owners, but owned 25 and 30 per cent of the area. . . . Peasant-proprietors, with holdings of 5 acres or less, were evidently more numerous in the Punjab than in Sindh: 67 per cent of all owners in the former and 30 per cent in the latter. However, they owned only 30 and 4 per cent of all area. Most of these peasant-proprietors were in the newly settled and irrigated areas (canal colonies and central districts) of the Punjab.
>
> In the landlord–tenant system, the first group controlled most of the land, although it was small in number. The second group, though numerous, owned no land and enjoyed few if any permanent or recognized rights to its cultivation. The *zamindars* had rights of ownership which were heritable, partible and alienable. Only some *jagir* lands were not heritable. Most *zamindars* parcelled their lands out to tenants in small lots, usually of less than 15 acres. A *zamindar* used an *ahalkar* or a *kamdar* (supervisor) on tenants. He paid to the state as land revenue about 50 per cent of his net rental share in the Punjab (and 33 per cent in Sindh) for each matured crop.
>
> The tenants were mainly landless sharecroppers, who traded their labour and that of a pair of oxen for a return which in theory was about one-half of the crop output they produced on [the] *zamindar*'s land. The tenants supplied seeds and implements and paid water charges, but they did not pay land revenue to the state. The *haris* in Sindh enjoyed no legal rights on tenancy: their contract with *zamindars* was verbal and annual. Similar terms existed for the ordinary *muzaraeen* in the Punjab. For *maurusi muzaraeen*, their tenancy rights and contract with *zamindars* were to be regulated by the Punjab Tenancy Act of 1887. The conditions of occupancy for these tenants were by no means easy to fulfil in practice, reducing their status to that of tenants-at-will.
>
> There were then two basic features of the landlord–tenant relationship on land, namely (1) the *batai* system, and (2) the temporary tenure a tenant held at the pleasure of his landlord, who at least in Sindh regulated the tenancy by a system of shifting cultivation. The *batai* system had two parts. First, there was the distribution of crop shares between landlord and tenant on a 50:50 or 40:60 basis. Second, a *zamindar* charged his tenant *abwab* or *huboob*, which ranged in number from five to twenty. Their number depended on tradition in a particular area. Their total bite on a tenant's share varied from about 5 to 30 per cent. Many tenants-at-will were also required to provide *begar* to *zamindar* on demand. In Sindh, a *zamindar* assigned to a tenant each year a different parcel of land, supposedly to rotate crops in a water-scarce agricultural system.
>
> In disputes arising from the *batai* system, no legal protection existed for the landless tenants in any area. Even in the case of occupancy tenants in the Punjab, where such legal protection did exist, the political influence of a *zamindar* with revenue officials at the local level determined the outcome of disputes. Like much else, the *batai* system was maintained by the power of *zamindars*. More significantly, this system of crop sharing militated against the development of agriculture as it was unjust to tenants in the extreme. There existed no incentive for the tenant to expand production. By the same token, it did not create any pressure on the landlord to undertake investment to make crop production more efficient. With the ownership of large landed estates concentrated in the hands of these *zamindars*, it encouraged absentee landlordism. The transfer of surplus from the tenant to the *zamindar* was ensured by the social and political power enjoyed by landlords in the society, buttressed of course by the legal and administrative structure of the state.
>
> Peasant-proprietors played an important role only in the newly settled areas of the Punjab. Many of these cultivators had lost their lands to moneylenders. Those who survived faced a new menace resulting from increased fragmentation of holdings. Fragmentation of holdings intensified because of rising population on land and operation of the customary law of inheritance among Muslims. In some areas, many of these small owners could not sustain their families entirely on their own holdings. They became progressively tenants as well. So their existence was only slightly less precarious than of the landless tenants.
>
> Differences though there were between the Punjab and Sindh provinces, the rural scene in the Indus basin was dominated by two factors. Most power resided in the hands of those who were small in number but whose economic contribution to agricultural output was that they owned and controlled large tracts of land. Most peasants, on the other hand, were landless tenants and small owners. The tenure of the landless tenant was tenuous and the existence of small owner was only slightly better. The asymmetrical relations in this predominantly landlord–tenant system were maintained

and reinforced by the monopoly power of the absentee landlords and supported by the state. The characterization of tenants, no matter which source one cares to select among many, clearly established them as cultivators who had low economic and social status and whose surpluses were transferred to a dominant class of rulers, the *zamindars*.

Haris Gazdar provides a complementary analysis with specific focus on the Punjab and Sindh under the British.

Punjab

In Punjab (and settled NWFP), the colonial administrators decided to implement the *mahalwari* system of land revenue. This system was based on recognizing the village as the basic unit of land administration. The *mahalwari* system was in place in the western parts of what is now Uttar Pradesh, and Punjab was seen as an administrative extension of north-central India. The introduction of *mahalwari* in the later additions to the Bengal Presidency came after an acknowledgment on the part of the colonial government that the earliest land revenue systems (the zamindar-based Permanent Settlement of Bengal) had failed to create incentives for agricultural improvement.

Colonial officials surveying Punjab argued that the village already existed as a coherent and robust unit of land and social administration. What remained to be done was to document local variations and assign revenue liabilities and political responsibility to specific individuals, families, castes, and classes. It was acknowledged from the outset that in some parts of Punjab—notably the south-western region which now constitutes the southern part of Pakistani Punjab—the concept of the village was less well-established than the central and northern regions. Here, the predominant social unit was the well, around which populations were settled.

The village-based system of land settlement had three important features. First, the village was the basic unit of land revenue liability, and hence the basic unit of land holding. Villages could, of course, be shared between several landholders, in which case they shared the responsibility for land revenue, and were recorded as joint holders of the village. The land of a village would include cropped area, residential land as well as uncultivated land in private or collective use. Second, the village register was the record not only of land but of the entire village populace, including landholders, but also tenants, labourers, and people belonging to non-farm professions and trades. Third, the village was treated as the basic unit of administration—not only for the purposes of land revenue, but for all civil purposes.

Land settlement officers were always at pains to point out that their primary task was to identify, record and formalize existing arrangements of land holding and revenue liability. Local variations in the general village model were scrupulously noted and incorporated into district-wise settlements. At least three different types of *mahalwari* arrangements were used. A zamindari village was one where the entire village land was the revenue responsibility of just one landholding family. In villages where families had divided their holdings a *pattidari* arrangement was in operation. There were yet, other villages where it was argued that the entire 'body of the village' was the joint holder of the village regardless of whether or not they claimed common ancestry. Such villages were known as *bhaichara* villages.

In fact, all three types of settlements were variants of landlord villages. The 'village body' was meant to include only those families that claimed to be the possessors of land. The colonial officials used terms such as 'land owners' but it is clear from the records that the institutions of private property did not actually exist. It was the self-acknowledged task of the settlement officials to identify the true possessors of the land and to record them as its 'owners' through their individual or joint ownership of the mahal or the village. The mention of collective ownership in the settlement records actually referred to joint possession among a sub-set of all residents who claimed to be the landlords. It was taken as given that there will be other residents belonging to subaltern castes and classes whose position would be subservient to that of the recognized village land holders. In determining rival and contested claims of village land holding, the revenue officials paid explicit attention to political power, lineage, right of possession through conquest, and caste hierarchy.

Although the stated purpose of the settlement was to assign revenue tax liability, its effect was to confer private property rights in land to various classes of landholders. Before the colonial land settlements, there was no clear notion of the alienability of land. This can be seen from the fact that while discussing the provenance of any particular claim of land holding the key tests were actual possession (existing hierarchy of rights within a village) and the right of possession through conquest (genealogical tracing of invaders), but not any record of sale or purchase. It is not altogether surprising that the alienability of land—or accepting ownership rights of land holders—quickly led to actual alienation of land. Within a few decades of the land settlements the colonial government in Punjab faced protests on the part of the 'farming community' against the debt-induced alienation of land to urban money-lenders. Its response was to enact the Punjab Alienation Act of 1900, which classified rural society into 'cultivator' and 'non-cultivator' castes and tribes, and restricted the transfer of land ownership from the former to the latter.

Individual private property rights, therefore, were introduced in the favour of the landholders, and then modified to protect this same class. The land settlement in Punjab elevated the landholders but marginalized all other rural classes. Agricultural tenants, labourers, and non-cultivating service castes of various types that had traditionally enjoyed claims to the produce of land alongside the landholders were now dispossessed. In the late 19th century the 'non-agricultural' castes made up around half of the total population of Punjab. The majority among these 'non-agriculturalists' comprised the so called 'vagrant and menial castes' that actually performed much of the hard labour within and outside the agrarian economy.

Even among the half of the population that made up 'agricultural' castes, only a minority were landholders—others

were tenants of various types. Thus, the landholders' advantage over other classes which was previously tempered by a system of customary obligations was both magnified and qualitatively intensified when land was legally accepted as their property.

The Punjab settlement was overtly guided by political considerations. The colonial government consciously sought to create a class of loyal landowners consisting of the middle- and large-income peasantry. By freezing the hierarchy actually observed at a given moment in time into a perpetual contract through the creation of private property rights, the colonial settlement put in place considerable hurdles before the subaltern castes and classes. Whereas before the land system would have been subject to negotiation and change in response to changing local economic and political conditions, now the administrative machinery of the modern colonial state was geared towards preserving the particular balance of political power that happened to have prevailed in the mid-19th century Punjab.

Sindh

The *ryotwari* system appealed to the early 19th century sensibilities of British colonial officers for its simplicity and efficiency. Unlike the zamindar-based Permanent Settlement, this system did not recognize or create a class of intermediaries. Revenue liability was affixed to specific plots of land, and this created prefect incentives for cultivators to maximize their output. Unlike *mahalwari* this system also did not require the existence of village communities or the state's detailed involvement in documenting the structure of rights and claims within villages. Initially the leases were for specific periods of up to five years. Subsequent leases were for longer periods. This system promised to be the closest to a market in land. The *ryotwari* system was implemented all over the Madras Presidency and was also adopted in the Bombay Presidency. Parts of the Bengal Presidency too were brought under *ryotwari*. . . .

. . . The problem, of course, was not with the organization of Sindh agriculture. It was what it was, and had served the economic needs of the agrarian classes and the state to a lesser or greater extent. The problem was with the Indo-centric approach of the British colonial settlement which demanded the agrarian structure of a far-off corner of the imperial domain to obediently submit itself to prior administrative categories. Since this was not going to happen, and a decision needed to be taken, the colonial officials developed the thesis that the haari was 'but a serf of the soil'. The Sindh zamindar was recognized as the landholder and cultivator—that is, as the ryot with whom the *ryotwari* settlement could be made. Private property in land had been introduced and its principal beneficiary was the zamindar. At a stroke, the Sindhi haari was actually turned into a serf of the zamindar.

Appendix 2.2

The Myth of Feudalism

This colourful article, written by Ayaz Amir in *Dawn*, re-emphasizes the point that feudalism still causes a great deal of concern to most people in Pakistan. Despite the considerable evidence presented to the contrary, the myth of feudalism prevails.

> There can be little doubt that next to the great buzzwords of corruption, good governance and the environment, the most overworked concept in Pakistan today is that of feudalism. Commentators who have never spent a night in a village or ever set eyes on a patwari, talk freely about waderas and feudal culture, ascribing all the country's political problems to these twin phenomena.
>
> There is a gross misconception at work here because while there is nothing healthy about feudalism (except insofar as it led in Europe to the rise of the mercantile classes and in time to the establishment of democracy), feudalism proper, with its vast landholdings and tenant farmers, is certainly not as widespread or potent a circumstance in Pakistan today as it was, say, in the first two decades of the country's history or as it continues to be in the feverish imaginations of our deskbound political analysts.
>
> About the only regions of Pakistan where we still find large landholdings is the province of Sindh and the Seraiki or the southern belt of Punjab. In the Frontier there were few large landholdings to begin with. If there are any today they must be few in number. In most districts of Punjab—a province which was once the centre of a thriving feudal tradition—large estates are a thing of the past. More than the imperfect land reforms of Ayub Khan and Zulfikar Ali Bhutto, what has been responsible for this development are the laws of inheritance with what were once large estates becoming smaller holdings.
>
> The result of this process is not hard to see. In pockets of Mianwali and Attock districts there are still a few large landholdings. But in the districts of Rawalpindi, Chakwal, Jhelum, Mandi Bahauddin, Gujrat, Wazirabad, Gujranwala, Sheikhupura, Lahore, Kasur, Sialkot, Narowal, Faisalabad and Toba Tek Singh (this by no means being an exhaustive list) there are no big zamindars, the norm in these districts being of small peasant proprietors or farmers with middle-size landholdings. It is true that citrus growers and mango and cotton farmers of central and southern Punjab make fat profits every year. But that is because of the cash crops they cultivate and not because all of them are sitting atop rolling vistas of farmland. In Tehsil Bhalwal of Sargodha district, for example, even small farmers with citrus gardens of, say, 15 or 20 acres are able to get a good yearly return. But that scarcely turns them into feudals.
>
> Not that feudalism, as a form of land tenure, has disappeared completely from Punjab. But it is confined to small pockets—Dera Ghazi Khan (courtesy the Legharis and

Mazaris) and parts of Multan, Sargodha, Bahawalpur and Rahim Yar Khan.

The urban misconception of course is that anyone who looks like a hick, dresses like one, has a rural surname, curls his moustache and rides a Pajero (or as is the case nowadays, a Turbo Cooler) is necessarily a feudal. The Punjab provincial assembly certainly looks like a rural assemblage. But that is because most of its members are from rural backgrounds and represent rural constituencies and not because they are feudals. Just as every Memon, Gujrati or Chinioti is not a captain of industry, every Chattha and Warraich or Malik and Chaudry is not a feudal landlord.

The question raised in discussions about feudalism, however, is not about the size of landholdings but about the pernicious consequences of this phenomenon, with feudalism, in urban discourse, being considered almost synonymous with political power. The argument advanced is that parliamentary democracy has been unable to establish itself on a sound footing because feudals with their retrogressive ways, have a strangle-hold over the assemblies. This is a distorted view of Pakistani politics. Rural interests have a predominant influence in the assemblies simply because, reflecting the concentration of population, there are more rural constituencies in the country.

Feudal influence in politics received a major blow in the 1970 elections when big-name feudals in Punjab tasted defeat at the hands of less well known candidates from the Pakistan People's Party. Later, it is true, Zulfikar Ali Bhutto tried to reverse the process he himself had set in motion by admitting some of the same feudals into the PPP at the time of the 1977 elections. Even so, there was no going back to the politics of the forties and fifties when feudalism automatically meant political power.

Today, in Pakistan few landholders, no matter how big, can make it into the assemblies if they are not supported by one or the other of the two major parties: the PPP and the PML(N). This is true even of Sindh where a PPP ticket counts far more than being a wadera. Jatoi needs PPP support to win in Nawabshah. After several defeats, Mumtaz Bhutto (no small landowner) made it to the Sindh assembly with some difficulty during the 1993 elections. The Pir of Pagaro has been trounced several times by PPP candidates. Indeed, it is a measure of the change in Pakistani politics that with the exception of the Bhuttos in Larkana, Nawaz Sharif in NA-95 Lahore, the Legharis and Mazaris in D. G. Khan and Khar in Muzaffargarh (and possibly Shaikh Rashid in Rawalpindi) few other politicos can claim to have safe constituencies. Even in this list, it is only in D. G. Khan that feudal influence can be seen as the decisive factor for electoral success. The Bhuttos win in Larkana not because they are big landowners (there being other big landowners in the district as well) but because of their famous surname. Even Khar is not quite the big feudal that Tehmina Durrani has made him out to be. The clout that he enjoys in his district is because of his political standing which is quite independent of his landowning status.

The fact, however, remains that in Pakistan today, when political ideology has taken a back seat to the pursuit of power for its own sake, a party ticket alone is not a sufficient condition for election success. In order to produce the desired results it must be matched with local influence. So the question really is that if feudalism is a waning force, what are the other factors which make for rural influence in Pakistan today?

There is none more important in this respect than the ability to interact with the local bureaucracy: the police, the magistracy and the revenue department. The administrative system in Pakistan is riddled with corruption and inefficiency. If it responds to anything it is to graft and influence-peddling. In order to win the kind of influence which can later be translated into votes, a politico first has to be 'available' to his constituents, the days of absentee politics having long gone in Pakistan. But availability is of use only when the politico concerned is wise to the politics of *thana*, tehsil and *katcheri*. At one time it was mostly the feudal who performed this role. Nowadays his place has been taken by other representatives of the rural gentry: those who have disposable incomes because of their cash crops or those who have made money in other fields: transport, construction, light industry, the Gulf, etc.

So, if anything has to be reformed or changed it is not just the remaining bastions of feudalism, but the administrative system which still puts a premium on a feudal style of politics. As long as the administrative system continues to function in its present groove the rural population will understand local power-brokers better than candidates who may otherwise be better qualified to speak glibly on national and international issues.

This is not to say that with the breakdown of feudalism Pakistani politics have become more egalitarian. That is far from being the case. It is only in this that the nature of the Pakistani oligarchy has changed. It is no longer neatly divided into the bureaucracy, the military and the landowning class as it was for the first decade of the country's history. Today all these various segments (plus high finance and industry) have come closer to each other through inter-marriages and a commonality of economic and political interests. Retired generals and bureaucrats are landowners and captains of industry. Former landowners are industrial barons. The old industrial houses have married into the old feudal aristocracy. A new moneyed breed has entered politics. The old familiar societal distinctions, therefore, have lost much of their validity.

If the cause of egalitarianism has to be served then the enemy is not just feudalism (which in any case, as I have tried to show, has lost much of its traditional power) but an incestuous oligarchy which dominates social, political and economic life in the country. To keep the focus of public anger only on the Pajero-riding rural politico is to ignore the evolutionary complexity of this elite whose depredations have brought the country to its present sorry pass.

Appendix 2.3

The Complexities of Conceptualizing and Theorizing Feudalism

Do all societies follow a universal historical process, or path of development, moving through stages of an ancient, primitive, slave, feudal, and capitalist trajectory? Is the European model of history universal? The extracts presented here, all from eminent historians who have contributed to the edited volume *The Feudalism Debate*, throw some light on feudalism and on method in historical analysis.

1. Whenever we discuss the question of feudalism in any country and in any period, medieval Western Europe inevitably provides the point of reference for such a discussion, whatever be our answer to this question. One can, of course, see the justice of comparing the history of other countries with that of Western Europe in modern times for it was, after all, in Western Europe that capitalism arose which was later to encompass the whole world; but it is difficult to see the logic of such a comparison in the ancient and medieval periods when it might only persuade us to ask questions which have so little relevance to our history.

   It is possible, of course, to speak of regional variations of feudalism. One could thus argue in favour of an Indian feudalism, a Chinese feudalism, a West Asian feudalism, etc. apart from the West European and the Japanese one. However, I visualize two reservations with respect to this argument. First, the use of a common denominator for the whole range of regionally and temporally variant socio-economic systems could hardly be justified unless one could establish a fundamental similarity underlying these variations—a similarity that was precisely defined. Second, quite apart from the fact that feudalism as a category achieves universality only through the looseness of its definition, the very search for a universal category, equally applicable to different medieval regions, is based on the assumption that the medieval world was one world sharing a common socio-economic system. We thus attribute to the medieval world characteristics which more appropriately belong to the nineteenth and twentieth centuries.

---

2. Rather than work out the implications of their analysis, Chinese historians, in their loyalty to a universal teleology, continue to introduce by the back door standards of development derived from European history. This is most evident in the preoccupation with the 'sprouts of capitalism' which implies that even if China had its own 'special' laws of development, Chinese development nevertheless anticipated the universal goal of historical development: capitalism. In spite of its 'special' development, therefore, feudalism in China is portrayed as the stage prior to capitalism in a universal model of development. The result has been to enlarge the concept to encompass all pre-capitalist agrarian society. . . .

   . . . Problems of the Chinese conceptualization of feudalism are not peculiar to Chinese historical discourse but are universal problems of the discourse on feudalism. These problems are products of what Isaiah Berlin has described as the 'inflation' of concepts, the accretion of new meanings to a concept as the concept is made to correspond to the different realities which it is used to represent. Feudalism certainly has undergone such inflation as it has had to accommodate widely different realities in its worldwide diffusion. These problems exist no matter whether we speak of Chinese feudalism, Japanese feudalism, Latin American feudalism, African feudalism, Russian feudalism or whatever. In order to describe these societies as feudal, it has been necessary on the one hand, to ignore significant structural differences among them, and, on the other hand, to inflate the meaning of feudalism to accommodate such structural differences. Feudalism has come to describe anything from a European political-economic institution to all post-slave pre-complaint agrarian economics.

Source: Dirlik, Arif, 'The Universalization of a Concept: "Feudalism to 'Feudalism' in Chinese Marxist Historiography", in Mukhia, Harbans, op. cit., 169.

---

3. In the case of Marxism, however, the assumption that history must develop through a number of stages imposes more serious restrictions on historical analysis. Since feudalism must precede capitalism as a stage, a society that exhibits 'capitalist' elements but cannot be categorized as capitalist must by definition be a feudal society. This lack of alternatives lies at the root of the circular and contradictory arguments that while China was a 'special' feudal society because it never made the transition to capitalism, it was a special feudal society because it contained important capitalist elements.

   This is a general problem of the Marxist conception of history as a succession of internally related modes of production culminating in capitalism and, ultimately, socialism. Whether or not Marx intended European development to be universalized into a global model of development, which is debatable, Marxist discourse has been guided by this assumption. The only alternative to this unilinear scheme of development has been provided by the notion of Asiatic society which, as Western and non-Western Marxists have recognized, is the product less of theory than of a Europe-centred culturalism. Whether because of the imposition of a European model upon the rest of the world, or because of the culturalist exclusion of non-European societies from general theoretical considerations, Marxist models of development have proven deficient outside of Europe.

Source: Dirlik, Arif, op. cit., 176.

---

4. The most serious reservation I have on this approach of comparative study of societies lies in its Eurocentricism. Why should Europe be accorded the privilege of providing yardsticks with which to compare non-European societies? Why should one use such terms as 'seigniorial rights', 'serfdom', 'sub-infeudation', 'manorial', etc. as Sharma, for example, does, in a way begging the question of similarities? Why should one not try to understand European society in terms of, say the caste system, zamindari, etc? Surely, one will find family resemblances in European institutions of these purely Indian types?

3 The Green Revolution and Land Reforms

It would be fair to say that one of the most important events in Pakistan's agricultural history, with extensive repercussions on other sectors, has been the process called the Green Revolution, which occurred in the mid-1960s. The technology package associated with it generated major changes in the economic, social, and political structure of the country, transforming the agricultural and rural sectors irreversibly. Much of what we see today, in terms of economic and social groups and classes, political affiliation, and even culture, has its roots in, and is a consequence of, the Green Revolution. It forms a watershed between the old and new Pakistan. However, while the mid-1960s are in many ways an important juncture in our history, it is necessary to emphasize that change is a continuous process and events like the Green Revolution act only as an impetus to that change. While present-day Pakistan may have its roots in the Green Revolution much more has happened since the mid-1960s to make Pakistan what it is today. This chapter will examine the nature and consequences of the major transformation that took place in the mid-1960s.

Land reforms are an important mechanism for changing ownership and wealth patterns, economic and social relations of production, political relations, and a host of other factors. Land reforms usually imply a redistribution of land away from those who own large chunks of it to those who are often landless (see Box 3.1). There have been two sets of land reforms in Pakistan, both of which will be analysed in this chapter.

The purpose of studying any sector or society is to see how it has changed over time and how it continues to evolve. In Chapter 2, we discussed the process of change in agriculture from the times of the Mughals until independence. This chapter discusses some important events resulting in the transformation of the agricultural sector, while the next chapter examines the overall process of agrarian transition. The events and issues discussed in the present chapter have an important bearing on how agrarian transition has taken place.

3.1 THE GREEN REVOLUTION

The annual growth rate in agriculture between 1949 and 1958 was a mere 1.43 per cent, less than half of the annual growth rate in population. Agriculture was allowed to stagnate in the 1950s because the ruling élite believed at that time that it was essential to industrialize at all costs and at great speed. Government policies were heavily biased against agriculture, and it was only towards the end of the 1950s—when it became clear that growth in agriculture was necessary for the survival of the country—that the importance of the agricultural sector was recognized.

Box 3.1

Land Reforms: Need and Constraints

Viqar Ahmed and Rashid Amjad examine the principle behind land reforms. They argue as follows:

> In agrarian societies, land is the primary productive asset and the tangible expression of economic and political power. Therefore, the struggle for control of land and its fruits is a constant one. Throughout history, patterns of land ownership and tenure have played an important, and at times decisive, role in shaping the political and social system. It has, in most cases, also helped to determine the possibility and pace of economic change. It was thus inevitable as economic development became a major goal in these societies, and the principal concern of governments, that large concentrations of land ownership and the feudalistic pattern of social relationships came to be regarded as prime obstacles to sustained growth and development. Demands for radical changes in the land-tenure systems became more and more persistent both on grounds of social justice as well as a pre-requisite for economic development. . . .
>
> . . . A decision to undertake land reforms often meets with strong resistance from landowners who constitute a powerful élite in agricultural societies. It is, therefore, preceded by political controversies and national debate. Even after a land reforms proposal passes through the legislative process, its implementation is a complicated task due to the lack of organization at the village level, a dearth of proper data, a faulty maintenance of land records, and lengthy and complex legal procedures. These obstacles can, of course, be overcome by a strong political will and the active support of the rural masses for the programme.

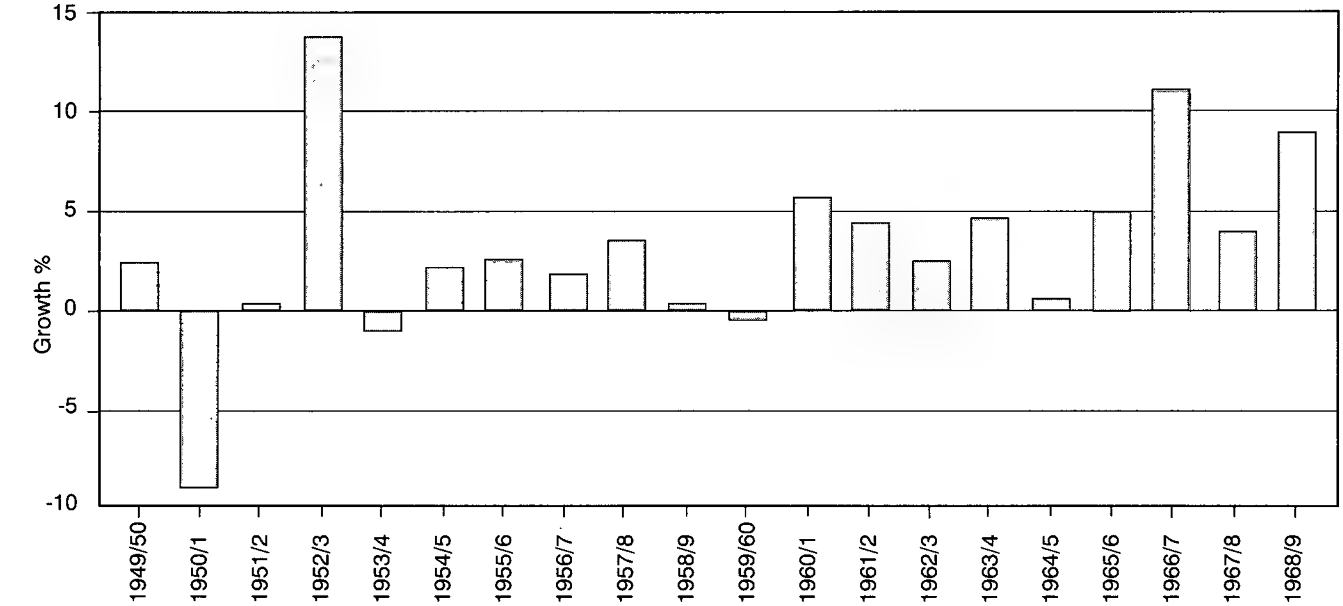

Figure 3.1
Growth Rates in Agriculture: 1949–69

Figure 3.1 shows the growth rates in agriculture in the 1950s and 1960s, and indicates a marked change between the two decades. Between 1959 and 1964, agriculture grew at an overall rate of 3.7 per cent, but this impressive rate was overshadowed by the even greater 6.3 per cent between 1965 and 1970. Between 1966/7 and 1967/8, the years when the Green Revolution was at its peak, agricultural output grew by 11.7 per cent, and it maintained a high growth rate of 9.6 per cent in 1968/9 to 1969/70. How were these rates achieved?

The phenomenal increase in growth took place in two phases. In the first, 1960 to 1964/5, the main cause of the growth was the increase in irrigation facilities, mainly tube wells. The second phase, between 1965/6 and 1969/70, showed impressive growth when the expanded irrigation facilities were supplemented by the technology package of high yielding variety (HYV) seeds, chemical fertilizers, and pesticides. Essentially, then, it was the complete package of water, seed, fertilizer, and pesticides that caused the large growth in agricultural output and production.

Without any doubt, *the most important ingredient in the technology package was water*, and water which was guaranteed and available as and when required. It was the key variable that established the spread of Green Revolution technology, since the new HYV seeds and the fertilizer package were critically dependent on the timely availability of a sufficient quantity of water. The increase in the availability of water, either by tube wells or through canals, was estimated to be responsible for half of the total increase in output.[1]

In the first phase, where irrigation was the critical component of agricultural production, privately owned tube wells were the main factor responsible for the increase in water availability. Between 1960/1 and 1964/5 about 25,000 tube wells were installed, each costing Rs. 5,000–12,000, and the farm area serviced by tube wells doubled.[2] In the second half of the 1960s, two HYV seeds, one for wheat, developed by the International Wheat and Maize Institute in Mexico, and the other for rice, developed by the International Rice Research Institute in the Philippines, were introduced in Pakistan. The Mexi-Pak wheat seed had been experimented upon in the early 1960s and, along with the IRRI rice seed, yielded higher output. These experimental results were soon reproduced across large areas of agricultural land. Since the HYV seeds required large sources of water, those areas that had better irrigation facilities and those that had installed tube wells were the first to adopt these seeds. Moreover, farmers who wanted to use the new seeds were also seen sinking tube wells and the number of tube wells in the country increased from 34,000 to 79,000 between 1964/5 and 1969/70. The area serviced by tube wells increased six-fold between 1959 and 1969. More than half of the irrigated area of the country (6 million acres) was cultivated with the improved seeds in 1969/70. Fertilizer consumption also saw a dramatic increase of 150 per cent between 1965/6 and 1970/1 and a rise of 235 per cent between 1965/6 and 1971/2.[3]

As Figure 3.1 shows, there were substantial increases in agricultural growth rates in each of the Green Revolution years. Moreover, the output of major crops between 1960 and 1970 increased substantially: wheat production by 91 per cent and rice by 141 per cent. Even other crops not directly related to the HYV seeds showed increases due to the extensive use of other non-seed factors in the package. So it seems that the Green Revolution, at least as far as production, growth, and output are concerned, was a resounding success. Nevertheless, we need to analyse the numerous issues and repercussions of this significant event in Pakistan's agricultural history.

3.1.1 The Issue of the Tube Wells

While the growth in tube wells from a few hundred in 1960 to 75,000 in 1968 and 156,000 in 1975 was a key factor in providing irrigation, and hence in permitting the adoption of the technology package, there are a number of issues around the apparently 'simple', and supposedly mere technical, issue of sinking tube wells.

The first issue concerns the location of tube wells: they were highly concentrated regionally, mainly in the rich, old, settled districts and the canal colony districts of the Punjab; indeed as many as 91 per cent of the 76,000 tube wells in 1968 were in that province. Outside Punjab there was very little tube well development. In the NWFP and Balochistan, the shortage of accessible supplies of ground water, due to the hard stony mountainous terrain, made the depth of drilling required for tube wells prohibitively expensive. In Sindh, the fact that ground water is saline meant that this water could not be used for agricultural purposes, and thus very few tube wells were sunk. Thus, it was not the entire province of the Punjab, but only a handful of districts in the Punjab that were able to sink tube wells and gain all the benefits of the Green Revolution. This, some observers believe, caused interregional disparities to grow (see below).[4]

Secondly, given their size and cost, tube wells were mainly installed by landowners with over 25 acres of land. Mahmood Hasan Khan writes that 'given the indivisible and large capacity of diesel and electric tube wells, even the middle peasants cannot afford their fixed and variable costs. Therefore, there has been a high concentration of ownership of tube wells.'[5] Seventy per cent of tube wells were put in by farmers owning over 25 acres, and only 4 per cent by farmers owning fewer than 13 acres.[6]

Thirdly, inducement to invest in tube wells was given to farmers through large public subsidies on fuel, installation costs, and maintenance. Moreover, the Agricultural Development Bank of Pakistan (ADBP) followed a fairly liberal credit policy and made numerous loans to farmers so that they could set up private tube wells.

Essentially, then, the apparently 'neutral' effect of increasing irrigation through tube wells seems to have had a number of important repercussions on interregional concerns, economic status, and the ability to borrow money. The extensive sinking of tube wells was far from scale neutral.

3.1.2 Tractorization

In Chapter 5, we discussed the critical issues in agriculture, an important issue examined is tractorization and mechanization. Tractors are now an important part of the agricultural and the rural scene, but their contribution during the Green Revolution had very important consequences. Akmal Hussain writes:

> tractor imports were systematically encouraged [after 1960] by the provision of cheap credit through institutions such as the ADBP. At the same time the overvalued exchange rate made tractors available in Pakistan at prices considerably below world market prices. Another factor stimulating tractorization was the greatly increased profitability of agricultural production, as the result of the availability of HYV of foodgrains, subsidized fertilizer, cheap electricity for tube well installation as well as improved provision of canal water following massive public surface water projects.[7]

Hence, due to the technology being used, tractors became more useful on the farm.

In 1959 there were 2,000 tractors in the country, which increased by over 8,000 per cent to 18,909 in 1968. Most of these tractors were of the larger size, with 84 per cent above 35 horse power. A World Bank Study of 1966 and the Giles Report in 1967 recommended the use of the larger tractors.[8] Once these tractors were imported the pattern was set, and large tractors still dominate today (see Chapter 5). Not surprisingly, most tractors were owned by those with more than 100 acres of land.

In a study in the early 1970s, Carl Gotsch reported that over 38 per cent of all tractors in the country were located in the Multan Division in Central Punjab, while 58 per cent were in the three divisions of Lahore, Multan, and Bahawalpur[9] There was also a very close link with tube well ownership, where almost 75 per cent of privately owned tractors were on farms that had sunk tube wells.[10]

Clearly, tractorization took place in those areas which had 'complementary inputs, [was] carried out by the larger and more resourceful farmers and [was] associated with a proximity to urban markets and services'[11]—similar to those found with tube wells.

3.1.3 Regional and Income Disparities

If tube wells were the single most critical factor that was responsible for the Green Revolution, and if the sinking of tube wells had a close correlation with tractorization, which in itself would have helped production further, a pattern emerges. Moreover, if we discovered another close correlation, that between large farms, in specific regions, and tractors and tube wells, the impact on regional and income inequality would be self-evident. Let us examine the evidence.

Hamza Alavi writes that 'because private tube well development is closely relative to concentration of land in large farms, the "Green Revolution" has tended not only to intensify already large disparities in income and wealth of the different strata of rural population but, by the same token, it has also widened disparities between different regions'.[12] He adds that the incomes of the rural élite increased, while the incomes of small farmers in the districts where the Green Revolution was most successful, and in other poorer regions, 'have failed to improve or have not improved in the same measure'.[13] These views are shared by most researchers on the Green Revolution. Moazam Mahmood argues that the inputs, especially the installation of tube wells and access to credit, were inaccessible to poorer farmers and, hence, that the latter did not share in the fruits of the Green Revolution, causing increases in relative poverty.[14]

Mahmood Hasan Khan says that, since the use of fertilizers and new seeds was premised on the availability of adequate water supply, the lack of water caused 'serious interregional

and intra-farm disparities'.[15] The NWFP and the south-eastern parts of Sindh had inadequate access to water and the HYV technology. The difference between the poor and rich peasants also increased due to the unequal access to inputs.

Carl Gotsch has argued that one should talk not of the increase in agricultural growth in Pakistan, but rather of growth in a relatively few districts. These districts in the Punjab–Lyalpur (Faisalabad), Montgomery (Sahiwal), and Multan—grew at 8.9 per cent per annum between 1959/60 and 1964/5, twice the 'national' rate. Thus, as Shahid Javed Burki has argued, it was the farmers who owned between 50 and 100 acres, almost all of them in the Punjab, who produced 'Pakistan's' Green Revolution.[16]

3.1.4 Élite Farmer Strategy and Capitalist Development

Some observers have argued that the Green Revolution was 'an élite farmer strategy because . . . it rest[ed] on the economic power of large landholders who [were] its principal beneficiaries'.[17] For them, this rural élite constitutes less than 5 per cent of the rural population of Pakistan and was the only real beneficiary of the Green Revolution. Akmal Hussain believes:

> The new technology made it possible to accelerate agricultural growth substantially through an 'élite-farmer strategy' which concentrated the new inputs on large farms. Now the crucial determinant in yield differences became not the labour input per acre in which small farms had been at an advantage, but the application of the seed–water–fertilizer package over which the large farmers with their greater financial power had superior access. Thus the technocrats felt that the Green Revolution had made it possible to accelerate agricultural growth without having to bring about any real change in the rural power structure.[18]

Despite (or possibly because of) these anomalies in the benefits of the Green Revolution, one outcome upon which all observers are agreed is that the Green Revolution resulted in the development and entrenchment of capitalist farming in the regions where the technology was adopted. However, there are some differences of opinion over who were the leaders of this change in the mode of production and in farming techniques.

Shahid Javed Burki and others believe that the rapid agricultural growth was led by a new breed of dynamic middle-class farmers who were capitalist to start with. These farmers had been created by the shift in political power under Ayub Khan, who, Burki argues, through his Basic Democracies scheme took away political power from the traditional big landlords and gave it to the middle-class landowners. It was these middle-class farmers, owning between 50 and 100 acres of land in the Punjab, who 'produced' the revolution in Pakistani agriculture. Ayub Khan's creation, the rural middle class, was considered a 'new powerful and independent factor in the political system', which had been 'released from the political and rural control of the landed aristocracy' and emerged as the 'traditional profit maximizer'.[19]

This view has not been shared by the likes of Hamza Alavi and Akmal Hussain, who believe that it was the large landlord and not the middle class which was at the vanguard of this revolution.[20] They believe that farmers who had land over 100 acres were dominant in the adoption of the new technology and in reaping the fruits of the Green Revolution. Alavi feels that the new mechanized methods did not bring into existence a new class of capitalist farmers, but that it was 'mainly the big landowner who . . . made the greatest progress in the direction of farm mechanization'.[21] Nevertheless, they all agree that the impact was one of deepening capitalist relations.

There was increased leasing-in of land as large farmers were now willing to take back the land previously leased to sharecroppers. Due to the large scale of tube wells and tractors, more and more land was resumed for production under capitalist means. Not only that: owners of this technology began to lease-in their neighbours' land as well. These farmers began to evict tenants or send them to more marginal portions of the land, and began to hire wage labour instead. Self-cultivation was on the increase in areas where this technology was used. There was greater income in the hands of landowners, who began to purchase manufactured goods. As demand and consumption expanded, markets began to emerge around small towns. A number of attributes particular to capitalism (see Chapter 2) began to dominate in the agricultural sector, probably ending once and for all the debate on whether agriculture in Pakistan was feudal or capitalist. Capitalism had entrenched itself forcefully and permanently.

3.1.5 Social and Political Effects

Although the economic effects of the Green Revolution were easily observable, with growing overall output and increasing incomes for some, the social and political effects took a little longer to emerge. Amongst the economic factors that had social and political impacts were: the displacement of labour, both at the low end of the spectrum in the form of sharecroppers, and at the higher end, where those with land either sold it or rented it out to neighbours; increased rural–urban migration; an increase in consumerism; the emergence of small towns near agricultural areas that were using capitalist techniques, and hence required new and different services; and the awareness of disparities between farmers and regions.

There was also a change of attitude towards education, especially amongst the big farmers. Writing at that time, Hamza Alavi argued that 'the revolution in mechanical technology and chemical technology which is now employed in agriculture is making new demands upon the capabilities of the farmers. They are becoming increasingly aware of the values of education in terms of their own situation, namely for better farming and coping with new technologies.'[22] However, the emphasis upon the social sectors was not particularly impressive in the 1960s and education was not considered important by the Ayub Khan regime (see Chapter 19).

Before the Green Revolution there was a lot of talk about the small farmer and how efficient he used to be. However, as the new technology spread, the size–efficiency relationship was reversed: rich peasants and landlords made most and best use of the lumpy investments in a technology that, as we have seen, was not scale neutral and was biased in favour of the large landlord. Mahmood Hasan Khan argues that 'the structure of technology and the direction of credit flows themselves reflect the influence of large landowners and capitalist farmers on public policy'.[23] Moreover, it is important to emphasize the fact that, since Punjab and Sindh are the backbone of Pakistan's agricultural economy, with more than 75 per cent of the country's population, and 80 per cent of its cultivated and cropped area, the impact of the Green Revolution was restricted to these provinces. Moreover, because of the water and technology packages identified above, the NWFP and Balochistan missed out on the Green Revolution of the 1960s. (However, Chapter 5 reveals some interesting recent trends regarding increases in output and production in these two provinces.)

Nirmal Sanderatne has been particularly observant about the political consequences of the Green Revolution and relates them to the rise and subsequent victory of the Pakistan People's Party in 1972. He argues that 'the overwhelming electoral victory of the PPP amply justified its strategy [of making promises to the peasantry on agrarian reform] and demonstrated the validity of the hypothesis advanced earlier that the nature of agricultural development in the past, while successful in terms of increasing aggregate production, had intensified existing economic disparities and dissatisfactions. In turn these had radicalized Pakistan's politics.'[24] The PPP won conclusively in the heartland of the Green Revolution and some observers found a 'high correlation between the voting for the PPP and the area under Mexi-Pak varieties of wheat. The PPP won in all but one of the constituencies in which more than 56 per cent of the wheat area was under the new varieties.'[25]

The emergence of the Pakistan People's Party on the Pakistani political scene and its subsequent victory in the 1970 general election were the result of the policies of Ayub Khan's decade. The election results from the rural areas were a direct consequence of the Green Revolution, and even urban areas were not spared the outcome of agrarian change as migrants from rural areas began to play some role in industrial and urban areas as well. With hindsight, one can say that the 1970 election, with the victory of the Awami League in East Pakistan and the People's Party in West Pakistan, may have been the only election held in Pakistan where economic conditions so directly influenced political outcomes. Perhaps it was the degree of turmoil and disparity that emerged after the Green Revolution of the 1960s, as it usually does after any revolution, which made such politics possible. Since then, development in Pakistan has probably been less disharmonious, and hence change has been more gradual and less disruptive. The Green Revolution was the first big shock that disrupted gradual growth, especially in agriculture, but also more generally across Pakistan. There is little doubt that it radically transformed the economic, political, and social direction of the country, establishing deeper, more entrenched, capitalist relations of production than those that had existed earlier in agriculture.

Development and growth, especially of capitalist relations, is a disharmonious process, often creating but also destroying, and having negative consequences for some sections of the population. However, one needs to examine the overall nature of development. Hamza Alavi, for example, argues that 'the present course of the "Green Revolution" . . . has brought about a deterioration in the conditions of life of a majority of the population and further progress of farm mechanization is creating a situation when a very large number of the rural population is faced with the prospect of having no viable means of livelihood'.[26] At a micro level this scenario did happen, but this analysis ignores the impact of the greater dynamic of change (even progress) that resulted in the use of this technology. Moreover, Hamza Alavi's lament ignores his own analysis where he recognizes that the Green Revolution was geared to the needs of large landowners, and was even made by the bureaucracy in tandem with their class allies, and hence that the outcome was inevitable. Any other outcome, given the nature of the state, class alliances and the focus on large landowners, would have been unlikely.

Akmal Hussain, too, falls into such a trap. He realizes that the new technology did accelerate growth in agriculture substantially through an élite farmer strategy, and that the 'growth of capitalist farming accelerated considerably in the late '60s as large landowners began to resume rented out land to operate their own farms with hired labour and capital investment'.[27] But, for Akmal Hussain, 'it was this process of the development of capitalist farming which has generated new and potentially explosive contradictions in Pakistan's rural society'.[28] Again, any other outcome would have been unlikely. Given the existing contradictions, class alliances, and the role of the state, the result was a natural consequence of the policies followed.

3.2 Land Reforms[29]

Pakistan has had a long and varied history of land reform. Most attempts have been just that: attempts without any serious purpose. Table 3.1 gives details of many such attempts, most of which failed. From 1945 onwards there was talk of reform in the nature of tenancy and in the structure of landholding, but little came of it. The reasons for this are fairly clear and not surprising. In the Central Council of the Muslim League in 1947 there was a large representation from the (very) large landlords of the provinces of the Punjab and Sindh—these comprised 50 per cent of councilmen from Punjab and 60 per cent from Sindh. Furthermore, with quite exploitative conditions in rural areas in the 1940s, involving complete domination and control by landlords, it was a little unrealistic to assume that they themselves would be willing to put a dent in their source of power (see Chapter 2, Table 2.2 for landholding patterns in 1947). Landlords were the most significant class in the Muslim League, comprising 163 of the 503 Muslim League parliamentary members in 1942. From the time of independence, all Chief Ministers of the Punjab,

Table 3.1
Key Dates and Features of Land and Tenancy Reforms in Pakistan

Year	Reform	Key features and recommendations
1945	Tenancy Laws Committee, Sindh	Occupancy rights should be granted to *haris* who had personally cultivated at least 4 acres of land annually for the same *zamindar* for 8 years.
1947	*Hari* Committee, Sindh	Defended the landlords; famous Note of Dissent from one member who argued for radical changes in the land tenure system.
1949	Muslim League Agrarian Committee Report	Abolition of *jagirs*; security of tenure for all tenants; share rents should replace rents-in-kind; ceiling on landholdings of 150 acres irrigated and 450 acres for unirrigated; land distribution to tenants and compensation to landlords (report shelved).
1950	Punjab Tenancy Act	No charge by landlords from tenants other than 50 per cent crop share.
1950	Sindh Tenancy Act	Permanent rights of tenancy to long-term tenants; eviction rights to landlords under certain conditions.
1950	Punjab Protection and Restoration of Tenancy Rights Act	Eviction of tenants allowed only under specified conditions.
1952	Punjab Tenancy (Amendment) Act	Abolition of occupancy tenancy; transfer of ownership rights to occupancy tenants; share of landlord reduced from 50 per cent to 40 per cent.
1955	Executive Order	Abolition of *jagirs* and other revenue-free grants; like other *zamindars*, now *jagirdars* required to pay land revenue. Landlordism remained intact, for no limit to ownership as long as all legal dues paid to the government.
1955	Challenge to the Executive Order	Challenge upheld by Sindh High Court.
1959	Land and Tenancy Reforms – Martial Law Regulations 64, 64A and 64B	Ceiling on landholdings: 500 acres irrigated, 1,000 acres unirrigated additional land allowed to bring landholding to equivalent 36,000 PIUs; resumed land to be sold first to tenants and then to small farmers; abolition of *jagirs*; occupancy tenants made owners; all tenants, *haris* and tenants-at-will given legal protection; rents to be paid in kind and all charges other than crop share abolished.
1972	Land and Tenancy Reforms – Martial Law Regulation 115 and amendments	Ceilings on landholdings: 150 acres irrigated, 300 acres unirrigated or equivalent of 12,000 PIUs + 2,000 PIUs for tractor and tube well owners; no compensation to landowners, land redistributed without charge to landless tenants cultivating resumed land; untenanted resumed land redistributed without charge to small owners/tenants with holdings below subsistence; share system remains unchanged; land revenue, water rates, and seed costs borne by landlords and cost of fertilizers and pesticides to be shared equally; tenant eviction decided by revenue courts if tenant failed to pay rent, failed to cultivate land, sublet tenancy, or rendered land unfit for cultivation.
1977	Land Reforms Act	Landholdings: 100 acres irrigated, 200 acres unirrigated or 8,000 PIUs equivalent; compensation to landowners on resumed land at Rs. 30 per PIU; redistribution as in 1972. This Act was completely ignored by the military government after July 1977.

Sources: For 1945 and 1947, Khan, Mahmood Hasan, *Underdevelopment and Agrarian Structure in Pakistan* (Boulder, Colorado: Westview Press, 1981). For the rest of the chart, Nabi, Ijaz et al. *The Agrarian Economy of Pakistan: Issues and Policies* (Karachi: Oxford University Press, 1986), 60.

Sindh and NWFP were big landlords. If the power of landlords prior to 1947 was substantial, the creation of Pakistan increased their power even further. Many of them were able to acquire large tracts of land from the fleeing Hindus, while others bought land from moneylenders at cheap rates in the mayhem that ensued. Others, because of their influence in the area, were able to get the revenue officials to sign over land to them, in excess of their due share. Hence, there was little scope for serious reform in agriculture at the time of partition.

The 1949 Muslim League Agrarian Committee proposed some measures that could have addressed the issues related to land, its distribution, and its use. The report was shelved soon after being finalized. The hold of large landlords on political power can be demonstrated by the provincial elections held in the Punjab in 1951, where they won 80 per cent of the seats, while in the provincial election in Sindh in 1953 large landowners won 90 per cent of seats.[30] Mahmood Hasan Khan writes that in the 1950s,

> the landed élite continued to exercise their traditional power without hindrance or opposition in the countryside. In this they were supported by the civilian bureaucracy, as was evidenced by the failure of tenancy reform measures legislated in the Punjab and Sindh. More significantly, as new irrigation and settlement schemes in the Punjab and Sindh were undertaken in the mid-fifties, civil and military bureaucracies were clearly given preferential treatment for irrigated land.[31]

Thus, the nexus of political power between the civil and military bureaucracy and the landlords ensured that the status quo would not be disturbed. As Mahmood Hasan Khan argues,

> it seems fair to conclude that the approach to land reforms depended on the class character of the power élite. As long as landlords occupied a central place in the balance of power, and their position remained without threat in rural areas, no land reforms could have been implemented. The political system created new pressures which the landed elite could not successfully resist.[32]

The first land reforms in Pakistan were undertaken by a military regime that was perceived to be modern and progressive. The Ayub Khan regime did not owe its allegiance to, and nor was it dependent on, the influence of the agrarian landed class, and thus it was in a position to undertake some sort of reform. However, although the reforms set out to break the power of the large landholding class and to make tenancy more humane, their impact was severely limited. What they did was to distribute power away from some landlords and include the civil and military élite in their strategy. While Shahid Javed Burki has implied that these land reforms were the precursor to the dynamic middle-class farmer of the Green Revolution, who emerged as the main beneficiary of the Basic Democracies system, most other scholars disagree (see section 3.1). Hamza Alavi[33] and Mahmood Hasan Khan[34] argue that the Basic Democracies system maintained the hold of the landlord on the political system of Pakistan. Nirmal Sanderatne also argues that the 1959 land reforms were an eyewash, where the power of the ruling coalition of landowners, bureaucrats, and industrialists was left well intact.

3.2.1 The 1959 Land Reforms

Table 3.1 presents the salient features of the Ayub Khan land reforms of 1959. The reforms were meant to put ceilings on landholdings and were supposed to be an attempt to change tenancy regulations.

As we showed in the previous chapter (Table 2.2), before the land reforms of 1959 the distribution of land ownership was highly skewed in favour of a few large landlords who controlled large tracts of land. Approximately 6,000 owners owned more than the ceiling of 500 acres permitted in 1959. They constituted 0.1 per cent of the owners, but owned 7.5 million acres or 15.4 per cent of the total land. Table 3.2 shows that in all there were only 5,064 declarants, of which only 15 per cent or 763 were affected by the ceilings on individual holdings. The area of land owned by the affected declarants was 5.5 million acres, of which only 1.9 million (35 per cent) was resumed. The main portion of their land was retained by the landlords due to numerous provisions made in the law, such as for the transfer of land to dependants and other members of their families, and exemptions for numerous categories.

Not only was a small amount of land handed over, but of that land, more than half (57 per cent) was uncultivated. Of this, parts were hills or deserts—terrain which was not fit for cultivation—and some consisted of land that needed to be developed in order to be made fit for cultivation. Since a central feature of the 1959 land reforms was that owners were to be paid compensation for their lands, many benefited by handing over poor-quality lands to the government. As Mahmood Hasan Khan argues, 'given the high proportion of uncultivated land surrendered in certain districts, it is clear that landowners received payments for land which was producing nothing and most of it would require improvement after it was sold to new owners'.[35] Compensation was paid at rates of Rs. 1–5 per Produce Index Unit (PIU) (see Appendix 3.1) and in 'fifty half-yearly equated instalments in transferable but non-negotiable bonds bearing 4 per cent per annum interest on unpaid balance'.[36]

Another feature of the 1959 reforms was that resumed land was to be sold to landless tenants. By 1967, only 50 per cent of the resumed land had been sold, with only 20 per cent of the resumed land sold to landless tenants. The remainder was auctioned to rich farmers and civil and military officials. According to one estimate, only 67,000 landless tenants and small owners could have bought the resumed land sold to them.[37] The land was sold at the rate of Rs. 8 per PIU, payable in fifty half-yearly instalments with a 4 per cent annual interest rate on the outstanding balance.

Due to the abolition of *jagirs* in 1959, 0.9 million acres were declared as *jagir* lands, of which one-third were resumed by the government. The purpose of the abolition of revenue-free

Table 3.2
Number of Declarants and Resumed Area under the Land Reforms Regulation of 1959

Province/division	Number of declarants			Area of affected declarants (acres)	Area retained (acres)	Area gifted (acres)	Area resumed (acres)
	All	Unaffected	Affected				
Punjab	2,152	1,844	308	3,637,648	2,306,657	288,715	1,044,276
Multan	838	720	118	2,838,325	1,934,664	225,411	672,250
Sargodha	606	504	102	412,213	165,033	28,701	218,479
Rawalpindi	249	227	22	148,827	53,019	9,947	85,861

lands (*jagirs*) was to transform them into revenue-paying tracts. In 1960, the government realized about Rs. 3 million from this provision.[38]

The land reforms allowed farmers to have their lands valued in PIUs, up to a maximum of 36,000 PIUs. The PIU is 'estimated as a measure of the gross value per acre of land by type of soil and was, therefore, seen as a measure of land productivity'.[39] However, the measurement of the PIUs was based on pre-partition revenue settlements, which substantially under-reported the true value of the land. Thus, even if we take the 1959 PIU as the correct measure of productivity, the 36,000 limit was far greater than the allotted ceiling of 500 acres of irrigated land. For example, it has been calculated that in the irrigated areas of Sindh the PIU per acre would have been about 20. This meant that each individual could own at least 1,800 acres according to the law which limited holding to 500 acres.[40] (For a note on PIUs, see Appendix 3.1.).

Mahmood Hasan Khan sums up his evaluation of the reforms as follows:

> It is now evident that the land reforms of 1959 could not have reduced the feudal power of landlords. For one thing, the generous ceiling on individual holdings, with transfers and exemptions, defined as they were in PIUs, left the concentration of land in the hands of landlords. If we accept that the average retained area by the so called affected landlords was the *de facto* ceiling, then its limit was 7,489 acres in the Punjab, 1,659 acres in Sindh, and the average for the country was 4,033 acres. Further, almost three-quarters of resumed land, at least in the Punjab, was uncultivated and untenanted. This meant that the amount of land available for redistribution (and remember by sale) was even more limited. Further, landlord–tenant relations were left unchanged, to be governed by the tenancy acts passed in the early fifties and to be supervised by the revenue service.[41]

3.2.2 The Bhutto Reforms of 1972

The 1972 reforms were different from those of 1959 in many respects. Firstly, the philosophy behind the Bhutto reforms was based on the social democratic leanings of the Pakistan People's Party. In March 1972, Bhutto gave a speech in which he said that his land reforms would 'effectively break up the iniquitous concentrations of landed wealth, reduce income disparities, increase production, reduce unemployment, streamline the administration of land revenue and agricultural taxation, and truly lay down the foundations of a relationship of honour and mutual benefit between the landowner and tenant'.[42] The Manifesto of the People's Party laid the premise for this action by stating that 'the break up of the large estates to destroy the feudal landowners is a national necessity that will have to be carried through by practical measures'.[43]

The main features of the reforms are shown in Table 3.1. A few features distinguished the 1972 reforms from the earlier ones. While ceilings had been further lowered in 1972 and a number of exemptions removed, possibly the most prominent feature of the reforms was that, unlike in 1959, land resumed from landowners would not receive any compensation, and this land was to be distributed free to landless tenants. In addition, all those peasants who had acquired land under the 1959 reforms and had dues outstanding, had their dues written off and were not required to make any further payments.

Of the land declared to be above the ceiling by the landowners, after they had made generous use of the possibilities for getting around the imposition, only 42 per cent was resumed in the Punjab, while the figure in the

Sindh was 59 per cent. In all, 0.6 million acres were resumed, far less than the 1959 figure and constituting only 0.001 per cent of the total farm area in the country.[44]

The problem of the evaluation of the Produce Index Units arose once again. The ceiling of the land was defined both in area and PIUs, and the landowner could retain the larger. However, Mahmood Hasan Khan writes that

> the most serious problem of defining the ceiling in PIUs was that their values had remained unchanged, while almost everything affecting their value had changed drastically in most areas of the Indus Basin. The produce value of an area of land was being grossly underestimated in the Indus Basin, thanks to changes in prices, cropping intensities and patterns, irrigation, etc.[45]

The result was that with 12,000 PIUs one could get away with 400 acres in the Punjab and 480 in Sindh. Moreover, with other exemptions for tube wells and tractors, a family could have retained up to 932 irrigated acres in the Punjab and 1,120 in Sindh![46] (See also Appendix 3.1.)

Although a lot of propaganda was issued about the success of the 1972 reforms, as the resumed land was far less than in 1959, only 50,548 persons benefited from the redistribution of 308,390 acres during 1972–8. Only 1 per cent of the landless tenants and small owners benefited by these measures. Table 3.3 shows that of the land resumed in 1959, 6 per cent still needed to be distributed even after 38 years, and 39 per cent of the area resumed under the 1972 reforms was still held by the government despite the presence of a large number of landless cultivators.

Table 3.3
Progress of Implementation of Land Reforms up to June 1994 (in Hectares)

3.3 Summary and Further Reading

3.3.1 Summary

It seems that the technological package that resulted in the Green Revolution in the mid-1960s was focused on the more well-to-do farmers in the more prosperous regions. This is factually correct, but fails to highlight the externalities and other repercussions of this important process. The demonstration effect of using the technological package was substantial, but more importantly, a supposedly simple technological intervention let loose many economic and social processes, resulting in migration, labour displacement, the formation of small towns, skilled labour power, and a host of other political outcomes. Our evaluation of the 1959 and 1972 land reforms, however, shows that they failed to make substantial changes in the landowning structure of the country. Shahid Javed Burki argues that the 1959 reforms created the enterprising middle farmers—a view that is contested by Hamza Alavi, who argues that landlordism became more established and entrenched. Of course, given the hold of the landowning class on government and its institutions, this is not very surprising. The huge loopholes that existed in the 1959 reforms to make intra-family and intra-household transfers meant that the landowning structure remained largely unaltered. Hence, effective land reform in Pakistan will continue to be a problem. Nevertheless, we show in the next two chapters that, even if formal land reforms are not undertaken in Pakistan, other social and economic processes can achieve similar results. Smaller landholdings and more capitalist lines of agricultural production have developed despite a lack of adequate land reform. Demographic and economic changes over the last twenty years have resulted in evolving a different pattern of ownership and production than in the past. While these processes are not a substitute for land reform, it is important to realize their contribution towards achieving somewhat similar ends. However, in Chapter 5 we do make the argument for land reforms.

3.3.2 Further Reading

Amongst the books on the two topics covered in this chapter, the following are recommended:

(eds.), *Rural Development in Bangladesh and Pakistan* (Honolulu: University Press of Hawaii, 1976); Ali, Karamat (ed.), *Pakistan: The Political Economy of Rural Development* (Lahore: Vanguard, 1986); Hussain, Akmal, *Strategic Issues in Pakistan's Economic Policy* (Lahore: Progressive Publishers, 1988); Ahmed, Viqar and Rashid Amjad, *The Management of Pakistan's Economy, 1947–82* (Karachi: Oxford University Press, 1984); and Ijaz Nabi et al. *The Agrarian Economy of Pakistan: Issues and Policies* (Karachi: Oxford University Press, 1986).

Appendix 3.1

The measurement of Produce Index Units and a case for their revision

M. Shafi Niaz documents the history of Produce Index Units and how they are measured. He makes the strong case for their reappraisal as follows:

Before the partition of the Indian sub-continent, there was an obligation on the part of the governments to periodically carry out revenue assessment of land holdings. This period generally varied between 15 to 20 years. The last assessment that had taken place before partition in the undivided Punjab was in the mid-thirties. The main idea of such assessments was to revise the land revenue in accordance with the changed values of the land. For such valuation, each administrative district was divided into assessment circles. In each such circle, land was categorized whether it was *chahi* (well-irrigated), *chahinehri* (well-cum-canal irrigated), flood irrigated, or *barani* (rain-fed) and so on.

According to the information contained in the Report of the Land Reforms Commission for West Pakistan, 1958–59, the produce value per acre of each class of soil in the various assessment circles was worked out on the basis of average 'matured-acre-yields' and prices adopted by the Settlement Officer at the time of the last settlement of each district. The total produce value thus obtained for each class of soil in each assessment circle was, therefore, divided by the average matured area in order to arrive at the average productive value for one matured acre of land.

The Land Reforms Commission Report further states that for working out a reasonable formula, it was felt by both the governments that since the settlement operations were carried out at different times in different districts, 'suitable' multiples had to be applied to the produce values, as described above, for bringing them to uniform levels in both the Punjab and other agreed areas of India.

For this purpose, a basic period of three years (excluding unusually bad years) was selected for all the districts in both the Punjabs, and average value of the output per acre of sown area in the year in which actual prices corresponded, as far as possible, with the prices assumed by the Settlement Officer were ascertained. This period was called the 'settlement period'. Then the average value of the output per sown acre in this base period was calculated and figures of produce given by the Settlement Officers were multiplied by the ratio which the average value of the produce per acre of the base period, bore to that of the settlement period. This methodology can be explained, by an example of Tehsil Lahore for the assessment circle 'Bet Chahi' having '*chahi*' (irrigated land) as the class of soil. In this case, the total area involved was 10,117 acres having a gross produce value of Rs. 409,104. The produce value for the 'matured' area comes to 40 (gross produce value divided by the total matured area). This is multiplied by 2.0, the worked out ratio for the Lahore district. The resultant figure of 80 is the produce index (or produce index unit) for the assessment circle referred to above.

The agreed formula was adopted by both the governments as a pressing need of the time with a view to settling the refugees without loss of time. It is no denying the fact that the objective in accepting the formula was to try to allot land holdings, as best as possible, of equal value to the immigrants so that they could quickly start to earn their livelihood for the upkeep of their uprooted families.

This formula served the purpose of the day despite the inherent weakness it had. According to the available information, the assessment of land was not carried out on an extensive and comprehensive scale in provinces other than the Punjab. So the exercise in the three provinces had to be carried out in haste so that the rehabilitation process was not held up and to let it go ahead without any undue hindrance. A close reading of the methodology as quoted above, would raise a number of questions about the validity of the produce index units and it would not serve a useful purpose to go into the details here. It is, however, generally believed that in the NWFP and the Punjab, the PIUs were worked out, inter alia, on the basis of 'total' production of land while in Sindh these were worked out on the basis of the shares of the produce which the landlord got and these varied generally between 50–60 per cent of the total produce. A disparity thereby seemed to have developed at the time of the formulation of the PIUs which has its implications at the implementation stage, whenever these were used as a basis for policy decision. The result has been that the farmers in the NWFP and the Punjab were bound to bear the inequalities in the allotment of land at the time of independence and in the future use of PIUs, particularly when a ceiling on individual ownership of land was determined as a result of land reforms in 1958–9, 1972 and 1977. The situation in Balochistan was not much different. The province-wise details are given below.

For the Punjab, as mentioned above, the PIUs were worked out more systematically. The assessment circles, totalling 265, were made the basis, and each assessment circle was divided according to the status of the soil, irrigation facilities and other identical factors. In all, some 1363 areas were categorized. Of these areas, about 600 (or 44 per cent) were those where the PIUs were above 40. If agricultural tax is to be levied on lands having 40 PIUs or more, 40 per cent of the areas would be liable to land tax.

In Sindh, PIUs were worked out by each Taluka (tehsil) and the land in each Taluka (74 in all at that time) was, in general, categorized on the basis of the type of irrigation (flow, lift, combined) available for raising crops. The total number of such categorized areas (as one would call them) amounted to 480. It is very interesting to note that it was only in one out of the 480 areas where the PIUs were 42 and in all other areas these were much less than 40. So, if agricultural tax is to be levied on land having 40 PIUs or more, only one of 480 areas would be liable to tax; other areas should get exemption.

The basis for working out PIUs in the NWFP province is similar to that of the Punjab. The total assessment circles were about 100. These circles were divided into about 480 areas depending mainly on the mode of irrigation facilities,

type of crop grown, and so on. Of these 480 areas, about 200 or 40 per cent have PIUs more than 40. If agricultural tax is levied on land having 40 PIUs or more, about 40 per cent of the areas would be liable to land tax. The PIUs in Balochistan province were prepared only for 4 tehsils divided into 16 assessment circles in which PIUs for 44 types of land were recorded. Only 17 out of these have PIUs above 40 which could be liable to agricultural tax if it is levied on areas having 40 PIUs or more.

The above facts and figures bring out not only the disparity that exists in the methodology used in working out PIUs in the various provinces but also show that these are by now far out-dated and thus unrealistic and unequitable for use either in determining the ceiling on ownership or for using as the basis for land tax. If PIUs have to be used in future for any useful purpose, these must be redetermined. And for this purpose, land assessment may have to be carried out as a prerequisite. Time and effort for the exercise will be well spent and will bring dividends in the form of, amongst other things, upward revision of the land revenue as the value of land must have gone up manifold since last assessment operations were carried many decades ago. This would undoubtedly also help the provincial governments to improve their resource base and all the provinces would get an equitable and uniform basis for future use of PIUs.

4 The Nature and Direction of Agrarian Change

We have established the premise in the previous chapter that capitalism in agriculture began to establish itself early in the twentieth century following a number of interventions made by the British colonialists in the region that now constitutes Pakistan. The feudal or pre-capitalist structures, while prevalent, were slowly being dismantled and dissolved. Pre-capitalist forms have shown a resilience in many parts of the world despite the development of capitalism. Notably, peasant forms of farming which should have been dissolved under capitalism, where two classes of owners are supposed to emerge and coexist, have shown persistence against all odds. Nevertheless, in Pakistan it would be fair to say that once capitalism took root in agriculture, it began to eliminate pre-capitalist and feudal modes. Once established, capitalism became the dominant mode of production in agriculture and throughout the entire economy, although pre-capitalist forms continue to be resilient and persist.

These, in many ways, are the most important themes in relation to agriculture: to examine how and why Pakistan's agricultural sector has been developing in a particular direction, and to assess what possible direction it will take. Agrarian transition or change, by definition, implies movement from one place or type to another. How have economic and social relationships changed over time in agriculture? Have there been significant changes in landholding and landownership patterns? What has been the trend of sharecropping—is it on the rise, or falling? These are some of the questions that this chapter will discuss. We will also see the different patterns in the four provinces, and especially in the Punjab and Sindh, which form the backbone of Pakistan's economy and politics. Our main focus in this chapter will be on the change in agrarian structure and agrarian relations from the 1960s to the present.

The chapter contains numerous tables, which are extensive and cumbersome. However, these numbers are essential, for we can base our analysis only on the observation and interpretation of data. While making the tables available for those interested in examining the precise figures; we attempt to describe and summarize their salient features before discussing and interpreting them.

Things are further complicated by the problem of how one should classify and categorize the pattern of landownership and other phenomena that we want to observe. However, we may not always be able to choose the categorization that we want, as data limitations—severe at times—may force us to accept and use only what is already available. For example, we may prefer to use the concept of *classes* to explain agricultural processes and change, and to show which class constitutes what share in the agricultural sector as landowners and as producers of labour power. The use of class helps us to observe important trends in the types of change taking place. For example, how is the process of capitalism being consolidated over time? Can one identify feudal remnants, and what has been their contribution over time? However, while we would like to use the concept of class to study agrarian transition, data of this nature are not easily obtained. Despite its numerous shortcomings we must make use of what is published (see Appendix-4.1).

What is published by the Government of Pakistan regarding agricultural landholding patterns is usually based on the nature of tenure: 'owners', 'owner-cum-tenants', and 'tenants'. Moreover, size usually plays an important role in the classification, where either small/medium/large is used, or some distribution by the size of holding, i.e. acreage categories, is made available. However, Mahmood Hasan Khan correctly points out that 'the concept of farm size by its very nature is quite arbitrary and therefore not universal. Secondly, division of farms into small and large does not reveal anything about who controls and cultivates these farms.'[1] Although there are problems with this sort of classification, we use these criteria in the tables that follow—not only because of the absence of alternative data, but also because they still offer useful insights into the nature and direction of change in Pakistani agriculture.

4.1 Explaining the Numbers

In this section we attempt to highlight the main features of the tables provided. The explanations given here are important in following the arguments in a later section. Those who can grasp the numbers and their meaning easily are advised to read the text and then explore further details in the tables.

There have been six agricultural censuses in Pakistan, in 1960, 1972, 1980, 1990, 2000, and 2010. Our method of presentation and explanation takes the following pattern. For each of the census years, we will highlight, separately, the main features in the relevant table. We will try to standardize the format as far as possible so that the trends can be followed, although, this is easier said than done. After presenting a summary of each census, we present some tables which compare the trends over time, describing the salient features. In the next section, we try to interpret these tables and examine their implications.

The 1972 Census (Table 4.3)

1. By 1972, owner farms had replaced tenant farms as the largest category in terms of both number (42 per cent) and acreage (40 per cent) in Pakistan (Block A, columns III and IV). In fact, the shift in both tenant farms and owner farms in the period 1960 to 1972 is quite significant (compare Block A, columns VII and VIII in Tables 4.2 and 4.3; also compare Block A, columns III and IV in the two tables). Owner-cum-tenant farms remained the smallest category. In Sindh, tenant farms now comprised 63 per cent of farms with 51 per cent of the area (Block A, columns VII and VIII). In the Punjab, owner farms dominate in both number and area, and their proportion in each category is almost identical to the 1960 situation (compare Block A, columns III and IV in Tables 4.2 and 4.3 for the Punjab).
2. In the less than 5-acre category, Block B, now only 28 per cent of all of Pakistan's farms number can be observed (column I) with 5 per cent of total cultivated area. In the more than 150 acres category (Block G, columns I and II), 0.43 per cent of farms own 9.1 per cent of cultivated land.
3. The proportion of owner farms in the less than 5-acre category (Block B) has fallen to 41 per cent (column III) compared to 60 per cent in 1960, with a severe cut in the tenant farms category (Block B, column VII), which fell from 46 per cent in 1960 to only 22 per cent in 1972.
4. The owner-operated area in both provinces has increased somewhat over the period 1960–72.

The 1980 Census (Table 4.4)

1. Owner farms now constitute a simple majority in both number and area in Pakistan (55 and 52 per cent, respectively), and in the Punjab (54 and 50 per cent, respectively) (Block A, columns III and IV). In Sindh, tenant farms are the largest in number (49 per cent of all farms) (column VII), but owner farms have access to 47 per cent of total cultivated area in the province (column IV).
2. Thirty-four per cent of the number of farms in Pakistan are in the less than 5-acre category, and own 7 per cent of the land (Block B, columns I and II). Less than half a per cent, 0.34 per cent of the farms in Pakistan, own 8.5 per cent of the land (Block G, columns I and II).
3. Forty-two per cent of owner farms in the Punjab are less than 5 acres (Block B, column III), while of all tenant farms, almost half are in the 5–12.5-acre category (Block C, column VII). In Sindh, the largest number of farms (50 per cent) are in the 5–12.5-acre range, as they are in the Punjab (39 per cent) (Block C, column I).
4. Owner-operated farms are the predominant form in both provinces: 64 per cent in the Punjab, and 55 per cent in Sindh (Block A, column IX).

The 1990, 2000, and 2010 Census (Table 4.5)

The summary data available from the 1990 census shows that 47 per cent of farms in Pakistan were in the under 5-acre category and they owned 11 per cent of the farm area, while 0.3 per cent own more than 150 acres with access to 10 per cent of acreage.

Much of the trend we have seen since 1972, continues unabated across the last four decades. In fact, one can see a clear difference in many categories from Table 4.5, even over one decade, that of the 1990s. Some key features of the 2000 census reveal, that there is a more or less consistent fall in the average size of farms, that a majority of farms in Pakistan, especially in the Punjab and Khyber Pakhtunkhwa, are in the under 5-acre category, although the average size of holding in this category has fallen to what it was in the past. On the higher side as well on farms which are above 150 acres, one sees from Table 4.5, that while the number of farms has fallen, the average acreage has increased considerably. In fact, as Table 4.5 shows, between 1990, 2000, and 2010, the average size of farm has fallen in almost every single category except for the largest category suggesting greater consolidation of land holdings.

4.1.2 Changes Over Time

Having looked at some of the main characteristics in each of the census years, we should now turn our attention to what has happened over time and see how certain categories have shifted in importance. Let us turn to Tables 4.6 to 4.9.

Table 4.6 shows the *number of farms* with tenure classification across the four provinces. It shows how the shares of each tenure type have changed since 1960, and the share of farms in each province. Some highlights:

1. Owner farms increased from 41.1 per cent in 1960 to 68.8 per cent in 1990, to a further 81.8 per cent in 2010, for the whole country. Today, they dominate in each of the four provinces. Tenant farms fell in number from 41.7 per cent of the total in 1960 to 18.7 in 1990, falling further to 11 per cent in 2010.
2. In 1960, 69.6 per cent of farms in Sindh were tenant farms; in 2010, they constituted less than half what they were, at 25.7 per cent. Owner farms have increased substantially in these four decades in the Punjab (from 42.8 to 69.5 per cent in 1990, rising further to 82.4 per cent in 2010), as well as in Sindh (21.6 per cent to 70.3 per cent in 2010).
3. Punjab had more than 68 per cent of all Pakistan's farms in 1960, which fell to 58 per cent in 1990, but has increased its share to 63.5 per cent in 2010. The largest rise has been in the NWFP's share, which was 13.9 per cent of the number of farms in all of Pakistan in 1960, but rose to 21.1 per cent by 1990, to fall to 18.6 per cent in 2010, overtaking Sindh.
4. The share of tenant farms has seen a consistent downward trend, just as owner farms have shown a consistent upward trend over the six decades. Owner-cum-tenant farms have always been the smallest category, but showed a substantial rise during the 1960s, after which they have shown a rapid downward trend.
5. Since we are here looking at the change in the *number* of farms across the four decades, we can return to Tables 4.2

to 4.5, and observe that the marginal (under 5 acres) and small (5–12.5 acres) farms continued to dominate in the Punjab in 2010 as they had in 1960, and their share has risen from 79 per cent of all farms in 1960, to 90 per cent in 2010. Moreover, the pattern has been uneven; the share of 79 per cent in 1960 was followed by a sharp fall in 1972 to only 65 per cent, rising to 71 per cent in 1980, falling again to 68 per cent in 1990, rising once again. In Sindh, the distribution was as follows: 45 per cent in 1960, 70 per cent in 1972, 75 per cent in 1980, 80 per cent in 1990, with a slight rise in 2010. The patterns in the two provinces have followed a diametrically opposite trend, except in the 1972–80 period. The area of these groups, under 12.5 acres, as a proportion of total acreage in the Punjab in the six censuses has been 36, 30, 33, 40, 47, and most recently 58 per cent. In Sindh the acreage owned by these small farms was 27 per cent in 1960, 38 per cent in 1972 and 42 per cent in both 1980 and 1990, 40 per cent in 2000, but fell to 38 per cent in 2010.

Just as Table 4.6 showed the trend in the tenure and total number of farms, Table 4.7 shows the same tenure categories with *farm area*. Some features:

1. Like the number of farms, the area farmed fell consistently and systematically for the tenant farmer between 1960 and 1990, from 39.2 per cent to 16.1 per cent, to fall further to 11.1 per cent in 2010. Not surprisingly, in a mirror-image process, the farmed area of owner farms has risen considerably, most notably in Khyber Pakhtunkhwa. By 1990 owner farms dominated, by far, the total area farmed in all the provinces. Owner farms used to farm 38.3 per cent of total farm area in 1960; by 1990, this had risen to 64.9 per cent of total farm area rising further, to 73.3 per cent in 2000, and 74.5 per cent in 2010.
2. While owner-cum-tenant farms are fewer in number than tenant farms, they have considerably more land to farm than do tenant farms in the Punjab and NWFP.
3. Sindh, which used to have such a dominance of tenant farms (see Table 4.2) has seen a halving of the area farmed by tenants from 5.487 million acres in 1960, to 2.466 million in 1990, down further to 1.838 million acres in 2000. In all the four provinces, the area of tenant farms has fallen quite drastically. In Sindh, tenant farms constitute 26 per cent of all farms, but have access to only 13.1 per cent of the farm area.
4. Of the total farm area in the country, Punjab continues to hold the majority, but Balochistan has made considerable progress in increasing its farm area and in 2010 constituted 15.4 per cent of the total farm area of the country.
5. The total farm area in Pakistan fell from a high in 1972, in 1980 and 1990, but has increased marginally in 2000. Sindh and Balochistan have increased land on which farming takes place. Punjab has lost as much as 4 million acres since 1972.

Table 4.8 takes the data from Tables 4.6 and 4.7 and builds a series showing trends since 1960. The base year is taken to be 2000 = 100, and changes for each of the four provinces in the six censuses can easily be identified.

1. In the table, we see that in 1972 the index for the total number of farms fell in the NWFP and the Punjab, rising thereafter. The number of farms declined in the Punjab, but rose substantially in all provinces after 1980.
2. There has been a huge upward movement in owner farms and an equally impressive downward movement in the number of tenant farms although between 2000 and 2010 there has been a 7 per cent rise of such farms in the Punjab. Owner-cum-tenant farms, after rising, have fallen again.
3. With respect to farm area, owner farms have shown large increases, as tenant farms have lost considerable area. Owner-cum-tenant farms, after increasing their farm area in 1972, continued to lose area in 1980, 2000, and 2010.

Table 4.9 shows how the average farm area has changed over time. We see that the area under 5 acres went up over time in the Punjab, but has fallen between 1990 and 2010, It has also fallen in the 5–12.5-acre category in both Sindh and the Punjab. In the larger categories, between 50–150 acres, it fell a great deal in both the Punjab and Sindh between 1960 and 1990. In the extra-large category, after falling appreciably in 1972, presumably due to the land reforms of the Bhutto government, it rose again and more or less stabilized, but fell again in the 1990–2000 decade, although has risen sharply in the Punjab since.

4.2 What Do the Numbers Mean?

The overall nature of transition in agriculture can best be captured by Figure 4.1. While the three systems of agriculture—peasant, capitalist and feudal—can and do coexist, the trend has been for feudalism to give way to capitalism, which emerges and consolidates itself, while a peasant system is able to survive its onslaught. Figure 4.1 shows these changes with particular reference to Pakistan, where both the feudal and peasant systems are feeding the capitalist system within and outside agriculture (see also Appendix 4.2).

Possibly the single most important feature of the transition in agriculture depicted by the tables in this chapter is the marked fall in tenancy. Tenant farms have fallen sharply in both number and acreage across all sizes of holding in Pakistan. At the same time, there has been an impressive increase in owner farms and the area that they farm. In addition, the owner-operated area has shown a substantial increase in the 5–50-acre groups.

In the category of small farms that are less than 5 acres, we see a large decrease in their number and area between 1960 and 1972, but a considerable rise in both during 1972–80 and 1980–2000. The fall in tenancy between 1960 and 1972 is reflected in the large decrease in the number and area farmed. The later rise in both is not reflected by an equivalent rise in tenancy. There has been a large rise in the number of owners in the small category.

4.1.1 Data from the Censuses

The 1960 Census (Table 4.2)

Table 4.1, which appeared in Chapter 2 and is repeated here, presents some basic data about landholding in the 1950s, and is a good starting point for our discussion.

The main feature of Table 4.1 is that ownership was highly concentrated: 64.4 per cent of the owners owned 15.3 per cent of land, while the 6,061 owners (0.1 per cent) with very large landholdings, owned more (15.4 per cent). In Sindh, land ownership was even more skewed, with 29.1 per cent of land owned by a little over 3,000 people. In the Punjab, fewer than 2,000 owners owned 2.78 million acres, or about 10 per cent of the total area. In Sindh, the 8 per cent of owners who had holdings above 100 acres owned 54 per cent of the total land in the province. Thus, it seems that while both provinces had a highly differentiated structure of land ownership, Sindh was far more inequitable than the Punjab.

For the 1960s, we can make the following observations from Table 4.2:

1. Block A shows that in Pakistan tenant farms were the largest in both number (column VII, 42 per cent) and acreage (column VIII, 39 per cent). Owner-cum-tenant farms were the smallest of the three categories on both counts (columns V and VI, only 17 and 23 per cent, respectively). In Sindh, almost half (49 per cent) of the farms were tenant farms (column VII), which were 56 per cent in terms of acreage of the total area cultivated (column VIII). In the Punjab, owner farms had both the largest number (43 per cent, column III) and the largest area (38 per cent, column IV). We thus see a very different pattern of ownership and tenure in the two provinces in the 1960s, with more owner-operated farms in the Punjab, and greater tenant or sharecropper farms in Sindh.
2. In Pakistan, 49 per cent of all farms were in the under 5-acre category (Block B, column I). However, these 49 per cent had access to only 9 per cent of land. At the other extreme, those with more than 150 acres constituted only 0.29 per cent of owners, but owned 10 per cent of the total land (Block G). More than half of the total acreage in both Sindh and the Punjab is in the two categories which constitute the 5–25 acre group (Blocks C and D), with 54 per cent in the Punjab and 51 per cent in Sindh between 5 and 25 acres.
3. Of all the owner farms in the Punjab, 61 per cent lie in the under 5-acre category (Block B, column III), while in the 'tenants' category, half the farms in the Punjab are less than 5 acres (column VII). In Sindh, since only 18 per cent of all farms are less than 5 acres (Block B, column I), the three categories columns III to VIII constitute a very small fraction of the under 5-acre category.
4. The owner-operated area constitutes more than 50 per cent in the Punjab and only 37 per cent in Sindh (Block A, column IX). Tenant farming was far greater in Sindh than in the Punjab (Block A, columns VII and VIII).

Table 4.1
Distribution of Land Ownership in Pakistan and Provinces: 1950–55

Farm size (acres)	Pakistan		Punjab		Sindh	
	Number of owners	Area owned (acres)	Number of owners	Area owned (acres)	Number of owners	Area owned (acres)
All sizes	5,068,376 (100.0)	48,642,530 (100.0)	3,555,457 (100.0)	28,309,744 (100.0)	337,665 (100.0)	10,285,021 (100.0)
5 or less	3,266,137 (64.4)	7,425,614 (15.3)	2,358,119 (66.3)	4,438,517 (15.7)	100,601 (29.8)	365,817 (3.6)
5–25	1,452,421 (28.7)	15,438,138 (31.7)	1,029,108 (28.9)	11,041,708 (39.0)	155,163 (46.0)	1,937,073 (18.8)
25–100	286,470 (5.7)	10,616,308 (21.8)	146,893 (4.1)	6,198,128 (21.9)	54,792 (16.2)	2,390,358 (23.2)
100–500	57,287 (1.1)	7,671,537 (15.8)	19,401 (0.6)	3,842,986 (13.6)	24,064 (7.1)	2,600,123 (25.3)
500 and above	6,061 (0.1)	7,490,933 (15.4)	1,936 (0.1)	2,788,405 (9.9)	3,045 (0.9)	2,991,650 (29.1)

Note: The data for the Punjab are for 1954/5; for Sindh for 1946/7. The data for Pakistan are the aggregate figures for all provinces. The Punjab includes the former State of Bahawalpur, and Sindh includes the former State of Khairpur.

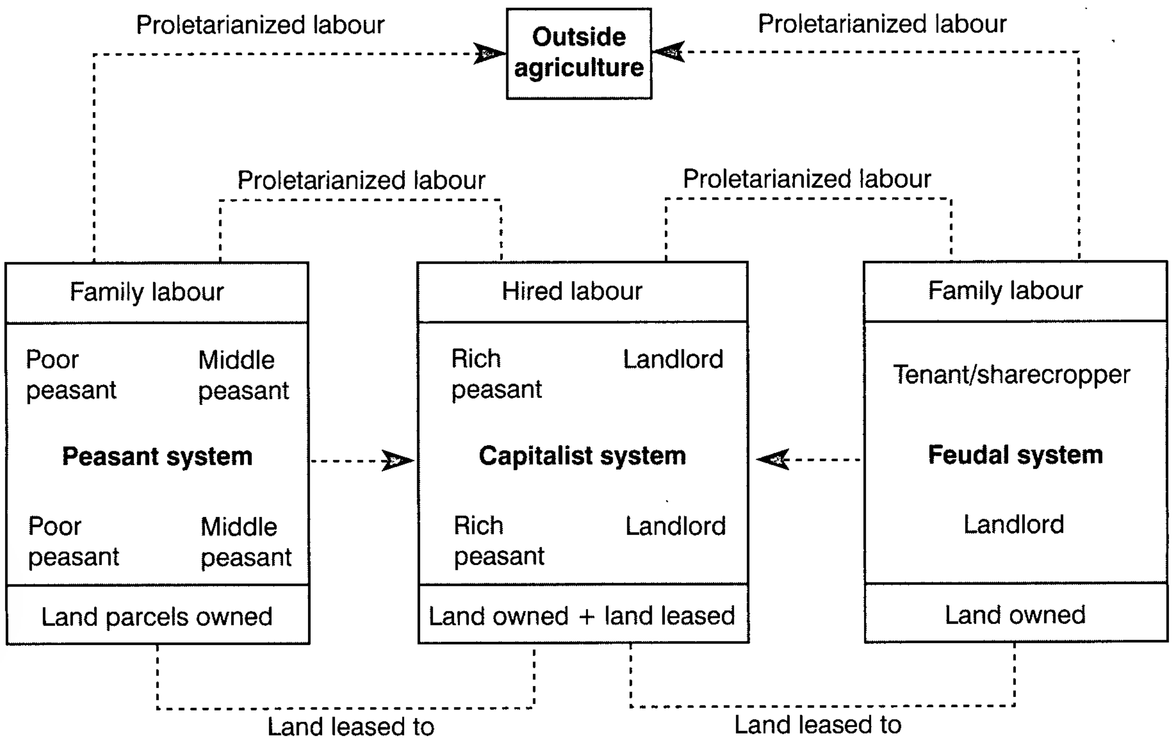

Figure 4.1
Agrarian Transition in Pakistan

Source: Khan, Mahmood Hasan, *Lectures on Agrarian Transformation in Pakistan* (Islamabad: PIDE, 1985), 17.

The category of 5–12.5-acre farms shows a consistent, and sometimes large, increase in all the inter-census periods. The growth of this category is probably the result of the fall in the number and area farmed in both the 12.5–25 and 25–50-acre groups during the period 1972–80. Both size categories, medium and large, lost a number of farms and a large chunk of their area during the 1970s. Between 1980 and 1990, the small category grew in number, although there was a small drop in the area owned and farmed. There was a continuous fall in the number of farms and area owned in both the medium and large categories in both Sindh and the Punjab between 1980 and 1990.

The category of very large 50–150-acre farms remained more or less the same in Sindh between 1980 and 1990, but continued to fall in the Punjab in this period, as it did in the 1972–80 period. In the category of extra-large farms, 150 acres and above, there was a sharp increase in both the number of farms and their area in Sindh between 1980 and 1990 with a small decrease in the Punjab in the same period. However, as Table 4.9 shows average farm size has fallen again in both Sindh and the Punjab, although there has been a marked increase in the average size of operational holding in the 150-and-over category in the Punjab.

The increase in owners and the decline in tenancy suggests that more and more landowners are acquiring land from tenants and are going in for self-cultivation, probably hiring in agricultural wage labour. It is unlikely that many of the tenants are in a position to become owners, so most of them will probably have been changed into agricultural or rural wage labourers or have migrated to urban areas and towns as they have been displaced by owner-cultivators. The dramatic increase in the area farmed by owners over the last four decades may indicate that tenants have been displaced and land brought under self-cultivation, or that many owners have bought land from other landowners. The tables show that the number of farms in the Punjab increased by about the same proportion as the increase in farm area. In Sindh, the number of owners increased much faster than the increase in farm area between 1960 and 1990. However, over this period there has not been a very sharp decline in agricultural employment: the proportion of those employed in agriculture fell from 60 per cent of the labour force to 45 per cent in 2012. It is likely that more sharecroppers and tenants have become agricultural wage workers than have migrated. This implies greater marginalization.

The growth in small farms at the expense of the medium and large farms may be due to greater fragmentation of landholding caused by inheritance, where many heirs may become owners of a single property which was hitherto of a larger size. Moreover, as we argue in other chapters, urbanization has also had a significant impact on land use in so called agricultural areas.

In the Punjab, there was a fall in farm sizes 12.5–25 acres, 25–50 acres and 50–150 acres between 1980 and 1990, and a rise in the number of farms in the 5–12.5-acre category, but with a small fall in area owned, causing the average size to fall. In Sindh, there has been a fall in the categories 5–12.5, 12.5–25, and 25–50 acres, with more or less no change in the 50–150-acre category. This seems to suggest that there is some consolidation of holding taking place on the high side (above 50 acres) in Sindh, with the hold of the extra-large Pakistani landowner (over 150 acres) slipping. However, the most notable phenomenon is the consistent rise of the small farm.

The method we have been using to discuss the nature and direction of agrarian transition very clearly reveals how insufficient and handicapped it is. If we had access to data based on class, or more elaborate data as depicted in Appendix–4.1, we might have been able to get a better handle on the nature of change. Had we known about the relations of production, whether labour was hired or land rented in, we would have been in a position to elaborate on the nature of *capitalist* development and how *capitalist* relations have been further developed. At the moment, we can see that more small farms are being created and many more owner-farms are emerging. However, we do not know how, and under what types of relations of production, these self-cultivators produce. It would be reasonable to assume that they are either family farmers or peasants who, in all likelihood, hire in labour. At the other end of the spectrum, the increase in the extra-large category suggests that these are capitalist farmers who have resumed their land from sharecroppers and probably hire in a large number of agricultural wage labourers. It is also possible that these large landholders have bought land from the medium and large farmers of between 12.5 and 50 acres, who have found it less profitable to farm as competition has increased further.

Mahmood Hasan Khan, who has differentiated the data based not only on size of holding, but also on the categories shown in Appendix 4.1, has been able to show us a clearer picture of the nature of the agrarian transition.[2] He looks at data pertaining to land rented in and rented out by various sizes of farms in the 1970s and finds that 'farmers owning 5 acres or less were renting their area out but the area so rented out also increased substantially in the seventies. . . . Owners of middle-sized farms 5–25 acres in the Punjab rented out land but in Sindh they rented in from others.'[3] This, he argues, is due to the very different nature of production in the two provinces: the middle-sized farmer in the Punjab is of the capitalist type of family farmer, while in Sindh this farmer employs sharecroppers. Furthermore, he says that in the Punjab the middle and poor peasants lease out increasing amounts of their land to others, while in Sindh sharecroppers rent in land from landlords. He also has evidence which supports our contention above, that in Sindh there was 'a shift towards capitalist farming through increased resumption of land by landlords from sharecroppers for cultivation by their own selves',[4] which is one reason why the size of farm has increased over the years in the extra-large category of over 150 acres. For Mahmood Hasan Khan, capitalist farmers are increasing in the Punjab and Sindh 'at the expense of poor and even middle class peasants in the former and against landlords and their sharecroppers in Sind'.[5] Elsewhere he argues that 'capitalist farming is . . . facilitated by the increased size of operational holding (farm)'.[6]

Finally, Table 4.10 shows quite dramatically how a number of important changes took place between 1960 and 1980. It would have been even more interesting to see the changes from the 2010 census, but data are not available in this form. Nevertheless, the table only amplifies and endorses the analysis presented above. It shows the following:

1. The number of pure owner farms increased considerably, as did their share of area, but not by as much.
2. Pure tenant farms were far fewer in 1980 than in 1960; their area also fell markedly, although their average size seems to have increased marginally.
3. Sharecropping also saw a very marked decline in this period, although some 'pure' tenant farms may have become owner-cum-tenant farms.
4. Overall, the total number of farms fell and so did the total farm area, but at a slower pace, resulting in an increase in the average farm size.

Although data in this form is not readily available, tables 4.6–4.9, all suggest that many of these trends have been considerably strengthened. The average farm size, however, has fallen considerably since the 1980s since the number of farms has, not surprisingly, also increased, due to bifurcation and inheritance.

Table 4.3
Distribution of the Operational Holdings by Size and Tenure in Pakistan: 1972 (in '000 farms and acres)

4.3 Summary and Further Reading

4.3.1 Summary

This has not been an easy chapter to deal with. It has been made cumbersome by the huge array of numbers presented here, which are no doubt off-putting for many readers. Nevertheless, we could not avoid the reference to these very useful and essential numbers. They bring together very important data from the 1950s to the present, and allow the interested reader to expand on the simplified and brief analysis presented here.

The essential purpose of the data presented is to enable the observation and study of the pattern of agricultural transition. We observe that tenancy and sharecropping, essential cornerstones of feudalism, have fallen drastically, both in the number of farms and in the area farmed. Tenancy farms and sharecroppers have been replaced by owner-operated farms. This is a major change in the pattern of agricultural production in Pakistan and shows the direction for the future. This chapter has also tried to show how different classes in agriculture coexist and the nature of their relationship with each other.

4.3.2 Further Reading

Although a number of books and papers have contributed on the agricultural sector in Pakistan, most have presented a static analysis and have not been concerned with change or transition over a period of time. The *process* itself has not been observed, and analysis has often been restricted to one point in time. This is a major shortcoming of such work, for it does not show how the present situation and structure have evolved. One major exception has been the work by Professor Mahmood Hasan Khan of Simon Fraser University, Canada, whose *Underdevelopment and Agrarian Structure in Pakistan* (Boulder, Colorado: Westview Press, 1981), and *Lectures on Agrarian Transformation in Pakistan* (Islamabad: PIDE, 1985), present a historical analysis and the process of development. Some of the references listed in Chapter 3, dealing with the Green Revolution, which was an important impetus to the nature and direction of the change discussed in this chapter, would also be useful for the reader.

Table 4.10
Summary Data on Number, Size, Area and Operational Status of Farms by Tenure Based on Agricultural Census Data: 1960–80

Private farms		Pure owner farms	Owner-cum-tenant farms			Pure tenant farms	All private farms
			Owner	Tenant	Total

Appendix 4.1

Classes in Agriculture

Mahmood Hasan Khan in *Lectures on Agrarian Transformation* writes:

> There are at present five distinct classes in the agricultural sector of Pakistan.
>
> First, there are landlords who own large areas of land and rent almost all of it in small parcels to landless sharecroppers. Landlords do not rent or lease land from others. Labour is entirely provided by the sharecropper households. Landlords neither work for themselves nor provide their labour-power to others. Their overlordship on land is exercised mainly through their agents (*kamdars*). In Sindh, for instance, sharecroppers play no role in production decisions. Profits and wages as economic rewards do not exist here; only rent exists. Primordial and traditional factors, and not economic considerations, play a central role in determining the nexus of landlords and tenants, including their shares in output.
>
> Secondly, there are farmers. Contrary to the popular perception in Pakistan that there are 'farmers' with complete homogeneity of interests, I emphasize heterogeneity. The capitalist farmers, who can also be called rich peasants, may own most or some of the land they cultivate and rent or lease from others part of it. They do not normally rent or lease their lands to others. Others' labour is the basis of production and source of surplus value for capitalist farmers. Landless workers or the so called free labour are hired for wages. Rich peasants do not sell their labour-power to others: they work on their land as entrepreneurs *par excellence*. They organize production, supervise free labour, and innovate. Profit and wages appear as basic economic categories for the first time in the distribution of output, although rent may still remain as an important component of income. Rent does not disappear.
>
> Thirdly, there is the class of family farmers who could be called middle peasants. This class consists of farmers who may own, rent or lease part of the land they cultivate. They may even rent, or lease out part of their land to others. However, these landowners depend almost entirely on family or household labour for production. They usually do not work for others, nor do they hire others to work on their farms. These farms are probably nearest to the classic peasant farm of Chayanov, the famous Russian economist who gave this idea and developed a theory of peasantry. Chayanovian peasants have shown great resilience in the face of capitalistic development of agriculture in history in Russia and other countries.
>
> Fourthly, there is the class of sharecroppers, or *haris* as they are called in Sindh. Landless sharecroppers rent all the land they cultivate and share the output with landlords on some traditionally-determined basis, often in kind. This class may include some poor peasants, whom I call marginal landowners and who must supplement their meager income by sharecropping on small farms of land rented from the landlord or others. Sharecroppers do not hire labour and depend almost entirely on their household labour. They may sell their labour-power to landowners to supplement their meager income. They are the linchpin in the feudal system which exists in parts of Pakistan even today.
>
> The fifth and final class is that of wage workers. This class consists of what I call unattached (landless) workers, who must earn income by selling their labour-power. They work mainly for rich peasants or capitalist farmers. Their wage is partly in cash and partly in kind. They may work on a permanent basis but most of them find only seasonal work. They may supplement their incomes by working outside agriculture. These workers constitute the burgeoning proletariat for agriculture and industry.
>
> I want to clarify here three points in [Table 4]. First, hiring of labour by landlords implies use of share-croppers, i.e. the labour power of others. It is a reference to the attached labour. Secondly, family farmers may work for others either in or outside agriculture. This, of course, depends on the requirement of the family farm and the level of income of the household to reproduce its labour power. Thirdly, share-croppers may also work for others outside the landlord-tenant nexus, either in or outside agriculture. Finally, leasing of land by capitalist farmers or rich peasants could be either from landlords to whom they pay the ground rent or from the middle to poor peasants on fixed payments.

Table 1
Agrarian class differentiation in Pakistan

Class	Land	Labour
1 Landlords	$LO > 0$	$SE = 0$
	$LR_o > 0$	$HL_i > 0$
	$LR_i = 0$	$HL_o = 0$
2 Capitalist farmers (rich peasants)	$LO > 0$	$SE > 0$
	$LR_o = 0$	$HL_i > 0$
	$LR_i > 0$	$HL_o = 0$
3 Family farmers (middle or poor peasants)	$LO > 0$	$SE > 0$
	$LR_o > 0$	$HL_i = 0$
	$LR_i > 0$	$HL_o > 0$
4 Sharecroppers	$LO = 0$	$SE > 0$
	$LR_o = 0$	$HL_i = 0$
	$LR_i > 0$	$HL_o \geq 0$
5 Wage workers	$LO = 0$	$SE = 0$
	$LR_o = 0$	$HL_i > 0$
	$LR_i = 0$	$HL_o \geq 0$

Note: LO = land owned; LR_o = land rented out; LR_i = land rented in; SE = employment; HL_i = hiring in labour; HL_o = hiring out labour.

Our typology cuts across the simplistic tenure categories of lessors and lessees. It also does not maintain a direct relationship to large and small holdings. Lessors could be landlords or even middle or poor peasants owning but not using land. Therefore, you may be lumping together in this

category different sorts of people such as landlords and small owners. Lessees could be capitalist farmers or sharecroppers and poor peasants supplementing their own holdings. So, you are putting together apples and oranges in one box. I am saying: get out of this box which is empty, nonsensical. A classification based on the arbitrary size and tenure categories does not reveal the true relations of production. They mystify the creation and appropriation of social surplus in agriculture. These groupings do not even assist in analysing the problems of farm organization in relation to the issues of efficiency and equity in Pakistan. Finally, and more importantly from the point of view of rural poverty, they do not reveal the impact of extraction of agricultural surplus for capitalist accumulation on each of the classes.

Appendix 4.2

Transition in Pakistan's Agrarian Structure

The agrarian structure has undergone several changes since the early 1950s. Some changes reflect the effects of various tenancy and land reform acts, but most have been brought about by rapid population growth, laws of inheritance, new technologies and the forces of markets, rural to urban migration and flow of remittances, and government policies of support prices, inputs subsidies, and farm credit. Landownership, as shown by individual records, is still quite concentrated, although the concentration seems to have declined in every province.

The number of owners and the area of small landholdings (less than 5 hectares) has increased somewhat; the proportion of large landowners (more than 20 hectares) has gone down from 2.7 to 2.0 per cent and their share in the total area has declined from 26 to 23 per cent. In Pakistan, about 96 per cent of the landowners have holdings of less than 10 hectares, but they own 64 per cent of the area. The highest concentration of landownership is in Sindh. Small landowners (with less than 2 hectares) are preponderant in the NWFP (96 per cent) and the Punjab (80 per cent), but they own only 55 and 36 per cent of the area in the two provinces. They comprise 40 per cent of all landowners in Sindh and own less than 10 per cent of the area. The large landowners (with more than 20 hectares) own 38 per cent of land in Sindh, 20 and 14 per cent in the Punjab and NWFP, respectively.

Three major changes in landownership seem to have occurred since the late 1960s. First, the ownership and area under very small landholdings have increased mainly due to the subdivision of holdings by the law of inheritance and rapid population growth, though some of it may be the result of distribution of land to the landless following the land reforms of 1972. Second, there has been a significant fall in the number and area of very large landholdings due to the intra-family land transfers in anticipation of and in response to the Land Reform Acts of 1959 and 1972. Finally the medium-size holdings (10 to 40 hectares) have gained, especially in Sindh, both in number and area.

Of course, not all landowners cultivate their land, either their own or anyone else's, and not all cultivators own land. There are, therefore, several tenancy arrangements for cultivation purposes, of which the sharecropping tenancy and self-cultivation by (mainly small) landowners are the major forms. The access to land for cultivation is reflected in the distribution of 'operational holdings' or farms by size and tenure. The data on changes in the distribution of farms and farm area by size and tenancy have been published in the 1960, 1972, 1980, and 1990 Agriculture Census Reports. Generally speaking, Sindh has had the least concentration of farms due mainly to the widespread sharecrop tenancy; NWFP has been at the other end because of the preponderance of self-cultivation of small holdings as evident from Table 2. Note that land concentration has declined mildly in all provinces since 1960, but with some interesting changes during the period of 1960 to 1990. Apparently, land concentration fell significantly in the 1960s, but rose marginally in the Punjab and Sindh in the 1970s and substantially in all three provinces in the 1980s. These changes reflect a clear tendency towards reduced sharecropping tenancy and increased incidence of self-cultivation on all farm sizes.

The average farm size has declined from 5.3 hectares to 3.8 hectares, but the average size of large farms has increased. The number of farms has increased from about 3.75 million in the early 1970s to just over 5 million in the early 1990s. The share of small farms has increased slightly (from 67 to 71 per cent) in number but declined in area from 52 to 39 per cent. These changes reflect the large relative increase in the number and area of very small farms. While the share of large farms has fallen in number (from 11 to 7 per cent) their share in the area fell only slightly from 43 to 40 per cent. Tenurial arrangements seem to have changed significantly in the last thirty years. The proportion of owner-operated farms has increased significantly both in number and area. In fact, the owner-operated area has increased from just over one-half to three-quarters of the total farm area. Most of the owner-operated farms are small and located in the Punjab and NWFP. Sharecropping is still the major form of tenancy, especially in Sindh and some areas of the Punjab and NWFP. Sharecropped farms are in the range of 3 to 5 hectares, but they have declined sharply in both number (34 to 19 per cent) and area (from 30 to 16 per cent). A similar reduction has been observed in the case of 'owner-cum-tenant' farms, but large farms have been increasing. The tendency away from sharecropping is clearly reflected in the reduction of tenant-operated area from 46 to 26 per cent of all farm area. It seems that large landholdings dependent on tenants have also reduced their tenant-operated area.

The transition from the quasi-feudal to the capitalist mode of agrarian structure in Pakistan has made the land tenure system even more differentiated than it was before the 1960s. The capitalist farmers have emerged from the ranks of landlords and rich peasants. Labour is increasingly provided by landless workers, who could be from among the poor peasants (family farmers) and displaced or evicted sharecroppers as the landlords transform into capitalist farmers by extending their self-cultivated (khud kasht) area. However, not all of the landless labour is absorbed in the

Table 2
Changes in inequality in landownership and access to land 1950/1990

Year	Landowners and owned area				Operational holdings and farm area

Source: The data for landownership by holding size are from the Federal/Land Commission based on individual land records. The data for operational holdings (farms) and farm size are from the Agricultural Census Reports of 1960, 1972, 1980, and 1990.

Note: The ratios are the Gini Coefficients for landownership and access to land use.

capitalist sector of agriculture. Increasing numbers of unattached workers are either engaged in non-farming activities in the rural area or migrate from the village to towns and cities.

The gradual dissolution of the quasi-feudal and peasant systems has revealed several interesting features. In the landlord-tenant system, landlords have not entirely been in favour of evicting the sharecroppers on a large scale. This is partly to avoid legal problems which a large-scale tenant eviction could cause. The more important reasons are perhaps economic. Subsidized inputs, including tractors and other machines, since the late 1970s have raised private profits which the landlords are unwilling to share with their tenants. On the demand side, the structure of production has been changing in terms of cropping patterns in response to the growth of urban population, rising income levels and expanded export opportunities. Some landlords have, therefore, adopted the policy of sharing the cost of all modern inputs with sharecroppers, including those which have weakened the tenants' bargaining position by making the cost of animal power high to maintain. Also, landlords have expanded their self-cultivated area, mainly by reducing the size of parcel they give to each sharecropper. These policies increase the pool of dependent and relatively cheap labour without increased dependence on seasonal wage labour, the supply of which may be uncertain and costly.

In the peasant system, increasing involvement in non-farming employment and migration of part of the household labour have become a necessity for the poor and even middle peasants since they bring additional income for survival. Non-agricultural incomes, particularly remittances from outside the rural area, have also become a source for acquiring additional land which can be leased or bought from the poor peasants (small landowners) who cannot evidently survive on their incomes from the small plots they own. Addition to one's landholding means increased chances of survival in farming, with reduced vulnerability to competition from rich farmers, or even of joining the ranks of capitalist farmers. The peasant system at the lower end has probably thus extended its life-span and remains a contending force to the rapid development of capitalist agriculture in Pakistan.

The growth of wage labour is an indicator of changes in the agrarian structure. Despite the decline in the proportion of labour working in agriculture, from 60 per cent in the early 1960s to around 45 per cent in the mid-1990s, the absolute numbers are still rising. The level of demand for labour and the conditions of employment are directly affected by the organization and performance of the agriculture sector itself. Employment in agriculture is of two types: (i) self-employment as household labour on farms cultivated by small landowners and tenants, and (ii) hiring out of labour by the households of landless non-farming workers, tenants and small landowning peasants. Several significant changes have occurred in the composition and use of labour in the last twenty-five years. The use of family labour on small farms has not declined by much, but its use on larger farms has certainly fallen. While permanent hired labour was traditionally used mostly on large farms, fewer farms are now reporting its use. A high proportion of farmers now hire casual labour: its share in wage labour has increased from 30 to nearly 55 per cent. Pakistani farmers no longer depend entirely on family workers and most of them engage outside workers, at least for some of the time during the crop season. It is also a fact that an increasing proportion of the labour from farm households is engaged in non-farming activities on a short- or long-term basis because wage income from farming activities is insufficient to meet the growing needs of the family in a cash economy.

5 Agriculture: Critical Issues

In the previous three chapters, a history of the development of agriculture in Pakistan has been presented, where the focus has been on the changes that have taken place since the time of the Mughal Empire. So far, we have discussed how the process of change was initiated and the nature of that change. We have seen how, from pre-capitalist or feudal modes of production in agriculture, capitalist forms emerged and how they then established themselves, becoming the dominant form of production. In all of this story of agriculture, we have seen how economic and social relations have changed over time. However, while we have learnt a great deal about this transformation in agriculture, we have learnt nothing about what is grown, what actually constitutes agricultural production, and so on. This chapter will fill that gap.

We will first introduce the nature of agricultural production itself—crops grown, yields, area under cultivation, etc. The purpose will be to inform the reader about Pakistani agriculture and how it has changed since 1947. After a broad overview, salient contemporary issues related to agriculture will be introduced and discussed before we close this part of the book on the agricultural sector.

5.1 An Overview and Major Trends

The agricultural sector in Pakistan is classified as containing five subsectors: major crops, minor crops, livestock, fisheries, and forestry (see Figure 5.1). While the major crops make the largest contribution to the GDP from the agricultural sector as Figure 5.1 shows, their contribution has fallen considerably in the last thirty years. In fact, the fall in the contribution from major crops has been made up by an increase in livestock farming and production, or the 'white dairy revolution', as it is being called, where livestock's contribution has doubled in thirty years.

The rabi (winter) and kharif (summer) seasons divide the agricultural calendar. In rabi, the main food crop grown is wheat, with tobacco the largest cash crop. In kharif, cotton and sugar cane, both cash crops, are cultivated along with rice as the main food crop. Interestingly, it is the kharif season that provides Pakistan with its most important exports, cotton and rice, and hence floods due to excessive or prolonged monsoons can play havoc, not just with agricultural production, as they did in 2010 and 2011, but also with industry and exports. As we show in subsequent chapters, this has been the case many times in Pakistan's past.

The extent of change in Pakistan's overall economy and society over the last 65 years can best be summarized in a single figure which shows the extent of the contribution of agriculture to Pakistan's gross domestic product (GDP): in 1949/50, agriculture was by far the largest sector, contributing more than 53 per cent to GDP; in 2012, this share was down to only 21.1 per cent, i.e. less than even one-quarter. This is despite all the progress, growth, and development that was made in agriculture following the Green Revolution, and other salient milestones. While in 1949/50 agriculture contributed more than half of GDP, today the services sector contributes half, and is more than twice as large as agriculture. Another equally important statistic regarding agriculture is the fall in the share of the labour force employed in agriculture, from 65 per cent in 1950/1 to 45 per cent today, although agriculture is still the largest sector in terms of employment. However, rural areas now also have a large economic component called the 'non-farm' or 'non-agricultural' sector, which generates almost 60 per cent of total rural incomes, a significant development in the rural and agricultural sector in Pakistan.[1]

The total geographic area of Pakistan is 79.61 million hectares (or 196.64 million acres), and the 'reported' area in 2012 was 73 per cent of the total area (Table 5.1). (The reported area is that amount of the total geographical area for which official records exist. It has risen to 73 per cent today from 58 per cent in 1947/8.)[2] The non-reported area (27 per cent of Pakistan) for which records do not exist 'is due to large tracts of unsettled lands in most parts of the northern tribal territories in Khyber Pakhtunkhwa and in the north-western and western parts of Balochistan; some south-eastern and eastern desert areas in the Punjab and Sindh are also included'.[3] The fact that there has been an increase of 13 per cent in reported area since 1947 shows that larger areas and tracts of the land have become 'officially' part of Pakistan and are accountable for. This process is important for revenue records, inheritance and other purposes.

For agricultural purposes (and our analysis) the reported area is the relevant area. As one would expect, however, not all of the reported area is cultivable—in fact, in 2012 as much as 41 per cent of this area was not available for cultivation (Table-5.1 and Figure 5.2). In 1948 this proportion was 48 per cent, while in 1980/1, only 37 per cent of the reported area was uncultivable. This interesting trend is like a U-shaped curve, where the area not available for cultivation is very high in 1948, almost half of reported area, then falls, implying that more land as a percentage can be cultivated upon, and then rises again in the late 1990s. There are probably two very important reasons for this trend. Firstly, as we have seen in earlier chapters, following the commercialization of agriculture with Green Revolution technology, more land

Table 5.1
Land Utilization: 1947–2012 (in Millions of Hectares, with a Total Area of 79.61 Million Hectares)

Year	Reported area	Not available for cultivation	Total area cultivated	Area sown more than once	Total cropped area
1947/8	46.70	20.82	14.69	0.95	11.63

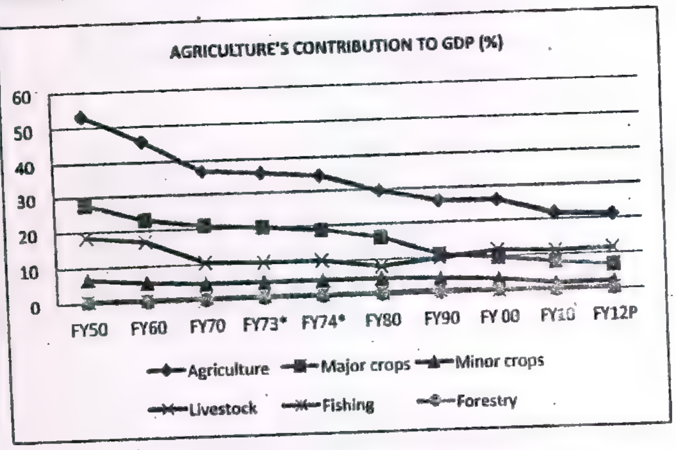
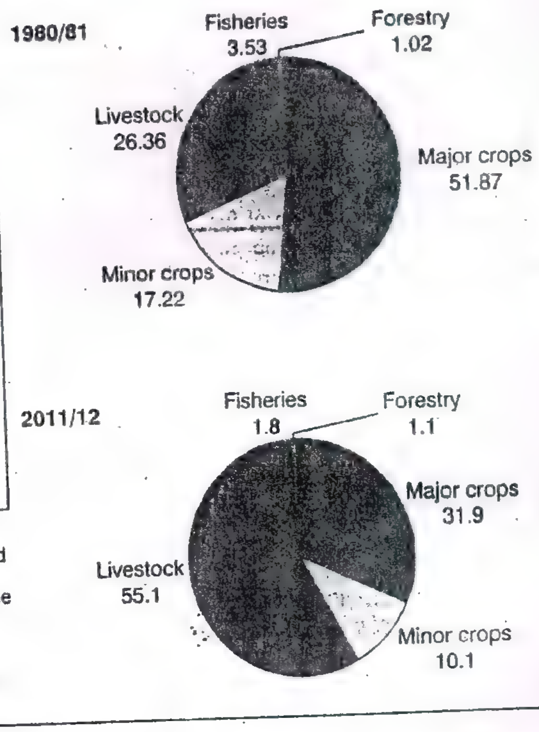
Forestry	0.5	1.02	1.13	1.1





Rabi (winter) crops: wheat, barley, gram, tobacco, rapeseed, and mustard

Kharif (summer) crops: cotton, rice, sugar cane, bajra, maize, and sesame

Food crops: wheat, rice, bajra, jawar, maize, barley, and gram

Cash crops: cotton, sugar cane, tobacco, rapeseed, mustard, and sesame

was brought into cultivation—this explains the increase in cultivable area. The fall in later years could be due to the faster increase in reported area compared to the colonization of new land. But since reported area has increased by only 20 per cent over the last five decades, compared to the 30 per cent increase in total area cultivated, this cannot be the case. The other reasons could be increasing urbanization, where urban land has been creeping on to agricultural land for the purposes of industry and residences, especially in the Punjab; or waterlogging and salinity, which is slowly eating away the land that was once cultivable. In the last decade, since 2000, it seems that there has been a far sharper rise in the process of transforming agricultural land into urban and semi-urban housing, resulting in further and growing urbanization.

Total cultivated area in Pakistan was 36.3 million acres in 1947[4] and 54.59 million acres in 2012. It was 32 per cent of reported area in 1947 and now constitutes 38 per cent. Table 5.1 provides basic data about land utilization in Pakistan. From the table we see that, as irrigation has expanded, so has multiple cropping (area sown more than once). In the period 1960–5 only 9 per cent of the total area cultivated was used for multiple cropping, while by 2012, this had risen to 32 per cent.

If we examine the data in Tables 5.2 to 5.7 regarding agricultural output and production, a number of interesting features are observed.

1. Table 5.2 shows that in terms of agricultural production, not surprisingly, all agricultural products have increased. With newer technology, more land available, increased demand both domestic and foreign, Pakistan's agricultural production has increased manifold. In Table 5.2 two sets of series with their base years in 1959–60 and 1999–2012 show that production more than tripled in many categories by the mid-1980s, and then compared to 1999/00 has increased by about 25 per cent in food and 'other' crops. Nevertheless, while there is much variation from year to year, it seems that in the last decade there has been an upward trend.
2. In Table 5.3 we see that the total area under food crops has increased by more than 50 per cent since 1959/60. Wheat is the largest sown crop and today constitutes 66 per cent of the total area of food grains, up from 60 per cent in 1959/60. For the four major crops of Pakistan, the area under wheat in this period is up 111 per cent, rice 160 per cent, cotton 116 per cent, and sugar cane 313 per cent. In the 1960–5 period, the four major crops covered about 53 per cent of total cropped area, whereas by 1995/6 this had increased substantially to 64 per cent, and in 2011/12 to 66 per cent. (see Figure 5.3 for changes in the relative positions of crops).
3. Total production shows that between 1950–5 and 2012 (Table 5.4) for all major as well as minor crops, there has been a very substantial increase—almost seven-fold—in total output over the last sixty-two years. Although overall output for major crops has increased, what is discerning is that the *rate of increase*, the average annual growth rate of major crops since 1980, had fallen, but has made a very marked increase over the last few years, particularly after 2010 for wheat and sugar cane, while rice production also rose after 2005. In the decade 1980–90, the average annual growth of major crops was 3.34 per cent, which fell to around 2.4 per cent in the 1990s. Both total production of wheat and rice fell sharply in the three years following 1999/00, as did production of all food grains. While lower rates of increases in output are a disturbing factor, so too is the instability and variability in output from year to year.
4. While increases in total area sown and total quantity produced are important in their own right, yield per unit of land (per acre or hectare) is a better indicator of how agriculture is progressing. Table 5.5 shows the average yields for major crops. Comparing the period 2012 with the early 1950s, wheat's yield is up from 776 kg/hectare to 2,774; rice is up from 878 to 2,218, although much of this improvement came in the early years; sugar cane is up from 29,180 to 55,000; and cotton is up from 212 to 770. This table, perhaps, best exemplifies the huge impact of the Green Revolution, where due to the high yielding variety seeds for wheat and rice there was a marked increase in output. For example, between 1960/5 and 1974/5, the yield for wheat increased by 59 per cent, and for rice by 55 per cent. Between 1974/5 and 2012, the

yield for rice increased by 43 per cent, although the yields for wheat continued to show large increases, by as much as 121 per cent. However, it now took two decades to achieve what was achieved earlier in only one decade. Just as output has varied and been instable, so has yield per hectare. In the period 1990–2001, wheat's yield was up in only five of these eleven years, falling below the previous year's in six years; rice did only marginally better and improved on yield output in seven of these eleven years.

5. Table 5.6 shows how the sources of irrigation in Pakistan have changed over the last forty years. In 1950/1 canals provided 81 per cent of all irrigation, while in 2011/12 they provided 60 per cent. Tube wells, which were almost non-existent in the 1950s, now provide as much as 37 per cent of irrigation.

6. Given the rise in output and production over the last few years, one might assume that the people of Pakistan are better fed now than they used to be. However, the high growth in population might indicate that on a per capita basis they are not any better off. Table 5.7 shows that, in fact, since 1986/7 the per capita availability of the most important foods has varied a great deal. Wheat availability is below the 1986/7 level and considerably lower for rice. However, meat and milk production, indicative of the growth in the livestock sector, have increased considerably over the last 25 years. The rise in milk availability is indicative of the 'white revolution' which has taken place in the dairy sector in Pakistan over the last decade. However, this table should be taken as indicative only, for it does not show either distribution or the amount actually consumed. Availability may suggest production, but it does not take account of exports, losses, or actual consumption. Moreover, with high and rising food inflation since 2008, the ability to buy these food items becomes out of reach for numerous potential consumers who may shift to cheaper substitutes.

7. Figure 5.4 shows the overall annual growth rates in agriculture since 1949/50. We can see that growth in double figures took place in only three years, with negative growth in six. The highest growth achieved in any one year was 13.6 per cent in 1953/4–1954/5, with the lowest being –9.1 per cent, in the very early years. The trend seems to be more unsettled in the first fifteen years after 1949, and settles down in the mid-1960s. In the last three decades, there has been substantial year-on-year fluctuation in the growth rates of the agricultural sector, also having an impact on the economy overall.

While agriculture was the dominant sector of the economy in 1947, having a substantial share of employment and being the main contributor to GDP until about 1958, agricultural output and production stagnated, with the growth rate between 1949 and 1958 being only 1.43 per cent, which was less than half the growth rate in population. This meant that even the per capita consumption of food grain declined in this period. Food had to be imported and there was a heavy dependence on foreign aid and other hand-outs, many of which came with strong political overtones and consequences. It was possibly the realization of the need to

become somewhat less dependent on foreign money, and to make agriculture more profitable, which led to a number of very important interventions in the agricultural sector in the 1960s.

The land reforms of 1959 may have been a failure in terms of land redistribution (see Chapter 4), but they caused a significant shock to a moribund system. The Green Revolution technology was a critical factor in the impressive growth rates in agriculture achieved in the 1960s. Viqar Ahmed and Rashid Amjad write:

> Growth rates in the agricultural sector were significantly high in both the first and second half of the sixties. During the first half, the years of high agricultural growth were between 1960–1 and 1962–3 and then between 1963–4 and 1964–5. There was a marked slowing down during 1965–6 and in 1966–7. There was a very slow recovery in food crops in 1966–7 although overall agricultural growth was positive from a very low base of the previous year. The first significant year of the so called 'Green Revolution' is between 1966–7 and 1967–8 when agricultural growth increased by 11.7 per cent after which there were significant increases in the next two years especially between 1968–9 and 1969–70.[5]

The early 1970s also saw a second set of land reforms, which were much stricter in application, but did not produce the same results as the 1960s. Agriculture grew by a minimal 2.3 per cent between 1972 and 1977—well below the growth rate in population. While political uncertainty in the country may have caused overall production to be below historical trends, three of the five years of the Bhutto government had floods and pest attacks in which crops were severely

damaged, resulting in low output. The government wanted to follow a pro-agricultural policy by devaluing the rupee, so as to increase agricultural exports, and by increasing the support prices of agricultural commodities. However, inclement weather ensured poor output. The late 1970s and 1980s witnessed a return to an overall healthy growth rate in agriculture despite a few noticeably bad years.

Before we turn to specific issues, it is worth looking at one theory which examines how output and productivity in agriculture are affected over time. Rashid Faruqee of the World Bank, used analyses developed by Derek Byerlee, who divided the growth in output due to technical change in countries like Pakistan into four stages. Rashid Faruqee described these stages as follows:

> (1) the pre-Green Revolution phase, when growth is driven by (irrigated) area expansion, and productivity growth is modest, (2) the Green Revolution phase, when growth is driven by high yielding varieties with increased responsiveness to inputs, (3) the first post-Green Revolution phase, when growth is driven by intensification of input use, especially chemical fertilizer and irrigation water (which facilitates multiple cropping), and (4) the second post-Green Revolution phase, when input use begins to plateau, and the source of growth becomes increases in input efficiency, coupled with the ongoing release of new varieties. According to this framework, the Green Revolution shifted the production function upwards and raised the marginal responsiveness to inputs. Farmers did not operate initially on the production frontier. In the first post-Green Revolution phase, use of complementary inputs rose and farmers improved allocative efficiency (equalizing marginal products and prices). In the second post-Green Revolution phase, farmers encountered diminishing returns to inputs, and moved towards the production frontier by raising their efficiency. Resource degradation is a form of technical regress which would shift the production function downward.[6]

This scenario seems to fit Pakistan, which is now, according to Rashid Faruqee, in a second post-Green Revolution phase, where input efficiencies are seen to be the main sources of growth now that high yielding variety seeds have been extensively disseminated and the use of irrigation and fertilizer is levelling off. While in the past, land expansion, multiple cropping, liberal availability of water, and a technical package were responsible for high growth in agriculture, for Rashid Faruquee, 'future growth must rely almost entirely on efficiency gains, the potential for which is considerable'.[7] For the World Bank, these efficiency gains arise through, amongst other mechanisms, output prices that are 'market determined', where the government does not 'distort prices', ends all forms of directed credit, and introduces a large number of institutional reforms. The significant increase in support prices by the Pakistan People's Party government 2008–13, which resulted in farmers receiving far higher prices for their produce—wheat's price was doubled from Rs. 425 in 2006/07 to Rs. 950 in 2008–09, while Basmati rice rose from Rs. 460 in 2005/06 to Rs. 1,250 in 2009/10, with IRRI rice also doubled—vindicates the claim that farmers are rational and respond to price incentives. The jump in food production—as well as domestic food prices for consumers, of course—after 2009, despite the extensive floods in 2010 and 2011, is indicative of these incentives. See Appendix 5.1 for the World Bank's view on Pakistan's agriculture. Some other recommendations as part of the Structural Adjustment Programme can be seen in Appendix 5.2 and Chapters 16 and 17. The next sections discuss some of these issues.

5.2 Agricultural Pricing Policy

As the last paragraph indicates, and as we have seen in Pakistan over the last five years since 2008, government can play a critical role in determining what, and how much, to produce through its pricing policy. Along with the right types of seeds, water, fertilizer, and other inputs, as well

as a package of technology and credit, the pricing policy of agricultural inputs and outputs can determine the direction of agricultural productivity and produce. Agricultural pricing policies can also impact significantly on income distribution, with particular reference to the incomes of small farmers. The consumer boom noticeable in Pakistan's rural areas since 2008/09, is proof of the fact that higher prices for farmers, despite inegalitarian land holdings such as Pakistan's, can have a positive impact on the overall rural economy, simply by giving the right price incentives. They can also have a noticeable effect on industrial productivity, urban wage goods, exports, and the cost of living, determining the terms of trade between agriculture and other sectors. Higher prices for agricultural commodities which might mean higher incomes for farmers, also translates to higher prices for urban consumers, a fact also noticeable in Pakistan in recent years. A good agricultural pricing policy can be defined as one where, *ceteris paribus*, price acts as an incentive to produce certain goods in required quantities (see Box 5.1). This, however, has not always been the case in Pakistan, and agricultural prices have been used for various purposes by different regimes. Appendix 5.3 shows how support prices for agricultural commodities were determined.

The comprehensive report of the National Commission of Agriculture (NCA) in 1988 examined the issues around the agricultural pricing policy of the first two decades following 1947, and had this to say:

> In the beginning, Government's main concern in regulating agricultural prices was to keep the cost of food low for the urban industrial workers and provide cheap raw materials for domestic industries. The objective was to enhance international competitiveness of the infant industries by maximizing the so called 'labour' advantage. The main features of the Government trade and pricing policies during the period up to the mid-sixties were as follows:
> a) Government fixed retail consumer prices of foodgrains at low levels which had the effect of depressing market prices for producers. Studies show that during this period the domestic prices of foodgrains remained consistently below the international parity prices calculated at the equilibrium rate of exchange.
> b) Heavy export duties were levied on cotton which had the effect of reducing domestic prices of cotton for the benefit of the local textile industry.
> c) Monopoly procurement of wheat and rice was resorted to at fixed prices which were deliberately kept low in order to minimize subsidies to consumers. Producers often sold to merchants at lower than the Government prices in order to receive prompt cash payments.
> d) Inter-district and inter-province restrictions of movement were imposed with the result that producer prices were depressed in the surplus producing areas.
> e) Prices of vegetable ghee were controlled at an artificially low level which had a depressing effect on producer prices of seed cotton and oilseeds like rapeseed and mustard.
> f) Proceeds from the agricultural exports were converted at an overvalued fixed exchange rate. The implicit exchange tax on agricultural exports from 1960 to 1971 averaged 89 per cent. In contrast, the industrial sector benefitted from the overvalued exchange rate which reduced the domestic cost of imported machinery and other inputs. When it came to the industrial exports, the exchange losses were offset by bonuses and subsidies. This heavy protection of the industrial sector at the cost of the agricultural sector failed to produce an efficient and viable industrial base for the economy. It rather became the cause of the dismal performance of the sector despite its highly privileged position.
> g) For nearly a decade after independence no systematic attempt for the development of agriculture was made. The first agricultural development programme in the country was launched in 1955.
> h) Barter deals were a common feature of Pakistan's international trade in which agricultural produce was exchanged for industrial machinery and inputs to the disadvantage of the agricultural producers.
> i) Government freely accepted the agricultural commodity imports at concessional prices which, when converted at the overvalued exchange rate, resulted in depressing the domestic prices. The adverse effect of the imported commodities was further intensified by budgeted subsidies given by the Government on their local sale prices.[8]

It is not surprising that, due to the above policies, agriculture suffered and was seen as a means to subsidize industrial production and urban consumers—part of the pro-industrial strategy which was heavily biased against agriculture. As the NCA Report argues, 'the implied objectives of the pricing policies during the period 1960–5 were to provide low cost food to the urban consumers, to provide cheap raw materials for the domestic agriculture-based industries, to keep wages of industrial workers low by supplying cheap food, and to transfer resources from agriculture to the urban sector for investment in industries and other non-farming activities'.[9] Clearly, these policies were not focused on improving and expanding agricultural output.

For some strange reason, it was assumed that farmers would not be price sensitive and would produce at their most efficient and best output regardless of the prices received by them. Policymakers assumed that 'low prices resulting from compulsory government procurement or high export duties on agricultural products would not affect the output level'.[10] However, the dismal conditions in agriculture prior to the Green Revolution forced the government to reconsider its approach to the agricultural sector, and along with the technical package, new pricing policies were also introduced so as to encourage agricultural output. Viqar Ahmed and Rashid Amjad argue that 'a recognition of the role of prices in agricultural development did provide much needed incentives to the growers, and may have partly contributed to the high growth rates in the late sixties'.[11]

Box 5.1

The Objectives of an Agricultural Pricing Policy

The study by the National Commission of Agriculture argues as follows:

> Pricing of agricultural inputs and outputs would be a major element of the dynamic agricultural policies necessary to achieve national targets of agricultural production. The Government should pursue an active price support policy seeking to consolidate the gains in four major commodities achieved in the last few years, making the policy fully effective for minor crops including oilseeds and extending the policy to cover more products as found necessary. The pricing of inputs and outputs should be closely coordinated keeping in view the following objectives:
>
> i) Carefully devised price signals can promote a balanced increase in production of agricultural products so as to fulfil domestic consumption requirements; increase earnings of foreign exchange through exports of products like cotton, rice and horticultural products, and save foreign exchange expenditure by reducing dependence on imports of agricultural products, especially edible oils, milk, and sugar.
>
> ii) Gradually rising but stable prices can create a suitable economic and psychological framework for positive response from producers to production incentives and move to the desired cropping patterns.
>
> iii) The Price Policy should help to achieve and maintain equitable terms of trade for agriculture and support the incomes of farmers.
>
> iv) It should help maintain stable food prices for consumers.
>
> v) It should keep domestic prices of export commodities and potential exports largely in line with the international prices to maintain competitiveness of agricultural commodities and minimize subsidies.
>
> vi) It should encourage larger investment in agriculture, especially in production of the products in which the national targets call for major increases in production.
>
> vii) It should encourage increase in agricultural productivity and reductions in production costs by promoting the use of better technologies and other non-price measures.

Source: Government of Pakistan, Ministry of Food and Agriculture, *The Report of the National Commission on Agriculture* (Islamabad, 1988), 490–1.

Viqar Ahmed and Rashid Amjad present a more holistic view of agricultural prices. They write:

> The determination of the prices of agricultural crops by the government, along with other administrative and economic controls on their processing, distribution and export, amount to the suppression of the market mechanism. But markets in Pakistan, as in other developing countries, are hardly perfect. Imperfections in the form of under developed transport and communication facilities, a high degree of heterogeneity among both the buyers and the sellers, and the division of the market into small isolated sub-markets, make the market system incapable of generating a substantial degree of competition. The farmers belong to a highly differentiated structure of interests in land, ranging from sharecroppers and tenants to owner-cultivators and still further to capitalist farmers and absentee landlords. Most farmers have little contact with the market either because they are subsistence owner-cultivators without a marketable surplus or because they are sharecroppers whose surplus is taken away by a non-cultivating class.
>
> State intervention under these circumstances is essential in order to create a mutually accommodating price-structure. This could allocate land and other resources among competing crops and also reconcile prices of agricultural output with the overall cost structure within agriculture. Inter-sectoral terms of trade between agriculture and other sectors also need to be maintained at levels which would eliminate causes of social frictions and distortions in development priorities.
>
> It is quite obvious that in the foreseeable future the agricultural price policy will have to be framed in such a way so as to achieve conflicting objectives like incentives for the farmers, stability of the urban cost of living, easy domestic availability of food grain and industrial raw materials, and adequate exportable surplus. In addition, small cultivators, including subsistence farmers, have to be given access to new inputs and technology and also to the benefits of the subsidy programmes so that these large public outlays do not become the cause of widening social disparities. . . .
>
> . . . What is required in this situation is to look beyond subsidies as a policy instrument, and to pay serious attention to such matters as improving the overall supply position of the inputs, particularly such divisible inputs as seeds, fertilizers and pesticides, and to ensure their timely availability. Attention should also be paid to the extension of rural outlets, the encouragement of multiple market channels, and the improvement of the farmers' ability to make efficient use of the inputs. As the supply position improves, it would be easier to reduce the subsidy level and to allow prices to rise gradually. If the farmer has access to institutional credit and is able to increase his net returns, an increase in input prices may not inhibit his demand for them.
>
> There is also a need to gradually raise output prices so that resources now tied to consumer subsidies are released for other purposes on the one hand and, on the other, the farmer can confidently look forward to larger cash flows and can plan his investments for a longer period than one or two crop seasons. It is imperative that the price signals sent to the farming community should be unambiguous and have a certain amount of continuity.
>
> Finally, an agricultural price policy by itself cannot necessarily serve as a grand design for major institutional or technological changes. It can serve limited goals and its success will depend upon it being supplemented by coordinated efforts in other related areas. It can heighten the effectiveness of various other tools of economic policy rather than become a substitute for them. In other words, it can function as a 'fine tuner' and not as a 'prime move'.

Source: Ahmed, Viqar, and Rashid Amjad, *The Management of Pakistan's Economy, 1947–82* (Karachi: Oxford University Press, 1984), 154–5.

The first steps that the government took in this direction to encourage agricultural production was to begin to subsidize inputs, and not to raise the support or procurement price of output. During the 1960s and 1970s, an extensive structure of agricultural input subsidies was evolved which covered fertilizers, seeds, plant protection, tube wells, and agricultural machinery. Viqar Ahmed and Rashid Amjad believe that

> the objective of subsidizing inputs was to provide greater production incentives and to encourage the use of superior technology. It has been argued that while high output prices may or may not lead to greater investment in better technology, and may be diverted to higher consumption, subsidization of inputs, which comprises the new technology, would ensure its rapid adoption.[12]

The main beneficiaries of the subsidized inputs were those who most used these inputs, i.e. large farmers. As we saw in Chapter 3, the HYV technology and package were heavily biased towards the larger farmers. Hence they were the main beneficiaries, rather than the small and medium farmers who, due to numerous constraints did not make much use of modern inputs as well as water, credit, and agricultural extension services. For these reasons, some observers felt a need to 'look beyond subsidies as a policy instrument, and to pay serious attention to such matters as improving the overall supply position of the inputs . . . such as seeds, fertilizers, and pesticides and to ensure their timely availability'.[13] It was as late as 1981, when the Agricultural Prices Commission was established, that there was greater realization of the relevance of agricultural output prices.

The government introduced the concept of a minimum price support programme, which shielded the farmers from severe fluctuations in international prices and ensured a minimum return to producers. In the past, producers have received market prices well above the support price. The support price also acts as an incentive to produce more, as it is related to higher than average productivity. The National Commission on Agriculture (NCA) argued that 'the main role of the support prices is to protect the producers from a drop in the producer prices below the minimum level at which production remains profitable for good producers'.[14] However, serious problems and issues arise when there is a negative impact on farmers on account of high support prices. If world prices for food are rising, as they were after 2008, it makes sense to also increase the domestic support price, something that happened. But what does the government do if international prices fall, as they did in 2011 and 2012? It makes sense to subsidize and protect domestic farmers under such conditions, but consumers end up paying more for food which could be imported at cheaper prices on the international market. Clearly, these are politically sensitive choices and decisions are made taking into consideration the relative power of lobbies and vested interests.

A theme that will recur in this book is the major changes that have taken place in Pakistan since 1988 when the government made the first of its major agreements with the International Monetary Fund (IMF) and the World Bank. Pakistan actively followed a Structural Adjustment Programme (SAP) after 1988 under agreements with both these organizations. While an entire section of this book (Part VI) has been set aside for discussion of this theme, in the present chapter we will examine some of the issues that relate the Structural Adjustment Programme to agricultural issues, such as pricing policy and taxation (see Appendix 5.2 for a more detailed outline of the Structural Adjustment Programme).

In its 1988 report, which became the precursor to the actual Structural Adjustment Programme agreements (see Chapters 16 and 17), the World Bank's opinions regarding subsidies to the agricultural sector were expressed clearly. The World Bank stated that, 'fertilizer subsidies should be eliminated in line with government plans, wheat subsidies reduced further, and edible oil and sugar subsidies kept from reappearing'[15] (see Box 5.2 for an analysis of the problems with the wheat and fertilizer subsidies). In its evaluation of the first major Structural Adjustment Programme 1988–91, the World Bank report argued as follows:

> Over the adjustment period, Government has made progress in reducing price distortions by adjusting administered prices and in some cases liberalizing the markets in question. Output prices of agricultural commodities have generally been brought closer to farm/gate export/import parity levels, thus reducing the implicit tax on the agricultural sector. However, movement in this area has been limited and the current situation still induces a misallocation of resources in the agricultural sector. For example, farm prices for rice remain below international prices, creating disincentives to grow a crop where Pakistan has a strong comparative advantage. The same applies to wheat where domestic prices remain below import parity. Moreover, the Government did not adjust the issue price in FY92 [1991/2] despite a sharp increase in the import price. As a result, the consumer price subsidy increased sharply, reversing the progress achieved in earlier years. On the other hand, Pakistan has no comparative advantage in sugar cane. An adjustment of sugar cane support prices would induce farmers to increase yields or to shift to cotton, rice or wheat production. With regard to agricultural inputs, subsidies on pesticides, seeds and agricultural machinery have been eliminated. During the last three years, formal control over the price of nitrogenous fertilizer (urea) has been lifted and prices of phosphatic and potash fertilizers have been adjusted upwards so as to bring them closer to the (declining) international prices.[16]

Hence, on the advice of the World Bank and the International Monetary Fund, under the terms of the Structural Adjustment Programme, many subsidies were eliminated and domestic prices were freed to come at par with international prices. This practice has continued since 1988, and while some subsidies to farmers have been removed, far greater opening up of the domestic market for trade has taken place and prices have risen to encourage farmers. Procurement prices are set by government and are not 'free'. Moreover, numerous other

Box 5.2

How the Wheat and Fertilizer Subsidies Work

The World Bank has been a strong and consistent supporter of the free market and opponent of government intervention. It has advocated the removal of subsidies in almost all cases. About Pakistan it writes:

> *The wheat subsidy* in Pakistan, which dates back to independence in 1947, increased sharply in the 1980s. At its height (FY86), it reached Rs. 3.8 billion (4.2 per cent of current revenue), compared to just over Rs. 1 billion (2.1 per cent) in FY81. Following changes in the subsidy system in April 1987, the FY88 budget allocated about Rs. 3 billion for it, although the actual outcome may be higher.
>
> Under the current system the Government continues to procure wheat at a fixed price (presently Rs. 2.15 per kg) and stands ready to sell at the same price to private mills and other intermediaries as much as they require. The distribution cost and other incidentals, which are met from the government budget, currently result in a subsidy of Rs. 0.60 per kg wheat compared to Rs. 0.80 per kg prior to de-rationing; but could increase depending on the wheat harvest and the volume of procurement by the Government. The Bank recommends a phase out of this general subsidy within five years, and the substitution of a wheat subsidy limited to the needy. The present system is available to rich and poor alike, and benefits the urban population more than the rural population. Identifying the eligible population for a more targeted subsidy requires more administrative work. It could be achieved through specifically targeted compensatory programs for the poor and nutritionally vulnerable groups, such as food stamps; food distribution via health centers, clinics, schools and other welfare centers; and food-for-work schemes. At the same time, Government intervention in the wheat trade would be reduced. It would then regulate the market mainly through periodic interventions, via regulation of a strategic stock, and allow the private sector to perform the major market functions.
>
> *The fertilizer subsidy* has been an important element in the Government's policy to promote agricultural production by providing the farmer with low-cost imports. It has fluctuated between Rs. 1.5 billion and Rs. 2.5 billion a year since FY81, depending on the volume and prices of fertilizer imports, domestic production, and the Government's fertilizer price adjustments, which have usually fallen short of the increases in world fertilizer prices. In FY87, the decline in world fertilizer prices and deregulation of nitrogenous fertilizer prices in May 1986 helped reduce the subsidy to Rs. 2 billion. The FY88 estimate is Rs. 1.6 billion for phosphate and potash fertilizer subsidies, which are almost entirely imported.
>
> The Government has decided to phase out the current fertilizer subsidies through equal annual reductions of the current subsidy rate over a period of four years for phosphate (the principal type) and eight years for potash fertilizers. This is to be attained through annual price adjustments in line with international price trends; cost reduction measures in procurement, marketing, and distribution; and possible substitution of low-cost potash fertilizer imports. This programme will be supported by emphasizing farm-level adaptive research and extension services to raise the efficiency of fertilizer use. This phase-out, which the Bank endorses, is desirable for more than budgetary reasons. The fertilizer subsidy has now served its objective of educating the farmer in its use and benefits. The subsidy benefits particularly the large farmers since they have greater access to the complementary inputs. In addition, the Government's policy of deregulating agricultural output prices, combined with the setting of floor procurement prices at or above world prices, should provide appropriate incentives to agriculture without the fertilizer subsidy.

Source: World Bank, *Pakistan: Growth Through Adjustment*, Report No. 7118-PAK (Washington DC: World Bank, 1988).

constraints, such as having to sell mainly to the government, also act as a hindrance to farmers making higher profits. See Box 5.3 for why farmers prefer to sell at prices below the support price. Appendix 5.4, looks in more detail at the relation between prices and the boom in wheat production and the implications of this for farmers. Box 5.4 questions the whole notion of 'free' markets in Pakistan, given the critical role of the *arthi* and *beopari*. Box 5.5 questions the logic of raising wheat support prices, asking if this is bad economics.

5.3 Rural Financial Markets and Agricultural Credit[17]

There have been a number of studies and surveys conducted by different research institutes and by the State Bank of Pakistan which examine the nature and sources of rural credit. The main conclusions from these surveys are as follows:

> i) although there is a significant increase in the borrowing from formal sources from 1985 onwards when mark-up free loans were made available to farmers, these studies suggest that the principal source of farm credit continued to be the informal sources, especially for small farmers. A 1985 survey shows that 68 per cent of the credit to agriculture was provided by non-institutional sources while the 1972–73 survey had shown that 90 per cent of borrowing by farm households was from non-institutional sources. [Another study] demonstrate[s] from the 1985 credit survey that 85 per cent of the small farmers obtain their loan from non-institutional

Box 5.3

The Logic of Selling below Support Prices

Ali Salman explains the apparently irrational step of rice growers preferring to sell at below the government support price.

Like some other sectors in our economy, agriculture too is distorted by input subsidies and support prices. The government's interference, on pretext of powerful lobbies, reigns supreme and open market operations are absent. In this article I will discuss implications of support price for the rice crop which is currently being harvested. Instead of utilizing macroeconomic data let's take a look at a true story of a typical small grower in Punjab.

Like every year, the populist government has announced support price for rice growers. This year the erstwhile PASSCO (Pakistan Agriculture Supply and Storage Corporation) has offered Rs. 1,200 to Rs. 1,250 per 40 kg to rice growers. To find it out for myself, I made a special visit to my village in Central Punjab, where my family members, all of them small growers, had not only harvested the crop, but also encashed it. Instead of selling to their benevolent government, they decided to sell their crop to the open market through an 'exploitative' middleman. Outrageously, the open market offered them around 20 per cent less than what the government had announced, but using their free will, the growers still sold!

The following story narrates in detail why many growers decide to pick the low price of open market over high price of the government.

When the government announces support prices, it uses discriminatory methods to qualify certain growers by putting some conditions. The first condition is that the growers have to obtain a jute bag, called bar-dana, that is available only at government stores. In critical times however, as market fundamentals would predict, these bags vanish and are sold on the black market. The second problem is that even if these bags are available, they are not enough to cater to demand. Thus the growers either beg the inspectors to supply them sufficient bags or resort to agents to actually pay a commission to get these bags, which otherwise are 'free'. They are 'free' only as much as we want them to believe, otherwise they are paid by some of other taxpayers.

The second condition is that once the lucky growers, who receive sufficient quantity of bags, are ready to sell their produce, they will need to form a queue in front of government stores. They can wait and see numerous large growers, who can influence government inspectors, overtake them, and sell their produce. This process can take a couple of days. In the meanwhile the lack of adequate storage is a constant threat to his produce.

This extends his trial to yet another, third condition. The government inspector will inspect the quality of produce and is authorised to reject the lot. Once this rejection is announced, the grower, who had painstakingly arranged the jute bag and had waited for a good couple of days, has to go back. This means that he will now bear an additional transportation and storage cost. If he is lucky on his way back, he finds a 'self-interested' middleman, who offers him cash and purchases the produce, at a discount.

In the event the farmer is lucky enough to sell to the government, he won't get paid right away. The government stores do not carry cash! The farmers get a receipt and get paid in a few weeks time.

An intelligent, self-respecting, and business-savvy grower, especially small grower, which is the case with 90 per cent of our farmers, will always compare the out of pocket expense and the implied opportunity cost of resorting to the government support price. It is true that he is not literate by our standards, but he is very well educated about the economics of his livelihood. In fact, my typical farmer has already calculated an open market equivalent to support price. If the government price is Rs. 1,200, then after considering all the hassles mentioned above, the grower would be happy to sell his crop for Rs. 1,000, on ex-farm basis, against hard cash. Thus the open market keeps the prices under control and offers some respite to the struggling urban consumers.

There are several policy lessons from this true story. First, state intervention in commodity pricing, ostensibly done for welfare, is not only an economic but also political nonsense. A frustrated farmer in the presence of a support price is more belligerent than a struggling farmer in the absence of a support price. Secondly, when you curtail open markets, black markets emerge. The condition of carrying the produce in government provided jute bags should go. Thirdly, even the illiterate farmers can make rational and well-informed economic decisions, only if the all-knowing, benevolent government gets aside and vanishes.

Box 5.4

Free Markets for Agricultural Produce? The *Arthi* and the *Beopari*

The Panel of Economists set up by the Government of Pakistan in 2010 examined numerous aspects of the economy. They also looked at agriculture and agricultural pricing in Pakistan.

The Problem

Agriculture Marketing Acts govern the regulation of the purchase and sale of agricultural produce (including livestock and poultry) through the institution of market committees. A licence is required from the provincial government to establish a market within a notified area and once the notification of the market committee has been issued no other market can be established in that area without prior approval from government. The government nominates the members of the market's oversight committee and maintains significant control over the inflow of resources and assets owned by the market committee. This arrangement also results in the lack of accountability of the committee to market users and key stakeholders.

Whereas a farmer can only sell his produce through a licensed commission agent or the *arthi* (in most markets the *arthi* also acts as the commission agent), anyone can participate in the auction as a buyer, i.e. buyers do not require a license to operate in a market. The commission agent gets a commission of 5 per cent (on fruits) to 8 per cent (on vegetables) on the produce sold in the auction.

The Committees have monopolistic power and control over the bulk/wholesale purchase and sale of farmer produce in the area that is traded in these markets. This is detrimental to the interests of growers, most of whom tend to be middle farmers—with the small landowner largely resigned to selling his entire produce to the '*beopari*' (contractor/middlemen/trader) who picks it up from the farm gate or to the *arthi* in the market.[1]

Over the years, however, commodities like wheat, rice, maize, cotton, sugar cane, and oil seeds are no longer being traded in these markets and are being sold directly to processors like ginners, rice husking mills, flour mills, and sugar mills.[2] Similarly, fruits and vegetables grown are being bought directly by middlemen/trader/contractor from the farms of the small farmers[3] and brought for sale in the markets under discussion or sold directly to large wholesalers who in turn either export the produce or sell directly to large retailers. Poultry is not being traded in these markets while local governments (largely since the devolution in 2001) and private entrepreneurs in complete contravention of the law (reflecting on its poor enforcement) have set up markets for livestock.[4] In other words, only fruits and vegetables (contributing 10–13 per cent of Sindh's crop produce, valuing around Rs. 30 billion at 2006/07 prices), but making up 40–45 per cent[5] of the total production of these commodities, find their way into the government controlled markets. If livestock is included as agricultural produce that has to be traded through these markets, then in the case of Sindh the provincial government exercises control over the trade of almost Rs. 70 billion of value added in agriculture.[6]

There are too many intermediaries in the marketing chain (as illustrated in Figure I below). As explained above the *beopari*/trader and the *arthi* provide the link between the farmer (and the commission agent in some instances) and the wholesaler. The wholesaler serves as the link between the *mandi*/market and the retailer. At each step the intermediary marks up the price to factor in his profit/'cost of service' making the supply chain inefficient. It is estimated that in Sindh the wholesaler marks up the auction price at which he bought the produce by 10–15 per cent (depending upon the commodity and the supply and demand situation) when he sells to the small wholesaler or retailer,[7] who in turn, when selling to the final consumer, mark-up the produce by an overall 20–40 per cent depending upon the commodity and its quality to account for spoilage, especially of perishable items and the consumer markets in which they are sold, the more up-market the locality the higher the mark-up for quality and the cost of operations. In other words, the intermediaries pocket two-thirds to three-fourths of the price paid by the final consumer. The process of price discovery is opaque and places the grower at a disadvantage. The number of intermediaries also contributes to overall wastage—the spoilage in this lengthy chain can be as high as 40 per cent of the total supplies of the farmer. The farmer and the consumer pay for these inefficiencies.

---

1 A significant proportion of the input costs of a small farmer are financed by loans from the *arthi*/commission agent on the condition that the entire crop would be sold through him in the market.

2 However, the market committees try and collect market fees from the ginners, rice and sugar mills for the produce that they buy directly

3 It is widely believed that the small farmers have neither storage facilities nor the financial resources to transport their produce to the market. The *arthi* or the middleman/*beopari* is well positioned to exploit this weakness. Moreover, the price received by a farmer for his produce is influenced by prices for the crop in the government controlled markets which serves as a reference point for price formation.

4 However, there are no legal bars on the private sector setting up slaughter houses. Local governments are empowered to regulate the establishment and operations of these slaughter houses—essentially to ensure compliance with environmental considerations.

5 Sindh Government officials, however, challenge this claim. They argue that the volume traded through these markets is larger—in their opinion sales of 60 to 70 per cent of fruits and vegetables are transacted in these markets. Smaller quantities are being reported by market administrators simply to justify the total market fees of Rs. 70 million being accounted for officially—leakage being a major issue.

6 Assuming 25 per cent of the stock of buffaloes, cows, sheep and goats is slaughtered every year.

7 While 30 per cent of the produce is sold by the wholesaler on cash the balance is traded on a 10–15 day credit.

Solutions

There is no reason why trade in fruits and vegetables and livestock cannot be deregulated by allowing private parties to set up and operate bulk/wholesale markets and manage product-grading and standardization processes. There is, therefore, a need for an enabling policy environment for trade in agricultural produce and market access by reducing trade barriers through the creation of more competitive, non-monopolistic structures that will ensure better returns to farmers.

Introduction of greater competition at the wholesale level will not only reduce congestion in markets but also enable farmers to increase their earnings with declining opportunities for extracting rent presently available to traders who have captured these government regulated market committees that have the sole right to conduct wholesale trade in the area and also only through government-appointed commission agents.

Although the legislation governs the orderly flow of farm produce to the consumer with price discovery through the auction process the farmer, especially the small landowner, is exploited by the *arthi* and the commission agent a) because of the monopoly they enjoy since the produce can only be sold in that particular market;[8] and b) through unfair grading and weighing of the produce. An amendment in the legislation or its repeal will open up opportunities for improving the farm produce supply chain—permitting retailers to buy directly from the farmer by-passing the markets and the intermediaries. Such an arrangement will enable organized retailing (e.g. Metro type organized retailers/wholesalers) directly sourcing from the farmer, eliminating at least two intermediaries from among the *arthi*, commission agent, and the wholesaler, with the need for central storage and reliance on wholesalers also being eliminated in the process.

We estimate that the overall economies from the shortening of the supply chain—with the reduction in the number of intermediaries would be 20–25 per cent of the consumer price in the case of farm produce. These economies would be a mixed blessing with varying impact on the different stakeholders, creating winners and losers. In case of farm supplies the share of each would be a function of their relative power and the situation with respect to competition, the greater the competition the higher the benefits that would accrue to the farmer and the consumer. Farmers will get higher prices and if warehouses and cold storages are constructed, spoilage of farm produce would be reduced significantly and provide an incentive to increase farm productivity through improved technology. The wholesalers would no longer have to buy from *mandis*/markets thereby lowering their purchase costs. The procurement costs of retailers would also be lowered with margins depending upon the competition between wholesalers and retailers. While some *arthis* and commission agents would be driven out of business they could harness their unique competency about market knowledge and contacts to reorient their businesses by for example becoming wholesalers.

Our estimates suggest that just for onions, chillies, bananas, and mangoes, whose traded value in these markets at their June 2008 retail prices in Karachi was respectively Rs. 6 billion, Rs. 2.5 billion, Rs. 5 billion, and Rs. 1 billion the overall annual economic savings from the shortening of the supply chain (including reduced wastage/spoilage) could be Rs. 1.5 to Rs. 2 billion at today's consumer price in Karachi.

The reforms in the area of agriculture marketing should also aim to strengthen market related information systems. There is a need to tackle information asymmetry on prices to enable farmers to maximize their returns without being exploited by middlemen on this account. To this end, there is a need to improve the information providing network comprising websites and electronic boards in markets to make data real time.

8. Since the function of the markets is price discovery and if farmers only get a third of the retail price in government markets that sets the base for all transactions.

Box 5.5

Wheat Support Pricing or Bad Economics?

Ahmad Fraz Khan asks the question whether anyone really benefits from raising wheat prices or not.

The Economic Coordination Committee of the cabinet has increased wheat support price yet again, third time over the last four years of the present government's rule. The last week's increase has taken the price from Rs. 1,050 per 40kg to Rs. 1,200 per 40kg—a jump of 14 per cent.

Last year, the price was taken from Rs. 950 per 40kg to Rs. 1,050 per 40kg—an increase of almost 10 per cent. In 2008, when this government took over, it increased the price from Rs. 625 per 40kg to Rs. 950 per 40kg—a leap of 46 per cent.

It is not only this government. The last one, when closing in on elections in 2007, had also increased price from Rs. 425 per 40kg to Rs. 625 per 40kg. This makes a little less then 300 per cent increase in the last five years. And this is being done to a crop that is a staple for the huge majority and dictates food security situation in the country.

Once the new wheat price takes hold of the market, the 20kg of flour, which used to cost Rs. 225 in 2007, would cost well over Rs. 725—taking it out of financial reach of a few million more. The social cost of political pandering of rural voters thus becomes unbearable for the people.

By increasing price of wheat every year, the ruling elite tries to consolidate its rural vote bank, thinking that all rural people would benefit.

This is, however, a wrong assumption if Pakistan Agriculture Census is to be believed. According to it, around 85 per cent farmers don't produce marketable surplus. Thus, they are not the beneficiaries of a regular increase.

To make the assumption even skewed, around 40 per cent of rural population is landless labour that buys wheat for survival. The increase thus benefits only a small part of the rural population that produces a marketable surplus and is part of the ruling elite and decision-makers who raise wheat prices for meeting its electoral expenditures.

The stated logic behind increasing wheat support price is the escalating cost of production. This growing cost is a reality but it constitutes one of the many variables that should determine the wheat price. Import and export parity, domestic consumption, and projected requirement should also get equal weight in calculating price. But it has not been the case, as electoral politics overrides everything else.

Increasing cost of production is a reality, one created by government policies. In the last four years, fertilizer (urea) price has increased from Rs. 700 per bag to Rs. 1,700 per bag—a difference of a staggering 142 per cent. Electricity prices have gone up by 163 per cent—from Rs. 3.28 per unit to Rs. 8.63 per unit. In the same period, diesel cost grew from Rs. 73 to Rs. 111 per litre—a growth of 53 per cent. All these prices increased mainly due to government policies and it is the major beneficiary of the increase. In fertilizer price, a small role is played by weakening government writ and cartels operating in it. Here again, it is the government that should take the blame.

Because of these factors, the cost of wheat production, according to official estimates, has increased from Rs. 400 per 40K in 2006–07 to Rs. 932 per 40kg (133 per cent). The farmers' bodies, however, put it at much higher figure. The government has created a vicious circle for itself, where it increases prices of inputs to meet its own running expenditures. Then, it increases wheat prices to compensate farmers. On the third plank, it procures wheat to stabilize market. Finally, it ends up subsidizing flour for the urban population. One wonders, where this process would stop.

The cumulative cost of these four stages is hundreds of billions of rupees a year. By increasing wheat price, the government only correspondingly adds to these expenditures. This is apart from regular reports of massive corruption at these stages that have become fodder for the media.

One indicator of this rising cost is administrative cost of wheat procurement. In the last four years, Punjab, which is one of three organizations (along with Sindh Food Department and Passco) involved in procurement, had paid Rs. 80 billion in interest payments to banks on its stocks. That makes it Rs. 1.66 billion a month or Rs. 550 million a day.

In 2009–10, the Punjab procured 5.78 million tons at the cost Rs. 143 billion and paid Rs. 19 billion in mark-up to banks. Next year, it borrowed Rs. 88 billion and paid Rs. 26 billion to banks as carryover stock kept adding to the cost. In 2011–12, it borrowed Rs. 76 billion and interest payments were Rs. 23 billion. This year, it still owes Rs. 73 billion and has so far paid Rs. 11 billion.

In these four years, the Punjab alone had to borrow Rs. 381 billion for wheat procurement and paid Rs. 79.53 billion to service loans. The other two—Sindh and Passco—also procure around the same quantity and cost can easily be doubled if they are added to the tally. This is the cost of increasing wheat prices regularly and dealing with the fall out.

The federal government needs to consider two options: controlling input prices instead of increasing support and leaving price fixation to provinces. Instead of increasing support price and increasing administrative and corruption charges, the federal government should adopt fiscal and taxation policies that bring input prices down.

This would benefit the small farmers in equal measure and add to their productivity. Secondly, the federation should now leave the prices of agriculture commodities, wheat included, to provinces, which now own the sector.

It sounds strange that producers should be deprived of the right to fix price of their products. Punjab, to its credit, opposed increase in wheat prices but the federation unilaterally did the deed, creating a situation for provinces where they have no option but to follow the price or risk alienating voters. This is certainly bad economics.

sources compared to 40 per cent in the large farmers category;

ii) a significant proportion of loans (over 30 per cent) disbursed by institutional sources are either proxy loans or roll over funds.[18]

A 1995 World Bank study examining the extent and degree of rural finance in Pakistan reached the following conclusions:

1. Credit does play an important role in agricultural productivity and output.
2. Rural credit reaches few rural households, and institutional sources provide credit to only a small proportion of rural households. Only 32 per cent of all rural households take loans, and of these a mere 10 per cent borrow from institutional sources. The main sources of institutional credit are: Agricultural Development Bank of Pakistan (ADBP) which is now called the Zarai Taraqiati Bank Limited (ZTBL) 76 per cent, commercial banks 17 per cent, and co-operative societies 6 per cent. 90 per cent of the households take loans from informal sources, mainly friends and relatives (67 per cent) and landlords (11 per cent). Not surprisingly, non-institutional or informal sources of credit dominate the rural sector.
3. Both sources of credit tend to be short term, but serve different needs. For example, 94 per cent of institutional or formal credit is meant for production and investment, while most (47 per cent) non-institutional credit is used for consumption purposes.
4. Not surprisingly, there is an inverse correlation between wealth and access to sources of credit. Richer households in the rural areas have better access to institutional sources, which are also cheaper, while poor households depend primarily on more expensive, non-institutional credit (see Table 5.8).
5. The access by poorer households to institutional sources of credit is constrained by complex procedures, and informal sources are much simpler and more flexible, often requiring little collateral. As much as 76 per cent of formal institutional credit was against the security of landed property and 21 per cent against personal surety. For informal sources of credit, as much as 96 per cent of loans were advanced on personal surety. This may help explain why there is differentiation between institutional/non-institutional credit based on size of farm, and by ownership pattern. One would expect smaller farmers to access informal sources of loans more easily and frequently than larger farms, which would have better access to institutional sources. Moreover, owners would take out greater loans than tenants from either source (see Table 5.9).[19]

Recent studies have shown that little has changed some years on. In May 2009, a large survey and study was published by a number of institutions known as the 'Access to Finance Study'.[20] While some of the findings and features of this Report are presented in Chapter 14 on Banking, here we summarize some of the findings related to rural financial markets.[21]

1. Only 14 per cent of all Pakistanis, rural and urban, use a financial product or service of a formal financial institution, which includes savings, credit, insurance, and remittance services. However, around 50 per cent of all Pakistanis have access to some sort of financial service, whether from the formal sector or from the informal unorganized or informal organized sector. The organized informal sector comprises of committeees/*bisees*, shopkeepers, moneylenders, hawala (informal system of transfering money)/hundi (money remitted by a negotiable instrument) money transfers, and such like. The unorganized informal sector comprises of friends and relatives. Half of the population is excluded from any form of financial service, whether formal or informal. Compared with only 14 per cent of Pakistanis who are part of the formal financial sector, the figure for Bangladesh is 32 per cent, and 48 per cent in India, and as high as 59 per cent in Sri Lanka. Clearly, financial inclusion in the formal sector is very low compared to other countries in South Asia.
2. Rural areas account for only 10 per cent of the total bank deposits in Pakistan by value, and only 7 per cent of the total value of deposits and advances from banks. Only 15 per cent of farmers are reached by the financial system as a whole, including commercial banks, agricultural banks, and other financial institutions.
3. There is a very large imbalance in access to formal finance which favours large farmers. The upper-income large farmers have access to ten times the access to formal finance compared to the lowest quintile of farmers. This imbalance is also replicated in terms of informal sources of finance.
4. Since the formal sector is small and a large number of Pakistanis borrow, most, even in the rural sector, borrow from informal sources, such as family and friends and shopkeepers. Also, as Box 5.4 shows, many farmers also borrow from the middlemen in the chain of delivery and market. Most of those who borrow in Pakistan, do so for consumption smoothing purposes, such as household needs and marriages or funeral expenses. Nearly half of the households borrowed from friends and family, with around half borrowing from shopkeepers. Not surprisingly, nearly 98 per cent of the rural population, has never taken a formal bank loan.

The studies cited above confirm the view that irrespective of income levels, the rural population rarely uses formal financial services. Numerous reasons account for this, and include the absence of formal financial services close by, the paperwork, involved in setting up such accounts—it takes twice as long in Pakistan to open an account as it does in the rest of South Asia, and one presumes that in rural Pakistan, this might be longer still.[22]

5.3.1 Informal Sources of Credit

A study in the Punjab has shown that only 15 per cent of the small farmers had access to institutional credit, while a 1986 study in Sindh suggested that only 8 per cent of farmers had this source of credit available.[23] There were also numerous problems related to the availability of this meagre amount of credit. The need for credit at a particular time, like other inputs, can have a critical influence on whether a crop will succeed or fail. Studies have found that a disproportionate number of farmers (69 per cent in one study)[24] were given credit well after the deadlines had expired.

Although Table 5.10 shows the quantum jumps made in the amount of credit available to farmers through institutional sources, there is a very noticeable preference amongst users for credit from non-institutional or informal sources. The

reasons given for this include easier access, absence of cumbersome procedures, availability as and when required, the availability of credit even for consumption purposes or emergency loans, unlike official sources which have rather restricted uses of credit, the possibility of a deferred repayment of debt if crops fail, and often the availability of credit through informal sources without the need for any collateral.

A major complaint heard from farmers pertains to the high transaction costs that borrowers are forced to pay in order to acquire a loan. Transaction costs are said to comprise various components, including 'application fees, form-filling fees, loan registration fees, borrower's travelling expenses, costs of entertaining people who assist the farmer in getting the loan, and the opportunity cost of the borrower's time in negotiating the loan'.[25] In comparison, such non-mark-up costs are almost negligible when credit is borrowed from informal sources. Since many farmers feel that the difference in the total cost of borrowing from both sources is almost negligible, farmers prefer to acquire credit from informal, non-institutional sources.

Official government figures in the 1970s revealed that as much as 80 per cent of rural credit was supplied by informal leaders, but with the huge increase in formal credit, the expansion of bank services and greater monetization, there was a fall in this proportion to about 55 per cent by the early 1980s.[26] Box 5.6 contains the arguments for and against informal loan markets.

There is a belief that moneylenders in the informal market charge 'usurious' rates of return, but it has been observed in Pakistan that they are a disappearing breed; the main actors in informal rural financial markets are now the commission agents or arthis, and increasingly, shopkeepers, as consumer goods expand into rural areas. One needs to examine how the rate of return is determined in informal lending and to what extent this rate differs from the formal sector. Amongst the mechanisms that determine this return is the

> most obvious and visible mechanism [which] is the statutorily fixed commission on the marketed value of output. However, a large component of the return may consist of less visible mechanisms like manipulation of output purchase and input supply prices, biases in weighing of output, charging of fictitious costs, payments in instalments, etc. The issue is the extent to which reliance is placed on market imperfections and extortionary mechanisms to charge effectively high rates of return from borrowers.[27]

As Viqar Ahmed and Rashid Amjad argue, 'the very fact that a large number of farmers prefer to borrow from informal

Box 5.6

Are Informal Financial Markets Always Exploitative?

Different views exist about the nature of informal financial markets. Some are summarized here:

i) According to one view, informal lending is inherently 'exploitative' in character, with 'usurious' rates of return being charged from small farmers who find themselves in a state of perpetual indebtedness. In this view the informal credit market is fragmented, imperfect, and characterized by local monopolies. Consequently, rates of return are high, ranging from 30 per cent to 50 per cent. Various mechanisms exist for extracting a high rate of return on loans which include lower prices for output marketed to the lender (commission agent), higher prices for inputs, biased weighing of output, charging of fictitious costs, etc. Consistent with this view of informal lending is the policy prescription that institutional finance is essential to get the small farmer out of the clutches of these exploitative arrangements.

ii) Various authors have also highlighted the constraints of informal lending which have inhibited its growth. They have indicated that resources and activities of informal lenders are inadequate and ill-suited for modernization. This is largely due to their inability to lend for long enough periods for farmers to acquire productive assets. Hence, the growth of informal lenders has been slow. Another failure has been the lack of mobilization of financial deposits because deposit facilities are inadequate, unsafe, untrustworthy, or less remunerative.

iii) The other sharply contrasting view of informal lenders was first articulated by Michael Lipton. He argued that there should be greater reliance on informal sources which do indeed get to poor farmers, albeit at high rates of return. As opposed to this, concessionary institutional finance is largely siphoned off by large farmers. Also, informal lending has a number of inherent advantages. It is potentially more efficient, decentralized, and accessible, loans can be obtained on time, and scope exists for receiving consumption loans for financing emergency needs along with production loans. It has been shown that the difference between costs of borrowing from formal and informal sources is greatly diminished if transaction costs are included. . . . In Bangladesh effective costs [mark-up + borrower transaction costs] of small loans from informal sources are, in fact, lower than those from financial institutions. If informal lending is seen as performing a useful function, especially for small farmers, in a competitive environment then the policy stance would have to change towards greater integration of the rural financial markets with more role being assigned to informal lending.

sources in spite of the high cost shows that the demand for agricultural credit is highly service elastic, a significant factor which is overlooked'.[28] Despite increasing modernization and monetization, and growing urbanization, as well as the closer proximity of farmers to markets, one will continue to see the dominance of the informal sector in rural, as well as urban, areas. The middleman, the *arthi*, the *bisee*, or the family as a source of credit, is unlikely to be replaced for many years to come.

5.3.2 Formal Sources of Credit

Formal rural financial institutions are of different types and include government departments and corporations, co-operatives, commercial banks, and specific agriculture-related development banks (see Figure 5.5 for the changes in sources of formal credit in agriculture). Specialized financial institutions in the rural areas, such as the Zarai Taraqiati Bank Limited (ZTBL) formerly the Agricultural Development Bank of Pakistan (ADBP), may be involved in the disbursement of medium- and long-term credit. The five commercial banks in Pakistan have increasingly increased their proportion of agricultural credit and now dominate credit disbursement in the agricultural sector. However, formal sources of credit are still very limited all across Pakistan, and especially in the rural areas.

In a study conducted by International Food Policy Research Institute (IFPRI)[29] it was observed that, in the case of formal sources, the success of a scheme requires proper financial intermediation to disburse credit of the right kind at the right time, along with specialized and decentralized management structures. The study found that 'supervised credit and development of access to inputs and marketing facilities have been the major responses to tackle the problem of efficient targeting, disbursement and recovery of credit'.[30] In the case of Pakistan it has been seen that the 'development of supervised credit operations by commercial banks has been constrained by the need to limit costs of lending'.[31] In the study conducted by the Applied Economics Research Centre based on field work in the different areas of Pakistan, four major issues concerning formal rural financial institutions were found to be critical. These were as follows:

a) Targeting of Credit: A major problem with lending practices by branches is the substantial diversion of credit away from the intended beneficiaries (small farmers). In particular, a high proportion of proxy loaning exists in the case of personal sureties type of collateral. An earlier study has also highlighted this problem. Given this misallocation, there may be a stronger case for bringing rates of return on agricultural loans closer to market rates in order to remove incentives for arbitrage by large landowners and the resulting adverse consequences on equity.

b) Problems of Regulatory Policies: The presence of mandatory targets for agricultural lending and the linkage between establishment of urban and rural branches has greatly reduced the emphasis on profitability of rural banking. This has increased the orientation towards loan disbursement and permitted suboptimal location of branches. However, it appears that, in the face of high default rates, commercial banks are beginning to opt for a policy of paying penalties rather than achieve lending targets.

c) Diversification of Lending Instruments: Most banks have experimented with new types of lending instruments, including Islamic modes of financing like *musharaka*, mark-up, hire purchase, buy back finance, etc. Mark-up free loans have also been disbursed to small farmers. This has probably had a positive impact on the demand for credit as varying preferences of borrowers have been more effectively catered for. However, the mark-up system may have created a greater incentive for default, as the penalty in the event of non-repayment of a loan is linked only to the amount of outstanding principal.

d) Lack of Decentralization: High rates of default appear to have created a centralization tendency in terms of loaning powers. Increasingly, branch managers and mobile credit officers (MCO) of commercial banks are being required to refer loan applications, of even relatively small amounts, to zonal offices for approval. This is affecting the speedy and timely disbursement of loans. In addition, growing risk aversion on the part of RFIs has led to institution of more elaborate documentation requirements. This has increased borrower transaction costs and contributed to delays.[32]

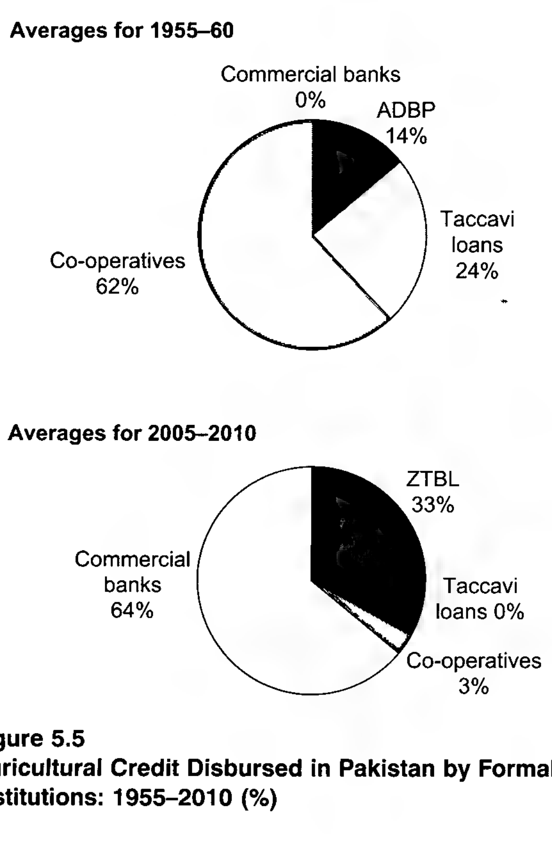

Figure 5.5
Agricultural Credit Disbursed in Pakistan by Formal Institutions: 1955–2010 (%)

The Extent of Debt

A study in the early 1960s found that 45 per cent of the cultivators in Pakistan were in debt and received an average annual cash loan of Rs. 598. The loans were utilized mostly for household expenditure (45 per cent) and livestock (36 per cent). More productive activities, such as land development and storage facilities, received a very small share.[33] The 1972 Pakistan Census of Agriculture quoted a figure of 43 per cent for the total proportion of agricultural households that were in debt. While the distribution of households in debt by size of holding showed little variation, the households with 150 acres or more were relatively more indebted: 50 per cent of households in this category were in debt compared with around 43 per cent for all other households. Of the three categories, owner households, owner-cum-tenant households and tenant households, the last named were the most indebted, while owner households were the least indebted: only 39 per cent of all owner households were in debt, while 49 per cent of tenant households were in debt. In all three categories, households above 150 acres were more indebted than smaller households.[34]

It is very interesting to observe that there was a major change by the time of the 1980 Census of Agriculture. Only 21 per cent of farm households (less than half the proportion in 1972) were in debt. Nevertheless, the pattern regarding type of household and size of landholding was similar to that for 1972. An interesting figure provided in the 1980 Census concerned the distribution of debt in terms of institutional and non-institutional (informal) sources, which stood at 32 per cent and 68 per cent, respectively. For smaller households, not surprisingly, informal sources provided much more credit than formal sources: 90 per cent of the credit for households under 5 acres came from informal sources. Compared to this, 60 per cent of the credit for households above 50 acres came from institutional sources. Owner households had 38 per cent of their credit supplied by institutional sources, while tenant households had only 8 per cent supplied from this source.[35] Clearly, access to agricultural credit from formal or informal sources was divided by type of household and by ownership patterns, with smaller households (in area) and tenant farms making greater use of informal sources, and large farms and owner-farms using formal institutional sources.

According to the 2010 Census of Agriculture, 10 per cent of all households were in debt, with 13 per cent agricultural households and 13 per cent of farm households in debt. Perhaps it is not surprising, that the smallest farm households, those who own less than one acre of land, are the least in debt (only 6 per cent of households in this segment), and a larger proportion of owners were in debt as landholdings increase. Hence, 13 per cent of households in the 2.5–5 acre segment were in debt, which rose to 21 per cent of households in the 12.5–25 acres segment, rising further to 27 per cent in both, the 50–100 and 22 per cent 100–150 acre segments. Table 5.11 shows the extent of debt by the nature of holding, as well by the time of arrangement of tenure, while Table 5.12, shows the amount of debt incurred, from both, formal sector institutions as well as informal sector intermediaries.

Bank Credit to Agriculture

ZTBL used to be the largest source of institutionalized credit in the agricultural sector, on average providing more than 64 per cent of total credit between 1995 and 2000 (Table 5.10). Commercial banks did not make any loans to agriculture prior to 1972 when they were nationalized, and at best provided loans for trade in agricultural products. In the 1995–2000 period they constituted about 20 per cent of loans in the formal sector (Table 5.10). However, all that has changed, and now the five commercial banks provide more than half of the loans from the formal financial institutions to the agricultural sector, a figure which is much smaller than what farmers, particularly small farmers, borrow from non-formal sources—see Box 5.7 for different types of loans.

Box 5.7

Different Types of Loans

The distinction between different types of loans of variable duration is important. Some salient features are as follows:

> Rural credit is usually classified as short-term (up to one year), medium-term (one to five years), and long-term (exceeding five years). Short-term loans are needed for meeting annual production costs (for example, seeds, pesticides, fertilizers), and for the replacement of a portion of the farmer's fixed capital (for example bullocks, sheds, implements, and the cost of consumption needs up to harvesting). Thus these loans can be treated as part of the working capital requirements. Medium-term loans are needed for the purchase of livestock, implements, the construction/improvement of water courses, and for equipment not expected to last more than five years.
>
> Long-term loans are needed for improvements of a more lasting character like the sinking of wells and tube wells, the purchase of additional land, or for repayment of old debts.
>
> Loans can also be categorized into productive loans and unproductive loans. According to the conventional definition, a productive loan is a loan which is utilized in such a way that it leads directly to an increase in the income of the farmer and adds to his capacity to repay. These loans may finance current production, i.e. meeting current cultivation costs and future development, i.e. increasing future returns. Unproductive loans are those which do not directly increase the efficiency of cultivation or the farmers' income. But . . . it is sometimes difficult to separate productive loans from unproductive loans.

5.4 MECHANIZATION

When we talk about mechanization in agriculture, it is essentially tractorization which comes to mind, and other implements are often of a secondary nature. The reason for this synonymity is the huge impact of tractorization on output, employment, the nature of social relations of production, and so on. In our analysis of the Green Revolution we saw how the HYV package was supplemented by tractorization and how these tractors had an impact on the agricultural process, changing agricultural production for ever. In this section we will discuss the effects and issues around tractorization/mechanization, and add some discussion of the use of tube wells and how this process of mechanization in the area of irrigation has affected agriculture over the years. One must add, however, that the discussion on mechanization is much outdated now, for much of Pakistani agriculture is already mechanized and debates around the consequences of mechanization no longer create controversy or take place. Much of the discussion in this section gives a view of the historical debates around and against mechanization rather than regarding current issues.

The importance of mechanization can be judged by the attitude of the various governments of Pakistan in the early years. The Report of the National Commission on Agriculture evaluates the attitude of the government in the early years as follows:

> Mechanization in Pakistan had a late start and slow initial progress because of the Government policy of restricting mechanization based on the apprehension that it would displace farm labour and cause the problem of unemployment. Even the international agencies like the FAO and the World Bank advocated caution and recommended that small farmers should not be encouraged to purchase tractors. *In retrospect, it is now clear that it was a misguided concern.* Mechanization, to the extent it has taken place, has resulted in increased farm incomes and manpower productivity and the employment effect has, on the whole, been positive. Total employment in agriculture increased from 9.8 million in 1965 to 14.6 million in 1986. The value added per farm worker also went up from Rs. 946 in 1960 to Rs. 1,357 in 1985 (constant 1959–60 prices). However, the most important development *was the generation of increased farm related off-farm employment in manufacture,* the supply and servicing of agricultural machinery, the supply of other inputs and the post harvest handling of increased agricultural production.[36]

Despite the early bias and recommendations against tractorization, there has been an astronomical increase in the number of tractors available in the country. In 1960 there were only 1,665 tractors on farms in Pakistan. In 1968 this went up to 16,583, and it had doubled again by 1975. The number of tractors increased by 400 per cent between 1975 and 1984, and in 1986, there were reported to be 187,255 tractors on farms in Pakistan.[37] In the years since then, it would be fair to speculate that the number for 1986 has increased further by large amounts. Thus, tractors have become a major ingredient in agricultural production in Pakistan. Unfortunately, even recently published government publications have rather old data. For example, Table 5.13 gives data for as long ago as 1994. However, we have recent data which shows that annual tractor production in 2001/2 of 35,038, was twice what it was throughout the 1990–98 period; in the late 1980s, the average annual production was over 22,000, which supports the claim that mechanization and tractorization has increased substantially.

An important feature of the tractorization process in Pakistan has been that most of the tractors available have been of the larger type. Table 5.14 shows that 80 per cent of tractors were in the 46–55 horsepower range, with 17 per cent in the 56–65 horsepower range. Also, the ownership of tractors (Table 5.13) is concentrated, not surprisingly, in the middle range of farm sizes. These are the dynamic capitalist farmers who played an important role in the Green Revolution. One consequence of the policies regarding tractor size and ownership, as pointed out by Mahmood Hasan Khan, was that tractor ownership 'gradually increased the size of landholdings, through both an increase in the land leased from the poor and middle peasants and cultivation by the landlords themselves at the expense of sharecroppers'.[38]

Table 5.13
Farms Reporting Use of Important Agricultural Machinery (by Size of Farms)

Farm Size (acres)	All farms	Tractors		Tube Wells/Pumps	
		Owned	Rented	Owned	Rented
All sizes	4,449 100%	285 100%	3,288 100%	479 100%	1,422 100%
Under 5.0	2,097 47%	31 11%	1,617 49%	113 24%	745 52%
5.0–12.5	1,521 34%	82 29%	1,151 35%	181 38%	485 34%
12.5–25.0	553 12%	77 27%	375 11%	101 21%	144 10%
25.0–50.0	198 4%	57 20%	112 3%	54 11%	38 3%
50.0–150.0	69 2%	31 11%	30 1%	25 5%	9 1%

Just as there was a bias against tractorization in general, there have also been official recommendations in the past against providing tractors to small and medium farmers. The issue here was one of cost, since the government realized that these farmers would not be able to buy the imported tractors unless they were heavily subsidized. However, since the early 1980s, the small and medium farmers have bought tractors, many of them using loans, but more recently, a large number have probably financed their tractors from remittances from the Middle East. Since the tractors available have been of the larger variety, these small and medium farmers have had excess capacity on hand. They have made

> profitable use of the tractors by hiring out the excess capacity to do custom work for other farmers, by participating in the earth moving operations in construction of rural roads, by using the tractor to operate stationary threshers, chaff cutters, cane crushers, and other specialized equipment and, above all, by the tractor drawn trolley for haulage of goods from villages to markets and agricultural inputs and non-farm requisites from towns to villages. The use of tractor for haulage is perhaps the predominant feature of the utilization of tractors owned by the small and the medium farmers.[39]

Despite the ownership of the tractors by small and medium farm owners, as Table 5.13 shows, a much larger number of farmers in this category rent in tractors. This is also supported by the evidence that farmers have given up the more traditional bullocks at a rate higher than the rate of acquisition of tractors, implying that these farmers

Should there be Mechanization in Agriculture?

Arguments for and against farm mechanization are raised by Viqar Ahmed and Rashid Amjad in their book *The Management of Pakistan's Economy, 1947–82*.

Against

1. Farm mechanization is basically capital-intensive. This has so far thrived in developing countries on the basis of direct subsidies and subsidized credit since scarcity of capital is not reflected in its price.
2. Mechanization of farming will divert capital and foreign exchange from non-agricultural sectors to agriculture where labour-intensive alternatives are available.
3. The argument that mechanization increases the productivity of land (except through multiple cropping) has not been conclusively proved.
4. Mechanization not only displaces labour but also induces landlords to cultivate land through hired hands, hence the social cost in terms of tenants converting into landless labourers.
5. Farm technology has a big-farmer bias and accentuates social disparity particularly in the case of assets having lumpy investments.

For

1. Mechanization encourages multiple cropping and greater intensity of cultivation and is thus land-saving.
2. It reduces the dependence upon draught animals whose number is not increasing as fast as the availability of water. One reason why the cropped area has not increased in proportion to the water supply is the inadequacy of farm power. Mechanization will free land from growing fodder for draught animals.
3. Mechanization will make dry-farming possible and will in this way counterbalance the regional bias of the package of modern inputs in favour of irrigated areas.
4. The new package of modern inputs and greater water supply can attain their highest potential yield only with the help of mechanization.
5. Mechanization lowers the cost of production by allowing more efficient utilization of land, labour, irrigation, and other inputs.

Source: Ahmed, Viqar and Rashid Amjad, *The Management of Pakistan's Economy, 1947–82* (Karachi: Oxford University Press, 1984), 159–60.

hire tractors from other owners. Unfortunately, the data available even in the latest *Agricultural Statistics of Pakistan* is completely outdated, and anecdotal and visual evidence suggests that the process of mechanization has gathered considerable pace and grown exponentially. Moreover, in Chapter 1, the Introduction to this book, and many of the later chapters have also argued, the process of modernization, of which mechanization is a part, has continued actively and aggressively over the last few decades, changing social and economic relations irreversibly.

Box 5.8 summarizes the main arguments which used to be made in the past for and against tractor/mechanization use. One study undertaken in 1982 in Pakistan[40] based on field surveys came up with the following findings:

1. Tractors were used mainly for land preparation.
2. Income of farmers, measured as the gross value of output per acre, *was not significantly different between tractor and non-tractor farms*.
3. The average yield levels of major crops *were not different on tractor and non-tractor farms*.
4. Cropping intensity was significantly higher on tractor farms.
5. Labour productivity was higher on tractor farms.
6. There was considerable displacement of animal labour by tractors.
7. While the use of labour falls on tractor farms, the outcome is not as severe as often suspected. However, family labour is higher on non-tractor farms and also falls as farm size increases.

Overall, it seems that tractorization does not directly result in displacement of labour on the scale suspected, and nor are yields impressively enhanced. However, Viqar Ahmed and Rashid Amjad cite a number of studies which showed that output did increase, quite dramatically. One study shows an increase of 20 per cent, another shows that maize and wheat increased by 30 per cent, and they quote yet another study by the World Bank (although conducted in 1969) that there is an increase of between 140 and 200 per cent in cropping intensity on irrigated farms due to mechanization in the Punjab.[41] Nevertheless, the *nature* of labour changes as a result of tractorization. If farm labour, and especially tenants, are displaced, they are often replaced by the short-term wage workers, which sometimes causes a problem of shortages at peak times. Tractorization also implies the resumption of previously unused land, or land let out to subsistence farmers, often displacing them. But the issue of tractorization, and especially mechanization, cannot be looked at in isolation. Numerous externalities need to be considered.

Once tractorization and mechanization commence, they give rise to numerous ancillary activities. A process of small-town urbanization begins, and technicians and skilled workers related to mechanization are created. Off-farm activities increase, and other avenues away from agriculture are opened up for employment purposes. Traditional methods, values and traditions are confronted by inventions of the new age, and the slumber of old habits and times is broken. In essence, mechanization is a dynamic process that affects institutions and economic and social relations, and transforms entire regions. These impacts must not be underestimated

for they can overwhelm societies. Many of these changes are irreversible: some presumed to be detrimental, others considered to be progressive. Nevertheless, the question is not *whether* technology in agriculture and elsewhere ought to be used, but *how*, and to whose benefit.

5.5 Agricultural Income Tax

The debate over whether agriculture should be taxed is an important one, and many reasons are given for and against imposing taxes on agriculture (see Box 5.9 and Appendix 5.5). As much as taxation is an economic issue, where the government is concerned about increasing its revenue and dealing with the budget deficit (see Chapters 10, 11, 16 and 17), it is also a political issue, where some political lobbies have resisted, while others have demanded such a tax. The politics of taxation of the agricultural issue is reflected not only in parliament and government, but also in reports and commissions set up to study the issues. The 1988 report of the National Commission on Agriculture (NCA) is one such example.

The report of the NCA is one of the better and more comprehensive documents produced by the Government of Pakistan. Indeed, the present chapter has drawn a great many of its arguments from this source. However, the true colours of the Commission come through when it discusses the issue of agricultural taxation. The following, somewhat lengthy, excerpt from the report shows how the Commission floundered on an extremely important issue.

> A section of the business and industrial community has been pressing that there are excessive agricultural incomes that must be taxed [sic]. Their contention regarding the sector as a whole is unfounded as most of the agricultural holdings are too small to generate taxable surpluses of income. Even for the relatively large holdings there is no assurance of sustained incomes. Agriculture by nature is a risky business and incomes can fluctuate from negative returns in some years to very good incomes in others. Extreme dependence on natural factors creates a high degree of uncertainty for the final output which is not even insurable with insurance firms. A farmer can, for instance, lose all or most of his harvest due to some natural catastrophe and he may lose not only that year's income but also some of his capital like the livestock. The farmer acts as his own insurer in the absence of the commercial insurance facilities. In good years he pays his accumulated debts and then, if possible, generates some savings to supplement his capital stock to make up for losses in bad years. The replenishment and the building up of farm capital is an essential condition for sustained growth in agricultural production. Unlike industrial establishments with easy access to multiple sources of credit, the farmer has to finance capital replacement and additions largely from his own savings. If these savings are skimmed off, the farms gradually lose their capacity to produce and the whole country suffers.
>
> . . . Although the incidence of direct taxes on agriculture is small relative to other sectors, the total proportion of income transfers out of agriculture is quite high. *There is no scope for further taxation of the sector without adverse impact on the sector's productive capacity. In the face of this situation the demand that agricultural incomes should be taxed as personal incomes in line with other income earners in the country must be rejected as counter productive.* However there are certain inadequacies and inequities in the present system which must be removed.[42]

In an earlier official report, the National Taxation Reforms Commission (NTRC) in 1986 evaluated the possibilities of imposing a tax on agriculture. Although there were some disagreements about how, and if, further taxes should be imposed, the members of the Commission on their analysis of the existing situation argued as follows:

> Although a vast majority of people engaged in agriculture are living below subsistence level, yet a number of persons in this sector are enjoying better incomes. This has been mainly due to two reasons. A number of bigger landowners managed to save their lands from the two land reforms by various devices and secondly, many agriculturists have set up orchards, fruit gardens, vegetable and horticultural estates, etc. on their lands which yield higher incomes. The Green Revolution and mechanized farming have also increased the income of a large number of agriculturists. There is now a class of landowners who reside in urban centres and have made substantial investments in real estate in the cities. Since they pay no income tax at all, they have created jealousies among the trading and industrial classes as well as the professional and the salaried class who have to pay income tax. This is why demands for levy of income tax on agricultural income keep constantly pouring from various trade associations and chambers of commerce and industry. Persons in the professions have also voiced their protests in the press against exemption to agricultural income. It has been stated that the existence of an exempted class among the taxpayers discourages tax compliance and provides strong incentive for tax evasion amongst businessmen and professional income tax payers.
>
> Many traders and industrialists have purchased agricultural lands with the intent to whiten untaxed black income from business by showing it as agricultural income. Also many businessmen have entered into collusive arrangements with land owners; they obtain fictitious leases of lands from which they show enormous amounts of agricultural income which, in fact, is their business income and thus escape income tax.[43]

Box 5.9

The Issue of Agricultural Taxation

Should agriculture be taxed? There are a number of arguments presented for and against a tax on agriculture, and Viqar Ahmed and Rashid Amjad summarize some of the main issues.

Arguments against income tax on agriculture

1. It would be inconvenient to both the tax-collectors and taxpayers since farming in Pakistan is generally of the subsistence type and not of the commercial type. Farmers do not maintain standardized accounts of their costs and returns and, therefore, it is difficult to assess their net incomes.
2. The number of farmers is very large and they are scattered all over the country, many in remote inaccessible areas. It would cause considerable loss of time and money to even contact the potential taxpayers.
3. Agricultural incomes being uncertain, depending upon the vagaries of nature, it is quite probable that a large number of farmers may frequently move across the tax exemption limit, thus making it difficult and laborious for tax authorities to keep tabs on them.

Arguments in favour of income tax on agriculture

1. It is unfair and illogical to make a distinction between agricultural and non-agricultural incomes for purposes of taxation. Just as incomes below a certain level are exempted from tax in case of non-agricultural incomes, the same principle should be extended to agricultural income. This would take care of the large majority of subsistence farmers who would be automatically excluded.
2. There is considerable evasion of income tax by those having both agricultural and non-agricultural incomes. Part of their non-agricultural income is shown by them as accruing from agriculture, thus evading the tax. Extending income tax to agriculture would reduce tax evasion.
3. Agricultural income tax would be more income-elastic than land revenue. With a greater yield per acre, higher procurement prices and mechanization, the benefits of which are mainly confined to large farmers, incomes in the agricultural sector have risen considerably but yield, in terms of direct taxes from agriculture, has not risen so fast. Between 1972–3 and 1978–9, the yield from direct taxation on agriculture (land revenue and irrigation charges) increased by 78 per cent (from Rs. 472 million to Rs. 762 million) while value-added in agriculture at current factor cost increased by 157 per cent (Rs. 21,907 million to Rs. 56,370 million).

Is agriculture already over-taxed?

1. Agriculture is subject to a large number of direct, indirect, and hidden taxes. Indirect taxes constitute over 85 per cent of the total revenues of the federal government. Since these taxes are paid by all, it can be safely assumed that the agricultural population (being about three-fourths of the total population) bears a heavy burden. There are also hidden taxes in the form of low procurement prices paid by the government for many agricultural products, export duties on agricultural commodities, and the mechanism of terms of trade between industry and agriculture.
2. Increase in agricultural incomes has been offset by a rise in population and higher expenditure on agricultural inputs and equipment.
3. Higher taxation on agriculture will adversely affect the motivation for savings and investments at a time when farmers must make larger investments in order to increase productivity.
4. Agricultural income has increased not only due to higher income per acre but also due to the increase in area under cultivation. Higher taxation will discourage farmers from bringing new land under the plough.

Further capacity for agricultural taxation

1. Direct taxes on agriculture have risen at a slower pace than growth in agricultural incomes.

   But the introduction of subsidies to agricultural producers on inputs and to urban consumers on wheat, edible oil, and sugar provides further complications. Subsidy is a 'negative tax' and should be taken into account while calculating relative tax burdens. Gotsch and Brown have attempted the calculation of subsidy transfers between the agricultural producers, the urban consumers, and the government (which includes both the federal and provincial governments).

   The data supports the view that the rural sector has (a) received much less subsidy from the government than the urban sector, and (b) contributed a substantial share to the consumer subsidies. However, these figures do not show the full effect of the subsidy transfer due to, apart from other reasons, the fact that Gotsch and Brown did not include in their calculations such implicit subsidies to agriculture as canal water, power supply, institutional credit, and the benefits of extension services.
2. Any comparison of an aggregate tax burden on agriculture with another sector will have little meaning in terms of equity unless a large number of variables are considered and given due weightage. However, a simple comparison between direct taxes on agricultural and non-agricultural incomes will be instructive.
3. The population argument is weak because the urban population has increased even faster than the rural population due to both natural factors and migration from the rural sector.
4. The major benefits of a rise in incomes due to higher yield in agriculture went to larger farmers. This has intensified inequities in income distribution in the rural sector and would indicate additional taxable capacity.
5. The rise in incomes has not been accompanied by any corresponding increase in the level of domestic savings which has remained low. The failure of the government to expropriate this surplus has resulted in a considerable increase in consumption expenditure of the rich farmers. According to Alavi, even when there are adverse changes in terms of trade (for agriculture) the rural élite enjoy considerably enhanced real incomes.

Source: Ahmed, Viqar and Rashid Amjad, *The Management of Pakistan's Economy 1947–82* (Karachi: Oxford University Press, 1984), 156–7.

One argument that has been raised against imposing any further taxes on agriculture is that the agricultural sector bears the heaviest burden of indirect taxes, which according to the NTRC were 42 per cent of all indirect taxes at a time when contribution by agriculture to GDP was only 26 per cent.[44] The NTRC report also cited figures which showed that as much as 20 per cent of the net income of the agricultural sector would be transferred out in 1986/7 through taxes, subsidies, and price transfers—equivalent to Rs. 30 billion, which in that year was more than three times the total collection of income tax.[45]

Anjum Nasim and Asya Akhlaque examined the need for an agricultural tax and say that it is justified on 'grounds of horizontal equity (individuals in equal economic position should be taxed equally)', and also due to the practical compulsions that ensue.[46] Exempting agricultural income usually has a disincentive effect on those who pay tax, and raises the 'possibility of evasion and fraud by attributing incomes from non-agricultural sources as agricultural incomes or by passing-off unexplained loans as loans from agriculturalists'.[47]

Those who support the proposal of imposing agricultural income tax show that while the amount of indirect taxes paid by the agricultural sector in 1986 was higher than other sectors, the bulk of this taxation was borne by the low-income groups and poorer farmers.[48] This view supports the claim that indirect taxes are highly regressive and inequitable. An argument that the anti-taxation lobby continues to propound is that the agricultural sector is in bad economic shape as a whole, and thus should not have taxes imposed on it. The pro-tax lobby argues that despite this poor shape, a number of individuals do earn very large incomes and there are no grounds for allowing them to go scot-free. Taxes are imposed on personal income and not on the sector as a whole. Moreover, other sectors of the economy are often also 'in bad economic shape', but must be accountable to the exchequer for any profit, or even production, that they undertake. Hence the argument that agricultural income should be exempt from taxes does not hold on equity grounds, and given the financial and budgetary shortfall and constraints faced by the government, the need to tax agriculture gains greater urgency; *the principle of a tax on income should be applied irrespective of the source of income* (see Appendix 5.5 and Chapters 10 and 11). Moreover, as Box 5.10 shows, the loss to the economy on account of the absence of a proper agricultural income tax is quite substantial. Also see Chapter 10 on Taxation, for further discussion on the agricultural income tax.

5.6 The Water Crisis[49]

Of the total cropped area in Pakistan, which includes area sown more than once, of 22.15 million hectares, 18.04 million hectares or 81 per cent is dependent on irrigation primarily through canals and tube wells, showing the importance of a good irrigation system to Pakistan's economy and agricultural sector. As we show in Chapters 3 and 4, the development of water resources was a major focus of public investment in the 1960s, along with the increase in private tube wells. The increased availability of water was a key factor which led to the Green Revolution. However, the irrigation system and network in Pakistan has deteriorated in recent decades and a water 'crisis' has emerged.

Due to poor maintenance, the canal irrigation system has had its capacity of carrying water reduced, primarily because the desilting of canals has not taken place regularly and also due to the crumbling of canal banks. A 1994 World Bank study revealed that delivery efficiency—from the canal head to the root zone of crops—was around 35–40 per cent, implying that a substantial majority of water is being lost due to canal seepage, spillage, breaches, and watercourse losses. While this means that farmers do not get adequate water for their crops, particularly those farmers who are towards the tail-end of the watercourse, the loss of water also gives rise to waterlogging and salinity, of particular concern in the province of Sindh which is losing its fertile land due to this problem.

Five major issues are identified in what constitutes Pakistan's water crisis: (i) Pakistan does not have adequate reservoir capacity in its irrigation system to store water at peak flows where the country's rivers are highly seasonal with 85 per cent of annual flows in summer. (ii) As we show above, only about 40 per cent of water from the canal head reaches the root zone, causing waterlogging and salinity, with a large proportion being wasted. (iii) Although a very large infrastructure of irrigation exists in the country, it does not have a drainage system commensurate with the size of the network. This leads to rising water tables and further salinity and waterlogging. Without drainage facilities which can remove excess water and salt from the soil, further land will continue to be lost to this process. (iv) Inequality of power based on private property and privilege is a serious problem in Pakistan, particularly in the agricultural sector. Large landowners try to dominate the rural sector and are amongst the main culprits who steal water and misappropriate a share which is larger than what they are entitled to. They use pumps to get water from canals and are known to bribe local irrigation department officials to get an inequitable share of water. Also, since water availability is limited, often those at the tail-end of the irrigation system fail to get their share. (v) There has been insufficient maintenance of Pakistan's irrigation network and this has compounded the water crisis, causing losses, not just in terms of water, but also land and financial resources as well.

These numerous factors have all resulted in a scarcity of water, its misuse, and their impact on output, yield, and production. Waterlogging and salinity, which is said to affect 28 per cent of Pakistan's irrigated lands—50 per cent of Sindh's land—not only causes land to be lost to cultivation, but its spread towards otherwise uncontaminated land, also threatens such pastures. Add to this the growing pollution of rivers and water sources, caused as a consequence of urbanization, development, and the indiscriminate discharge of sewage and municipal waste and effluents, all of which has killed not only marine life in the rivers, but has also made this water hazardous for human consumption and for agriculture.

The drainage problem referred to above is considered to be a consequence of extending the modern irrigation system and assuming that nature would dispose of the additional water, as little thought was given to how this water was to be drained. The built system provided more water than the land was able to drain causing waterlogging and salinity on a large scale. In addition, this excess water—ironical though this is at a time when a lack of water has been an issue—has caused the water table to rise in places, leading to the degradation of land and the destruction of lakes. Although one can put forward the argument that better planning should have been undertaken when the irrigation system was conceived and planned, the capacity of the infrastructure has been overtaken by 'development', economic growth, and urbanization. The core systemic problem that one sees here with regard to the water issue, irrigation, and the lack of drainage is not unique to the agricultural sector, and is one which is found in almost every public sector initiative in Pakistan (also see Box 5.11).

5.7 Land Ownership, Power, and Land Reforms

Although we have argued in an earlier chapter that the social and economic structure of agricultural relations in Pakistan is not feudal, we have also said that there is a need for land reforms. It is important to emphasize the point that the desire and need for land and broader agrarian reforms, is dependent on the size of landholdings and their

Box 5.10
Revenue Potential from an Agricultural Income Tax

Masood H. Kizilbash writes about the potential economic and revenue impact of an agricultural income tax.

Income from agricultural activity has remained outside the federal income tax regime since the creation of Pakistan in spite of the formation of several committees, task forces, and commissions in the past for the examination of the issue. A ray of hope was rekindled recently when some of our parliamentarians vociferously pleaded for inclusion of the agricultural income in the budgetary proposals for 2010–11 at the federal level. As usual, the demand was spurned on questionable reasoning of the proposal as unconstitutional. If the argument holds ground, one wonders why it was not made a part of the Eighteenth Amendment unanimously passed recently containing more than 100 amendments in the constitution.

One had hoped that in view of large fiscal deficit aggregating Rs. 680 billion and a pressing need for resources, the provinces might feel obligated for patriotic reasons to at least raise the rates of presumptive land tax to a level that a portion of growth in income from liberal upward revision in support prices of principal crops such as rice, wheat, cotton, and sugar cane could be siphoned off for raising revenues. With the announcement of the provincial budgets this hope has also been dashed.

Agricultural income tax was introduced for the first time in 1996–97 by provinces as a part of a 'Reform Package'. The package was to be implemented in three phases. In the first phase beginning 1996–97, the provincial governments were to impose agricultural income tax on presumptive basis per acre of farm holdings with variations in rates between barani and irrigated land and exemption limits of 25 and 12.5 acres respectively.

During this phase a periodic downward revision of the exemption limits coupled with an upward revision in the presumptive tax rates was to be made so as to achieve a target of 0.5 per cent of GDP. In the second phase starting from July 1, 1998, agriculture income tax was to be assessed on the basis of 'rental value of land' for which valuation table in each district was to be prepared. This phase was to last two years.

In the third and final stage, income tax was to be based on assessment of 'total income' including income potential of land and income from other rural activities such as poultry, fish farming, forestry, and livestock. In this phase a tax schedule similar to one used for non-agricultural incomes was to be developed for assessing tax on agricultural income.

It was estimated in May 1996 that in the first year on the basis of 'presumptive land tax' the revenue will increase to Rs. 2 billion in 1996–97 and to Rs. 4.4 billion in 1997–98 as against land revenue yield of Rs. 1.3 billion in 1995–96. In the second phase, with the 'rental value of land' as a basis of assessment of tax, the revenues from AIT were to touch the level of Rs. 7.4 billion in 1998–99. In the final phase starting 2000–01, when assessment was to be based on income from land, land potential, and rural activities, total tax revenues were projected between Rs. 40–50 billion or more than two per cent of GDP.

The implementation of the reform package over a period of 5–6 years remained a nightmare. For, as outlined in the package, what to speak of determining 'annual rental value' of land in each district and calculation of presumptive income tax based on 'gross value of production minus cost of production', the provinces neither reduced exemption limits nor raised the rates of tax on landholdings despite manifold growth in income.

The result is that the combined provincial revenues from the so called agricultural income tax will be around Rs. 2 billion in 2010–11. At this level it will be just three per cent of the total provincial tax revenues and just 0.015 per cent of the GDP as compared with benchmark land revenue of Rs. 1.3 billion or 11 per cent of total tax revenue and 0.06 per cent of GDP in 1995–96. It explains that instead of AIT proceeds going up over last 14 years of the reform package, they have continuously declined.

Dawn, *Economic and Business Review*, Karachi, 28 June–4 July 2010

numerous consequences, and not simply on the nature of land ownership. Thus, while we would insist on the need for extensive land and agrarian reforms if there was feudalism in agriculture, we would continue to make the same, or at least similar, arguments in favour of wide ranging reforms in the agricultural sector, regardless of the mode of production, even when there was capitalist agriculture, as is the case now. The fact that there is a very large landowning class which, not surprisingly, is against any form of land reforms, only re-emphasizes the need to raise arguments which look at this issue.

This rural élite, which we argue is not feudal, has nevertheless, a disproportionately large influence on the 'social, political, and administrative structure of Pakistan. The effects are visible in different and disturbing forms throughout the society. The process of agricultural transformation has been greatly distorted by the influence of the landed élite and the wrong policies of successive governments. . . .'[50] The issue of land reforms is intrinsically linked with the issue of power and control of the ruling élite and the consequences of this power and control. This point is of even greater importance—as we show in Chapter 22—where poverty has emerged as one of Pakistan's biggest problems where one-third of the country's population—nearly 60 million inhabitants—live in poverty, most of them in rural areas. Whether it is access to the state bureaucracy—provincial or local—or to fertilizer, credit, and output markets, large landowners have far greater access than do small farmers. As Mahmood Hasan Khan states, there is 'no dispute that land is the primary factor determining the access to other factors in agriculture.'[51]

If we take the case of state credit availability and disbursement for example, we see that around 75 per cent of loans from the Zarai Taraqiati Bank Limited (ZTBL) have been towards farmers with holdings of more than 5 hectares, and much of this money has been used to purchase tractors and machines and to install tube wells. 'A substantial subsidy implied in public loans for agricultural production has been transferred to a small number of large landowners, farmers, and entrepreneurs, mainly on the basis of their political influence or contact'.[52]

Mahmood Hasan Khan argues that there is a 'bias in favour of large landowners and well-connected farmers which is built into the credit system because of risk minimization through the collateral requirement, low administrative cost and convenience, and the influence of landlords and similar urban-based groups. . . . Sharecroppers have no direct access to institutional credit'.[53] Given the high transaction costs and collateral requirements and numerous other constraints, the official disbursement of credit has been noticeably tilted in favour of large farmers, and the landless, the sharecroppers and even small farmers, have had to borrow from non-official sources, often at exorbitant usurious rates.

Much research that takes place in Pakistan and elsewhere, relies on data and statistics provided by the government on the basis of which policy is made. Sometimes surveys are held which help enlighten public policy. In a study conducted in 2003, a very extensive survey was conducted in Pakistan, in all the four provinces, and in the Northern Areas where the focus was on the very poor. The Pakistan Participatory Poverty Assessment asked thousands of individuals living in abject poverty about why they thought they were poor, about the nature of their poverty and about what they feel is necessary to get them out of that poverty. The results from this survey confirm what many people feel intuitively.[54]

The poor felt that the single largest reason for their poverty was lack of access to land, whether to own land (which most of them don't) or to work on land. The concentration of landholdings was a cause for the impoverishment of the poor because they have limited assets to work with, but more importantly, because this opens up vast possibilities for their

Box 5.11

The Water Crisis

An expanded water supply from the canal system has been a major source of change in the use of land. However, the availability of water has been constrained by several factors, some at the regional and others at the village level. Water acts as a major constraint because its management at the canal and farm levels is very poor, caused by inadequate physical infrastructure and the low level of water charges. Its distribution generally discriminates against the tail-enders and small farmers because of the unequal power of the small and large landowners in the village. In view of the chronic shortage of canal water in the country, the regions at the tail-end of the system are handicapped in adopting new crop varieties and adjusting the cropping patterns. Farmers in Sindh, in particular, are adversely affected since they are at the tail-end of the canal system and they cannot make use of the groundwater. Added to these problems is the persistent shortfall in the government's irrigation revenue to cover the maintenance and operation costs of the canal system. As part of the structural adjustment support given by the International Monetary Fund (IMF) and the World Bank since the mid-1980s, the canal irrigation system is expected to be transferred from the provincial irrigation departments to the so called autonomous (private) irrigation authorities. While this programme is consistent with the adjustment policies of the two international agencies, it has generated much genuine debate and controvery in the country with regard to its likely benefits and costs in the current social and operational environment.

ultra-exploitation and abuse. The power which derives from inequitable landholdings is a cause and reinforcement for keeping people in poverty. Moreover, land is seen to be an important source of power and well-being across all the rural sites where the survey was held—see Chapter 22 on poverty in Pakistan for further discussion.

There are numerous arguments which lead us to believe that there is a need for an extensive land reforms programme marked by a supporting agrarian reforms initiative—see Box 5.12. While restricting the size of holdings of landowners may eventually break their power on local administration and on the poor, distributing land to the landless will bring many of the 60 million poor out of poverty. Not only will their economic welfare improve, but so will their social position once they have access to and own land. Economic evidence also suggests that there is an inverse relationship between size and productivity: above a certain minimum threshold, smaller farms are more efficient and productive compared to larger farms. The fact that the earlier land reforms—see Chapter 3—have not been a resounding success because there were problems in design and they were not properly implemented and because they were not supported by a package of broader agrarian reforms, only means that this time round there is a need to build on those experiences and learn from previous mistakes. A comprehensive land reform programme backed up with easier terms and access to water, credit, marketing, extension, and advice could address Pakistan's poverty question as well as remove the constraints that have emerged in the agricultural sector. Sadly however, the General Musharraf government which took over power in 1999 or the elected government following him in 2008, have repeatedly said, that they do not favour land reforms. This means that the inequitable hold over land and power will continue in Pakistan's rural sector, and also that poverty is unlikely to be reduced significantly.

Just as an agricultural income tax is a must on income earned from agriculture, simultaneously, reforms in the agricultural sector, which favour the poor, the landless, and the small farmer are also essential. It has become unfashionable in the Pakistani context to talk about land reforms, but the arguments are still valid. Whether it is the distribution of state land to landless peasants or the more radical demand for the imposition of lower ceilings on land holdings and redistributing land above that limit to landless farmers, such demands need to be part of the public discourse to warn against the sort of violence and injustice which takes place on account of extremely inequitable landholdings in the presence of an effective state machinery which is in the control of the landlord. Unequal land ownership in the context of Pakistan also leads to forceful and disproportionate acquisition of other public goods such as water. The highly exploitative treatment of peasants, particularly women in rural areas, is one of the consequences of the absence of justice and the presence of power derived from owning land. Many of the problems which exist in rural Pakistan emanate from the pattern of landholding. The demands for land and agrarian reforms are just as pertinent today as they were three or four decades ago. Rather than planning to sell or lease Pakistani agricultural land to the Arabs which the Pakistan People's Party government of Yousuf Raza Gillani and Asif Zardari came up with—see Box 5.13, it might be more appropriate to think of mechanisms related to land and agrarian reform in Pakistan which help Pakistan's landless and poor peasants directly. The option of land reforms ought to be always high on the agenda and an option worth stating.

Haris Gazdar highlights the important distinction between *land* reforms and *agrarian* reforms in Pakistan, reminding us of the critical distinction between both, making the case that one needs to 'broaden the view' about such reforms. He argues:

> The conventional debate about land reform has been linked very closely with analysis of agrarian structures. The main—perhaps the exclusive—focus was on land as an agricultural asset. Land reforms were regarded as the means for effecting distributive and technological change within an agricultural economy. Land reform, in fact, was often thought to be synonymous with agrarian reform, with primary interest being directed to crop farming. Perhaps the declining salience of land reforms from the policy and political agendas is to do with economic diversification. If crop farming is but a small part of the national economy, employment in crop farming (for landowners and the landless alike), represents just one out of many sources of livelihood. It is not surprising that the scramble for public sector jobs competes with mobilization for land reform as a consumer of political energies. . . .
>
> . . . The returns on land ownership, moreover, are not simply of a straightforward economic nature. Control over land and its use is leveraged into advantage in broader spheres in the economy and politics. Despite the declining salience of crop farming and agrarian reform from the policy and political agendas, the ownership and possession of land remains an arena of intense contest. . . .
>
> . . . Broadening the view means paying attention not only to crop-farming but to issues in the ownership, access and use of land for a range of economic purposes. Even within a traditional agrarian economy usufruct rights to uncultivated land were of immense economic value to local residents.[55]

Some economists have shown empirically that land reforms in rural areas may not lead to economic growth, and hence have argued that such reforms are not worth pursuing. Their empirical evidence may indeed show why this would happen, for a number of reasons, although there is also a large body of evidence which contradicts such findings and shows the exact opposite. Such is the state of economics. However, if economists simply see land reforms as a growth-enhancing intervention, they miss much of the social and political consequences of holding on to large tracts of land in societies where there are far more small and landless farmers. Inequality, especially on account of land holdings—as opposed to say, opportunity—does give rise to social

Box 5.12

The Benefits of Land Reforms

Aadil Mansoor makes the case for land reforms in Pakistan.

That land reforms lead to efficient utilization of land, improved agricultural production, employment, and poverty reduction is a well-established argument, supported by theory and empirical evidence. China and several countries of East Asia have successfully used land reforms to reinvigorate agricultural growth, promote employment, and reduce economic and social inequalities. In the case of Pakistan, a growing and vibrant agriculture sector in the 1960s marred the need for the much needed land reforms. While two formal attempts at land reform were made in 1959 and 1972, both failed to achieve their stated objectives as they were mainly meant to contain social unrest and political chaos and to gain popular support in times of crises.

A closer look at the cultivable land ownership and use statistics of Pakistan make the need for land reforms obvious. First and foremost, research shows that in much of the developing world, where agriculture is characterized by constraints to investment and mechanisation, small and medium-sized farms (12 acres) are more efficient than large-sized farms (20 acres). Several empirical studies demonstrate that, if the effect of capital, technology, and other factors is held constant, the income per acre of land from small farms can be up to double that of large farms. This becomes possible because of a higher allocative efficiency of land in the case of medium and small-sized farms and the lower reservation price of labour for small farms in contrast with the larger farms that have to hire labour thus making it expensive for them.

Secondly, the Pakistan Agricultural Census shows that nearly 40 per cent of the arable land (i.e. 4 million hectares) is not cultivated in a given year. Almost 2/3 of this utilization land is held by large landowners, who own 25 or more acres of land, pointing towards the unmanageability or inefficiencies that are associated with large and concentrated landholdings. In contrast, most small farms cultivate over 90 per cent of the arable land, deriving maximum benefit per acre of land.

The third important issue pertains to the weak land tenancy in the country, where nearly one-third of the cultivable area is under tenancy. Amidst an absence of tenancy regulation and social safety nets, tenants are more often than not wholly dependent on and indebted to the landlords. Often tenancies are carried from one generation to the other and so are the debts and obligations, at times taking the form of bonded labour. Tenancy contracts are mostly informal and hence not enforced legally. Research has shown that incomplete tenancy contracts lead to 'investment holdups', where due to tenure insecurity the tenants tend to under-invest in productivity, thus leading to inefficient and suboptimal factor productivity of land.

Fourthly, in Pakistan's 'labour surplus' economy, almost 44 per cent of the labour force is employed by the agriculture sector. Due to the highly concentrated distribution of land, a large part of the labour force is landless and is hired seasonally, while others work as sharecroppers or tenant families under a wide range of contract and tenancy regimes. However, as discussed above, the efficiency losses from incomplete contracts and insecure tenancies can be overcome by means of land redistribution and private ownership, where land can be distributed to a part of this labour force thereby creating incentives to invest in productivity enhancement and conservation.

And finally, land being the most valuable asset and a symbol of social status also serves as a source of monopolization of political and social power. In Pakistan, unequal landholdings have led to social polarization and exploitation of the landless and small holders by the landed élite. In the rural arena, feudal capture of political institutions, public service delivery and extension services, access to farm credit, sources of inputs, and means of marketing is hard to ignore. This has not only affected agricultural productivity but also suppressed the social, political, and economic progress in the country.

One may ask that, given a total failure of previous land reform efforts, is land reform a mere idea in Pakistan's context? Experts have extensively reviewed the land reforms of 1959 and 1972 and have suggested that the failure of earlier land reforms was not a 'strategy failure'—i.e. land reforms as a strategy for improving factor allocative efficiency and agricultural productivity and reducing unemployment, economic inequalities, and poverty. Various studies have suggested that reforms failed due to a) lack of political commitment, b) loopholes in legislation, e.g. provisions for exemptions and allowance of land transfer to heirs, c) the burdensome payments that the beneficiaries had to pay for the allotted land, and d) centralized and inefficient bureaucratic administration.

Recent land reform experiences of China, East Asian economies, and selected regions of South Asia provide substantive evidence that land reforms are not only possible but also lead to positive economic and social outcomes. Depending upon the political, social, and economic context, base conditions, and specific objectives, different countries have applied different policy instruments, strategies, and management models to land reform. The choices, trade-offs, and balancing acts have involved setting the ceilings for landownership, government engagement versus the use of market based approaches (e.g. incentives, penalties, and taxes), allocation and pricing of expropriated land, and time frame for implementation. Pakistan can draw upon a wealth of international experience and learning to develop its land reform strategy.

Box 5.13

Selling Pakistan to the Arabs?

Myra MacDonald commented on the Pakistan People's Party government's decision to sell Pakistani agricultural land to the Arabs.

Any student of history will tell you that a recurring feature of 20th century revolutions and civil wars was conflict over land ownership, driven by the resentment of the rural poor against the concentration of agricultural wealth in the hands of the élite. (Cuba and Vietnam, where Fidel Castro and Ho Chi Minh picked up support by championing farm reform, are good places to start.)

So Pakistan's plans to sell farmland to rich Gulf investors deserve serious attention, even if land ownership does not have the same ability to grab headlines as its nuclear weapons. Waqar Ahmed Khan, the Federal Minister of Investment, said last month Pakistan was offering one million acres of farmland for lease or sale to countries seeking to develop food supplies, and was holding talks with Saudi Arabia, the United Arab Emirates, Bahrain, and other Arab states. He said all land up for sale or lease was currently unused and promised to hire a security force of 100,000 men, funded by foreign aid, to protect their investments.

His comments prompted a column in U.S. website The National Interest, which argued that the farmland sales would serve as a recruitment tool for Islamist militants who have already picked up support by championing the cause of Pakistan's rural poor against the feudal élite which dominates the country. The devil, as usual, will be in the details, but the following obvious questions spring to mind. What does it mean for Pakistan's fractured society?

http://blogs.reuters.com/pakistan/files/2009/05/wheat.jpg

In an article in the Huffington Post, Eric Margolis became the latest to argue that the battle against Islamist militants in Pakistan's north-west is in danger of morphing into a much wider conflict—'a national revolution in Pakistan against the western-backed feudal oligarchy that has ruled it since 1947.' If correct, then any perception that the rich were benefitting from farmland sales at the expense of the poor would only stoke this anger further.

An editorial in the Daily Times says that 'despite the blatant forms of exploitation that keep occurring due to skewed landholding patterns in our rural areas, it was disappointing that major political parties did not squarely take up the issue of land reforms in their manifestoes prior to the 2008 general elections. Conversely, instead of trying to take concrete steps to empower the rural poor, the current government is now trying to lease or sell large tracts of agricultural land to Arab states, in lieu of attracting foreign investment to Pakistan.' http://blogs.reuters.com/pakistan/files/2009/05/indus.jpg

'Government officials claim that the land being offered to the Arab nations is not under cultivation, therefore there is no threat of displacement of indigenous communities, or erosion of local food sovereignty. However, the environmental hazards posed due to deforestation, land degradation, and increased water consumption also need to be taken into account before making such confident claims,' the editorial said.

Dawn newspaper reported that the provincial government in Balochistan was putting the brakes on plans to sell farmland to Arab investors. However, the unnamed experts it quoted appeared to be divided between arguing that farmland sales would bring much needed investment and modern management techniques to Pakistani agriculture and questioning the details of how the scheme would be implemented—rather than opposing the idea outright. So what kind of farming would outside investors bring to Pakistan?

Modern, intensive farming methods are high on productivity and low on labour—suggesting there would be few employment opportunities for the rural poor other than to guard the food that is to be shipped out of the country—unless the scheme includes parallel investment in infrastructure and agriculture-related business like food processing.

Environmentalists also complain that intensive farming usually relies heavily on the use of fertilizers and pesticides, polluting the surrounding environment, and by clearing large tracts of land can contribute to soil erosion and, in some places, desertification. So depending on how the scheme is implemented, Pakistani farmers could suffer, rather than gain, from the expected influx of modern farming methods.

And what about the demand on water?

Since the government says it plans to sell or lease farmland which is not currently being used, the demand on water is likely to increase. Yet Pakistan already faces water shortages, partly due to its rising population. Global warming, which is slowly melting the Himalayan glaciers which feed the country's rivers, is likely to make water supplies more erratic, increasing flooding and reducing further the availability of groundwater for farming. And as discussed elsewhere, water scarcity is likely to increase tensions with India about the use of water from rivers they share in divided Kashmir.

It's too early yet to judge how the scheme would work. And in an article in Britain's Independent newspaper, David Hallam, the deputy director of the trade and markets division at the Food and Agriculture Organization, was quoted as cautioning against making over-hasty judgments about global farmland sales as a whole. 'This could be a win-win situation or it could be a sort of neo-colonialism with disastrous consequences for some of the countries involved,' he said. 'I really do have an open mind to whether this new development is positive or not.'

What is clear, however, is that in a country like Pakistan that has been turned into a tinderbox, every spark is potentially explosive.

Myra MacDonald, 'Pakistan's farmland sales: a fatal folly?', *Reuters*, 6 May 2009.

inequities which have far greater repercussions than just growth.

Arguments against land reforms in Pakistan and elsewhere have become legitimized, mainly by economists, but also by other categories of social scientists (and of course the landowners themselves), on the basis of different types of empirical evidence. While land reforms, which mainly imply the redistribution of land from large landlords to small or landless farmers or distributing state-owned land to landless farmers, may not increase overall growth, in some cases, large, corporatized, highly capitalized landholdings have been shown to do so. According to this argument, rather than break farms down in size, it is better to consolidate and mechanize.

Other reasons why land reforms are not supposed to be on the political agenda is that due to inheritance laws in Pakistan, land has already, over the generations, been fractured and made smaller, in all categories of landholding. The average farm size in Pakistan has also fallen markedly over the decades, as one would expect, and will continue to do so over the next few decades. Moreover, arguments are also made that relations of production are also no longer feudal, and hence there is no need to undertake land reforms. They also argue that the process of urbanization is doing away with large landholdings, and that it is just a 'matter of time', when most of Pakistan will become urban, relegating the issue of rural land.

Sadly, for all these reasons, some political parties in Pakistan have bought into this empiricist logic and do not consider even raising slogans about land reforms which, while unlikely to be ever fulfilled, demonstrate an understanding of issues and explanations of social inequity and injustice. As a consequence, land reform has become a little *passé* on Pakistan's political map.

One could, of course, wait another half century when the process of inheritance would have fractured the size of holdings even further and urbanization would have made much rural land redundant, giving rise to a Malik Riaz-type phenomenon demonstrating the power of urban land. By then, possibly, there might even be a tax on agricultural incomes, and perhaps a little bit of education and some understanding about justice and equality about women. But left to a natural process, some of this might never happen.

Intervening in what is the source of so many of Pakistan's problems in rural areas will not only speed up the eventual outcomes, but will also provide some sense of justice to those who will benefit, three generations sooner. Moreover, there are also empirical studies which show that land reforms actually increase a country's economic growth, especially if agrarian reforms accompany land reforms. Studies have shown that land reforms had a significant and positive impact on income growth and accumulation of human and physical capital. Land reforms have also been seen to have a positive impact on equity.

The power of land extends far beyond the horizons of the landed estate and externalities of large holdings are many. Despite the evolving changes which have taken place in Pakistan's agrarian economy and in landownership, the demand for land and agrarian reforms are just as pertinent today as they were three or four decades ago. They ought to be always high on the agenda of every political party, as an option worth implementing, particularly by those who promise a break from the past.

5.8 Summary and Further Reading

5.8.1 Summary

Having presented a history of agriculture in Pakistan in the previous three chapters, in this chapter we have reviewed the agricultural sector as it is today. We have examined the main trends in output, production, irrigation, etc. over the last six decades and more, and seen how this sector has evolved. From being the dominant contributor to GDP in the 1950s, the agricultural sector today contributes half than the services sector and even less than industry. Hence the often-repeated claim that 'Pakistan is mainly an agricultural country' is questionable based on this evidence. While agricultural production has increased over the last six decades, there has been somewhat of a reversal in these trends in recent years, which should be cause for concern. From peak production years in the mid-1980s, the index of agricultural production for all crops has varied quite dramatically. There is a growing belief that agriculture is in the throes of a serious crisis, and that drastic measures need to be undertaken to enhance output, arrest waterlogging and salinity, and bring forth another Green Revolution reminiscent of the agricultural changes in the mid-1960s.

A number of bad policies may have been responsible for creating this crisis. Economic incentives were not given to farmers, as they were expected to subsidize urban consumers and continue to increase output despite a lack of adequate pricing policies. Mechanization was heavily biased against the smaller farmers in favour of the large and very large producers. This was despite the fact that, as shown in Chapter 4, the structure of ownership and mode and means of production had undergone a radical transformation, with smaller farms emerging at the expense of larger farms. Credit to farmers continues to be a weak link in the input–output chain, where higher rates from the informal sector affect the small farmers. Moreover, overall credit to farmers is insufficient, and far less than can be justified. While direct production-related issues like types of seeds and salinity may have affected agricultural output, some of the ancillary inputs such as credit and guidelines such as pricing signals may also be a cause of poor performance. Finally, without meaningful land and agrarian reforms, many of the problems in Pakistan's agricultural sector will go unaddressed.

One must also recognize two new, interlinked, trends in the rural/agricultural sector, which bear repeating. Firstly, that the urban-rural divide is getting narrower and is diminishing, and secondly, that all rural is not exclusively, or even primarily, agricultural. Both these facts will have a crucial impact on the future of agriculture and agrarian relations in Pakistan. Today, the non-agricultural rural sector generates nearly 60 per cent of total rural incomes. Moreover, remittances, both domestic and foreign, are also an important supplement to the income of those who live in areas designated as 'rural'.

Issues of rural poverty and inequality—discussed at length in Chapter 22—are not only linked with landownership and agricultural production, but now have other causes as well which need to be understood and highlighted. A World Bank study of 2007, concluded that,

> although agriculture is at the heart of the rural economy, the majority of Pakistan's rural poor are now neither tenant farmers nor farm owners. Farmers (including both owners and tenants) comprised only 43 per cent of households in the bottom 40 per cent of the rural per capita expenditure distribution in 2004–05. Non-farm households (excluding agricultural labourer households) accounted for slightly more than half (52 per cent) of the poor. Overall agriculture (including both crop and livestock production) accounts for only about 40 per cent of rural household incomes; the poorest 40 per cent of rural households derive only about 30 per cent of their total income from agriculture'.[56]

Agrarian policy and reforms, need to take cognizance of these trends and changes. Box 5.14 offers a response by the Panel of Economists set up by the Government of Pakistan to address some problems in the agricultural sector. Also see Appendix 5.6 for an earlier response to Pakistan's agricultural problems.

5.8.2 Further Reading

Many of the contemporary issues facing the agriculture sector are discussed frequently in newspapers and magazines, and these are an important source for more information and understanding of the sector (see Appendix 5.5). With taxation taking on more importance lately, numerous articles, almost all in favour of agricultural taxation, appear in the press regularly. Other than newspapers and magazines, a few books and reports discuss the key issues facing agriculture in the past and today. These are:

Ahmed, Viqar and Rashid Amjad, *The Management of Pakistan's Economy, 1947–82* (Karachi: Oxford University Press, 1984); Ijaz Nabi et al. *The Agrarian Economy of Pakistan: Issues and Policies* (Karachi: Oxford University Press, 1986) are two good references.

Two reports by the Government of Pakistan are also very useful: *Report of the National Commission on Agriculture, 1988* and *National Taxation Reforms Commission: Final Report*, 1986.

Some publications since 1999 are also very useful in this regard and should be consulted.

Mahmood Hasan Khan's 'Agricultural Development and Changes in the Land Tenure and Land Revenue Systems in Pakistan', in Khan, Shahrukh Rafi, *Fifty Years of Pakistan's Economy* (Karachi: Oxford University Press, 1999), summarizes many important issues. In addition, the Mahbub ul Haq Human Development Centre's Report, *Human Development in South Asia 2002* (Karachi: Oxford University Press, 2003), focuses on agriculture and rural development in Pakistan and the region, as does Akmal Hussain's *Pakistan National Human Development Report 2003* (Karachi: UNDP/Oxford University Press, 2003).

Innovative Development Strategies (Pvt), *Profiling Pakistan's Rural Economy for Microfinance* (Islamabad: Pakistan Microfinance Network, 2009), is recommended for examining the rural financial market in Pakistan. PILDAT in Islamabad has produced a Briefing Paper: *Taxing the Agriculture in Pakistan*, Briefing Paper No 42 (Islamabad: PILDAT, November 2011), which summarises many of the debates pertinent to taxation in agriculture. Professor Mahmood Hasan Khan two books which examine the role of rural development and community participation are: *Community Organizations and Rural Development: Experience in Pakistan* (Lahore: Vanguard, 2001); *Participatory Rural Development in Pakistan: Experience of Rural Support Programmes* (Karachi: Oxford University Press, 2009); *Agriculture in Pakistan: Change and Progress 1947–2005* (Lahore: Vanguard, 2006), contain many of his seminal articles over the years. See also Panos South Asia, *Leveling the Playing Field: A Survey of Pakistan's Land Reforms* (Kathmandu, Nepal: Panos South Asia, 2011).

Box 5.14

Institutional Framework for a Small and Medium Farmer: Agriculture Growth Strategy

The Panel of Experts set up by the Government of Pakistan in 2010 came up with some suggestions of addressing the problems in the agricultural sector.

An important factor in the current economic crisis is the food deficit and the underlying stagnation in yield per acre of major crops. (In the year 2007–08 crop sector growth was negative.) It can be argued that if the yield potential of the small and medium farm sector (less than 25 acres) is achieved, food shortages can be converted into food surpluses. In the existing high prices of food grain in the international market, such a shift can enable Pakistan to convert its weakness into its strength: The current crippling economic burden of food imports can be converted into a strength through food exports. To bring about this transformation a new policy framework is required to shift from the earlier elite farmer strategy to a new small farmer growth strategy.

When the 'Green Revolution' technology became available in the late 1960s it was possible to substantially accelerate agriculture growth through an elite farmer strategy which concentrated the new inputs on large farms. Now the crucial determinant in yield differences became not the labour input per acre in which small family farms had been at an advantage in earlier decades, but the application of the seed-water-fertilizer package to which the large landlords with their greater financial power had superior access. Thus the 'Green Revolution' had made it possible to accelerate agriculture growth without having to bring about any real change in the rural power structure. Today, after almost four decades of the elite farmer strategy, the imperative of land reform is re-emerging, albeit in a more complex form than before. As the large farms approach the maximum yield per acre with the available technology, further growth in agricultural output increasingly depends on raising the yield per acre of small farms and reversing the trend of land degradation brought about by improper agricultural practices.

The small and medium farm sector whose yield potential remains to be fully utilized, constitutes a substantial part of the agrarian economy. Farms below 25 acres constitute about 94 per cent of the total number of farms and about 60 per cent of the total farm area. From the viewpoint of raising the yield per acre of small and medium farms (i.e. farms of less than 25 acres) the critical consideration is that 15.7 per cent of the total farm area in the less than 25 acre farm category is operated by landless tenants. Another 13.07 per cent of the farm acreage in less than 25 acre farms is operated by owner cum tenant farmers. Since tenants lose half of any increase in output to the landlord, they lack the incentive to invest in technology which could raise yields per acre. Because of their weak financial and social position they also lack the ability to make such investments. Their ability to invest is further eroded by a nexus of social and economic dependence on the landlord which deprives the tenant of much of his investible surplus.

This problem is further exacerbated by the absence of an efficient land market where productive land can move to the more efficient operator. Institutional changes are required to enable flexible and secure tenancy contracts, and a competitive land market which can allow efficient operation of farmland.

The objective of raising yields in the small farm sector is inseparable from removing the constraints to growth arising out of the institutional structure of tenancy. A policy initiative that enables the tenant to acquire land is therefore an essential first step in providing the small farmers with both the incentive and the ability to raise their yields/acre.

State Land for the Landless

An initial step in providing productive assets to the rural poor could be to allot the available 2.6 million acres of state-owned land to the landless. This cannot be seen as a substitute for a land reform programme of 'land to the tiller'. According to the Census of Agriculture 2000, there are about 4.97 million acres of private farm area under pure tenant cultivation in farms below 25 acres. It is this acreage that would need to pass into peasant ownership for a genuine land reform to occur. Nevertheless 2.6 million acres (assuming that all of it is cultivable) could make a significant contribution to the reduction of rural poverty. For example if the 2.6 million acres of state-owned land were to be transferred to landless farm households in holdings of 5 acres each, then as many as 520,000 tenant farmers would become owner operators. This means that out of the total number of tenant farmers (about 897,000) in the less than 25 acre category, as many as about 58 per cent would become owner operators.

However, it is important to recognize that providing ownership of land to the landless is a necessary but not a sufficient condition for alleviating their poverty. Enabling the landless to make the transferred land cultivable, to actually settle on the new land and to achieve a sustainable increase in their income, productivity, and savings are equally important factors in making the scheme successful.

Appendix 5.1

Problems in Pakistan's Agriculture

In an article published in September 1996 in a local newspaper, Muhammad Ilyas presented the main arguments from a World Bank report on Pakistan's agriculture. This appendix is an edited version of Muhammad Ilyas's newspaper report.

> The World Bank in a recent report on the grave environmental situation in Pakistan has recommended enforcement of genuine land reforms as an essential measure to ensure sustainable exploitation of the natural resources including land and water. The report 'Pakistan: Economic Policies, Institutions and the Environment' prepared by Rashid Faruqee and Jonathan Coleman, said that giving ownership to farmers would help protect the environment. Land redistribution among cultivator farmers also eliminates chances of voter-exploitation by landlords. However, as Faruqee and Coleman have pointed out in the report, 'Because the laws in Pakistan were lax and easy to circumvent, past land reforms did not bring about the desired change in land tenure and did not have any effect on environmental protection.' 'Redistribution of income and wealth has an effect on the environment', they stress.
>
> Poverty and population growth have contributed to the degradation of the environment in Pakistan, where they have caused soil degradation, deforestation, rangeland degradation, marine and coastal zone damage, and many forms of urban and industrial pollutions. 'Short time horizons are not innate characteristics, however, but are the outcome of policy and institutional and social failures', the report points out.
>
> Poor farmers face very high production and financial risks that are often the result of misguided policy interventions in factor and product markets or insecure land tenure. Many poor farmers with below subsistence holdings are unable to afford the mechanism available for coping with risks, such as selling stored crops, credit and crop insurance, and have limited access to extension and market information. In many cases, they have no choice but to over-exploit the available natural resources.
>
> These misguided policies are at the roots of many serious environmental problems. Take salinity for example. Surveys have shown that three-fourths of tube wells provide brackish water that is unfit or only marginally fit for agriculture, resulting in salinity. Most of these tube wells are set up with subsidies and have been running these on subsidized electricity and selling the water at rates much higher than what is paid for canal water.
>
> On the basis of farm-level data, it has been estimated that yield losses in wheat as a result of sodic irrigation water were 9 per cent and 20 per cent in two different locales in the central Punjab. Experts have also estimated that crop yields are reduced by about one-third for crops grown on slightly saline areas and that yields on moderately affected areas are reduced by about two-thirds. Crop production of any kind is difficult on highly saline soils, the report has pointed out.
>
> Another instance of influential landlords laying their hands on government funds is the subsidy on application of gypsum. The government undertook a programme to popularize gypsum in order to combat the salinity that is caused by low-quality tube well water. A similar programme was very successful in the Indian Punjab, where the problem of salinity has been drastically reduced through the use of subsidized gypsum. There are, however, no data on the effects of the Pakistani programme. Field experience indicates, however, that in most instances, influential landlords were the main beneficiaries of the subsidies. Moreover, the report observes, application of gypsum to fields has not always followed disbursement of subsidies, because of rent-seeking behaviour. In other words, the subsidy money was misappropriated.
>
> Waterlogging is also a function of a faulty water rate system which the conglomeration of big landlords and the bureaucrats does not allow to be changed at all. As the report also remarks, underpricing of water and the complicated system of assessing water rate liability eliminates incentives to use water efficiently and has aggravated waterlogging and salinity.
>
> The structure of water pricing provides no incentives for using canal water efficiently, and discourages investments in water conservation, such as drip or sprinkler irrigation systems. Capital intensive agricultural practices are other characteristics of absentee landlordism. Facilitated by factor price distortions, these lead to the adoption of production methods that do not reflect factor endowments. Subsidies or targeted credit for tractors and threshers, to which again only the big landlords have access, have displaced labour, for example.
>
> The indiscriminate use of agricultural chemicals, such as fertilizer and pesticides—which small farmers with 93 per cent of farms but representing only about 41 per cent of the cultivated area cannot afford—has contaminated ground- and surface water. Their use in Pakistan's irrigated agriculture has expanded rapidly over the past twenty years. Excess nutrient loading as a result of fertilizer run-off can lead to uncontrolled algae growth.
>
> The widespread use of often dangerous pesticides on the cotton crop is associated with several potential health hazards, including contamination of workers who apply it (three-quarters of producers use a back-pack sprayer and no protective clothing), harvesters (all of whom are women), soil and groundwater used for drinking, and consumers of agricultural products. Summarized evidence from blood tests shows that as many as one third of cotton workers in Pakistan have been exposed to dangerous levels of pesticides, according to the report.

Appendix 5.2

Appendix 5.2
Summary and Time Frame for Structural and Policy Reforms in Agriculture

Policy area	Objectives	Measures	Proposed timing of initiating measures and expected implementation period
Incentives	Market-determined output prices	*End subsidy on wheat imports	1994/5, short run
		*Remove wheat and flour import restrictions	1994/5, short run
		*End support prices for sugar cane	1994/5, short run
		End support prices for all other crops	1995/6, medium to long run
		Initiate study into alternative means of reducing volatility of agricultural prices	1994/5, short to medium run
		*Build up enabling environment for private sector entry into storage and distribution	1995/6, medium run
		Regulation of processing industry where necessary	
		*Complete trade reform	1995/6, medium run
	Trade policy reflecting comparative advantage	Remove export taxes, import duties, and quantitative restrictions	1995/6, short to medium
		Extend income and wealth tax to agriculture	1994/5, short run
	Efficient and equitable tax system	Eliminate all agricultural tax exemptions Update tax base in agriculture by review of Producer Index Units	1994/5, short run 1994/5, short run
		Installation of mechanism for periodic review of Producer Index Units	1995/6, short to medium run
Input markets	Private sector production and distribution of commercial inputs	*Privatize urea production and distribution	1994/5, short run
		Divest National Fertilizer Corporation, including plants operated by its subsidiaries	1994/5, short to medium run
		*Expedite privatization of phosphate imports	1994/5, short run
		* Level playing field between public and private sector in input markets	1995/6, short run
		*Commercialize seed corporations	1994/5, short run
		Privatize seed corporations	1995/6, medium run
		Strengthen seed certification process	1994/5, medium run
	Market-determined input prices	Remove subsidy on electricity	1995/6, medium run
	Reform the irrigation system	*Decentralize irrigation system based on water user associations, public utilities, and market in water rights	1995/6, medium
		*Raise irrigation charges	1994/5, short run
	Remove distortions in land markets and reform credit provision	Initiate a study of land reform	1994/5, short run
		*Improvement and computerization of land records	1994/5, medium run
		Clamp down on delinquent loans and end cheap loans for machinery purchase	1994/5, short run
		End directed credit	1994/5, short run

Appendix 5.2 continued

Policy area	Objectives	Measures	Proposed timing of initiating measures and expected implementation period
Government expenditure	Reorient public expenditure towards changing needs of agriculture and ehance efficiency of expenditure programme	Reduce burden of administrative expenses on research and extension budget and increase operational funding	1995/6, short run
		Introduce new research priorities including research on farming systems, growth-enhancing public goods, and the environment	1994/5, short run
		Induce private sector to undertake privately profitable research	1994/5, short to medium run
		Introduce patent protection for seed varieties	1994/5, short run
		Reduce duplication and increase co-ordination of research institution to minimize wastage of resources	1995/6, short to medium run
		*Reduce the number of front-line extension workers and replace them with fewer, better trained workers, more responsive to the needs of farming system and not just given corps	1995/6, medium run
		*Open consulting services by adaptive research institutes to better off farmers on a cost-sharing basis	1994/5, medium run
		*Extensive use of mass media and other group approaches for basic messages about available technology and better farming systems	1994/5, medium run
		Increase investment in education, including functional education of farmers	1995/6, medium to long run
		Remove subsidies on capital	
		Target developmental expenditure towards poor and marginal farmers	1994/5, short to medium run 1995/6, medium run
Poverty	Rural poverty alleviation	Develop participatory, community-based organizations	1995/6, medium run
		Ensure enforcement of tenancy protection	
		Price water at economic cost	1995/6, short to medium run
Environment	Environmental protection and sustainable development	Phase out sapling subsidy to encourage private sector participation in sapling market	1995/6, short to medium run 1994/5, short to medium run
		Regulate pesticide use	
		Provide incentives to use Integrated Pest Management	1994/5, short run 1995/6, medium run
		Create community institutions to manage local resources and common property	1995/6, medium to long run
		Encourage private and public sector investment in soil and water conservation	1995/6, short to medium run

*Element of high priority

Note: For implementation periods, short run implies 1 to 2 years, medium run 3 to 5 years, and long run 5 to 7 years.

Appendix 5.3

The Determination of Support Prices for Agricultural Commodities

How should agricultural support prices be determined?

Support prices for agricultural commodities can be determined either on the basis of the cost of production or by what is termed as the 'parity approach'.

The cost of production approach aims at guaranteeing a fair return of a certain crop to the farmers and establishing a balance between a number of competing crops so that an optimum cropping pattern is achieved. Subject to soil, climatic, and other agronomic conditions influencing crop substitution in certain areas, cropping patterns can be moulded to correspond to planned production targets. For instance, wheat competes for area with both cotton and rice so a certain balance between the prices of the three commodities can help in attaining their required production levels.

However, there are certain problems in the cost of production approach. Agricultural production requires a number of inputs which are not marketed and whose valuation will, therefore, present difficulties. Such inputs include labour, management, and land. Labour and management costs, which should be the share of the entrepreneur, are difficult to assess. Similarly land rent, which may be the single largest cost item, is difficult to determine in a country where there is no organized land market.

The regional variations in physical resource endowments also have to be taken into account in the choice of samples for calculating cost. Moreover, with rise in prices, the cost of production has to be periodically adjusted.

The cost of production is also related to technology. For purposes of price support the cost of production may either pertain to old traditional technologies, which means a higher level of support price, or to the new technologies where costs may be low. A support price based on the new technology cost structure will have adverse equity effects particularly if the new inputs are subsidized or a large number of farmers have no access to the new technology. Large holdings with lower production costs may get higher net returns compared to small holdings. Thus the higher the support price, the greater the transfer of income to large holdings from the general revenues. It is now believed that the support price programme in Pakistan has operated in contradiction to the original intent of better income distribution among various segments of the rural farm sector since, mainly, the cost of production approach has been followed while determining the structure of support prices.

In addition to the problem of identifying the technology and the cultivators using that technology, there is another question: which cost should be taken into consideration? Average or incremental? In a production system as varied as Pakistan's agriculture in technology as well as scale, both types of unit costs are bound to create complications.

The 'parity price' approach is used in order to correct imbalances in terms of trade between the agricultural and the non-agricultural sectors. The 'parity price' is an output price that will yield income which will buy the same quantity of other products as it would in some specified based period. Thus a balance can be maintained between the prices of commodities sold by the farmers and the commodities which they purchase. It can be calculated through a comparative index of agricultural and non-agricultural prices. In this approach, the effects of inflation which keep upsetting the income and expenditure structure of the farm household are accounted for. Although it is free from the usual objections of lack of scientific rigour and bias in favour of transfer of resources to a particular category of landholding, the choice of the base year for working out the parity ratio may introduce some distortion in the income distribution pattern of different tenure and size farm categories.

The choice between the two approaches depends upon the relative importance of various objectives of the price support programme. If the major objective is providing production incentives for particular crops or crop combinations, the cost of production approach may serve the purpose at least in the short run. Parity prices, on the other hand, provide a range within which prices may be located in order to reflect the influence of the forces of demand and supply as well as the long-run objective of equity between urban and rural sectors.

In addition to the two approaches mentioned above, three other criteria are sometimes used for determining support prices: (i) open market prices; (ii) inter-crop parity index; and (iii) world prices.

An assessment of the open market price, as determined by the supply-demand interaction, is essential and should be kept in mind while making decisions regarding the support price. It serves as a retraining factor since too much deviation from the open market price may make the price support programme unrealistic and ineffective. It is, however, difficult to make an accurate assessment of the open market price since the markets are highly imperfect, unstable, and dominated mostly by a few buyers (*arhtis*/sugar mills). In fact, an agricultural price policy itself represents an attempt to escape from the uncertainties and distortions of the so called 'open market'.

The inter-crop parity index reflects the relative positions of various agricultural products and the rates at which these are exchanged. Their main utility lies in monitoring the use of scarce resources for competing crops and calculating optimal resource allocation.

World prices are relevant in the case of export commodities or those commodities which are partly supplied from abroad. But world markets are not equally competitive for all commodities. Their use is further restricted by the fact that while a certain product and some of the inputs (for example, pesticides and fertilizers) may have relevance to world market conditions, major elements in the cost structure (for example, canal water and labour) may have no linkage.

Appendix 5.4

A Bumper Wheat Crop! Shouldn't we Celebrate?

Wheat harvesting is round the corner. It has in fact already started in southern parts of the country. It is likely to be a bumper crop. The production estimates show that country will cross the 24 million ton mark. It may actually produce an unprecedented and all time high 25 million ton. This will make us a self-sufficient country in this vitally important food crop. Shouldn't we celebrate this achievement? Policymakers are confused; traders perplexed and farmers worried. This is how the agriculture is in this overly globalized world, where less means more opportunities to earn and more can spell disaster.

Pakistan has almost always remained wheat-deficient. Both the acreage and the per acre yield of wheat have never been enough to feed its burgeoning population. Yield hovered around 400 kg per acre till 1967–68. The so called green revolution pushed it up. It now stands at 1160 kilogram, which is still less by the international standards. The average yield in the neighboring Indian Punjab is 1680 kg per acre. The area on which wheat is cultivated in Pakistan has also doubled over past 60 odd years, yet we walk the tight rope.

Perhaps low yield is less a result of 'technological backwardness' of our farmer than of lack of incentive for growing this crop. Wheat is a food security crop and farmers work against heavy odds to secure enough for the family. They cannot dare to co-opt it. But they do not also see any incentive in going beyond this point in a big way. Wheat trade is dominated by the government which is the biggest buyer of the home production and also enjoys the authority to set its price. Farmers hardly ever find the wheat Support Price attractive enough to invest more resources into this crop and produce the surplus required to feed the non-grower population of the country. Overall production in recent years has swung between 17 and 23 million ton. The government of Pakistan is a frequent visitor of wheat selling markets of the world. It fills the supply gap through expensive imports and has been lamented tor offering far more to farmers of other countries than it does to its own.

Wheat price in Pakistan has traditionally been lower than the international prices. It is set on the basis of calculations made by Agriculture Pricing Commission that claims it considers input costs, inflation rate, etc. It however always falls below the expectations of farmers and has remained stagnant for years. It remained Rs. 240 per 40kg for three consecutive years, 1997 to 99, and then Rs. 300 for next four years. It was in a way reflective of the political importance of wheat farmers in our economy.

International market on the other hand is more influenced by the demand and supply perceptions and the 'expert' forecasts of future. Commodity prices, including wheat, peaked to unprecedented high levels during last year alongside the prices of petroleum products. This weighed heavily against our government's reliance on wheat imports to fill the demand-supply gap. To spur home production it raised the wheat Support Price by a hefty 52 per cent. It moved from Rs. 425 per 40kg in 2006–07 to Rs. 625 in the next to Rs. 950 for the current. The farmers' response obviously has been overwhelming and they promised a bumper crop.

The international market however has pulled the rug from under the government. The wheat prices that rose hand in hand with petroleum have tumbled down. US wheat (FOB, Gulf) was quoted at $454 per ton in March 2008. It now stands at $241 and is expected to go down further as harvesting in South Asia starts. The government of Pakistan's announced price for purchase of local wheat translates into over $300 per ton. This makes it a unique year for the local price is higher than the international price for the first time ever. So who will buy wheat from Pakistani farmers at the government price?

Why the private buyers will keep off?

Private buyers will most likely keep out at least until it gets out of the government hands and the price crashes. It does not make good business sense to buy at higher rates when it is available at much lower price just across the Gulf. The much publicized smuggling to Afghanistan will also stop automatically. In fact we could see reverse-smuggling if the international prices fall further; that is cheap international wheat bought for Afghanistan may find its way to the silos of the government of Pakistan. Businessmen however will be keenly watching the government procurement drive and will wait for their chances of breaking deals at 'good rates'.

This leaves the government alone with the onerous task of fulfilling its promise of buying wheat at the announced price of Rs. 950 per 40kg. The government has exhibited the will to oblige but how much can it buy?

Punjab is not only the biggest producer of wheat in the country, it is the only surplus producing province. 8 in every 10 kilograms of wheat produced in the country come from this province. Punjab Food Department is the biggest wheat buyer. It comes under the provincial government. Pakistan Agricultural Storage and Supplies Corporation (PASSCO) is the other big buyer. This comes under the federal government.

The two departments set procurement targets each year and fail to achieve them many times as farmers prefer private buyers who offer premium over Support Price. But this time as the private buyers will abstain, it will be an advantage to win a procurement promise from the government buyers. The favour is likely to become the new currency of political patronage, Punjab is already divided into constituencies of the two main political parties, one ruling at the federal level and the other at the provincial and both refusing to come to terms with each other. Juxtaposition of political constituencies over the jurisdictions of the two procurement authorities may level a new battleground for the two political heavyweights.

Aside from the politics, the government departments do not have the capacity to pick the entire tradable surplus of wheat. The Punjab Food Department has set a 3.5 million ton procurement target, while media reports put the same for PASSCO at 1.5 million ton. Rs. 111 billion has been earmarked for Punjab Food Department and Rs. 40.5 billion for PASSCO, The amount is being released by a consortium of banks.

The government planners consider only 30 per cent of total production as the tradable surplus. It is a rule of thumb that needs verification. Even at this percentage the current season's bumper crop will produce a surplus that will be much more than the procurement targets of the government.

Who will buy this leftover? The private buyers will make a heyday when a gasping government will be sitting over its brimming silos.

Who will suffer most in a price crash?

Wheat is grown by all farmers irrespective of the size of their farm. According to Agriculture Censuses 2000, 8 in every 10 farming families of the country dedicate a portion of land to wheat cultivation. In Punjab, nine; NWFP, eight; Sindh, five; and in Balochistan, four in every 10 farmers grow wheat. In Rabi season almost 6 in every 10 cultivated acres of the country come under wheat cultivation. All the three provinces except Punjab are wheat deficient.

According to the last census around 69 per cent of Punjab families live in rural areas. Almost half of these (53 per cent) have some access to land. They either own a farm or have rented one on different terms. The rest are landless laborers or are attached to services and other sectors.

Access to land within these around 4 million owners and/or tenants is highly skewed. Average access of more than half of these (56 per cent) is just 2.1 acres. From the point of view of wheat production, the Punjab farmers can be divided into four broad categories. Here are the details:

1. Very small farmers
Around a third of Punjab farmers own on an average just 1.2 acres of land. They are more than 1.3 million in number and cover almost their entire area (1.1 acres) with wheat in Rabi season. Their share in total wheat production of the country is just 7.4 per cent. Their produce is hardly enough for the family itself. In fact, to ensure this, they have to harvest it themselves and avoid hiring labour for any other field job as well. This effectively means that they themselves consume their entire production and generate no surplus for trade.

2. Small farmers
A little more than half of Punjab fanners own (and/or rent) 5.8 acres on average. These around 2 million fanners cultivate wheat on 4 acres of their land. Their share in Punjab's total output is 47 per cent. After saving enough for family consumption and seed, they pay a considerable amount to groups of harvesters in kind and also oblige the service providers of the village called saipee. Since the small farmers form the biggest farming group, they are able to contribute 41 per cent in the province's entire tradable surplus of wheat.

3. Medium farmers
These over five hundred thousand farmers of Punjab have on an average access to 20.5 acres of land and dedicate over half (11.8 acres) of this to wheat. The second half is occupied by other Rabi crops most of which are grown for cash, The medium farmers produce 35.5 per cent of the province's entire wheat. As they too save tor family and seed and pay for services in kind, their share in tradable surplus of Punjab wheat stands at 45 per cent.

4. Big fanners
They are around 50 thousand in number and their landholding size on average is 86 acres. Ihcv cultivate wheat on less than half (45 per cent) of it. They produce ten per cent of Punjab's wheat and their share in tradable surplus, according to estimates, is around 14 per cent of the total surplus.

The government experts calculate the overall tradable surplus of wheat as 10 per cent of total production. We have serious reservations about it and our estimates put the surplus at much higher level. Even if the official rule of thumb is accepted, a bumper crop of 25 million ton will produce a tradable surplus of 7.5 million ton. In Punjab the collective procurement target of Punjab Food Department and PASSCO falls short of the expected tradable surplus. The departments will leave at least million ton with the farmers. The government can in fact achieve its procurement target by starting with buying the produce of big farmers and ending with that of the medium ones. Who will buy the surplus produced by the small farmers? The private parties cannot be expected to pay at par with the government in the present international scenario. These two million small farmers, who have grown wheat on four acres each, risk humiliation at the hands of private buyers. And we are fast running out of time. They grow almost half of the province's total wheat and a big loss in this year is bound to negatively affect their contribution the next season. According to careful estimates of cash input costs of current season, a Punjab farmer on an average has spent Rs. 628 on the production of 40kg wheat. This does not include land rent and self-labour.

What can be done?

The political government had for the first time ever dared to come face to face with the international market by pricing its wheat at par. The same however has upset the cart. We believe the government needs to tackle the issue on two fronts.

First and foremost it must act quickly to save its small farmers from destruction. The government departments are given purchase targets which are then distributed among several of their purchase centers. Performance of each is judged by what percentage of the target they have achieved. If we have to save the small wheat farmer, we need to ensure that the departments give priority to small producers. As is evident from the data, the smaller the farm size, the bigger is the share of wheat cultivation. Very small farmers, with an average farm size of 1.2 acres, sow wheat on 88 per cent of the land available to them, while big farmers, with an average access to 86 acres, cultivate wheat on less than half (45 per cent) of their land. This implies that the big and medium farmers grow other crops in the same season as well and are more able to sustain pressures on wheat, while for the small farmers this crop is a make or break matter. Moreover, small farmers with little clout are more vulnerable to maneuvering by private traders. Big farmers have storage facilities as well and they are not pushed to sell their produce then and there. They can wait

for the market to turn in their favour. Many times 'hoarding' by big farmers has caused the government difficulties in achieving its procurement targets. On the other hand cash-strapped small farmers have to sell their produce immediately after harvesting to keep their limited cash flow cycle intact. The government must ensure that small farmers are preferred by its departments in their procurement drive. It has to go beyond political rhetoric and develop a foolproof system. A crisis will be a big disappointment for farmers that will definitely reduce production in the coming season.

Secondly, the government needs to work with other governments of developing countries to look into the matters of international trade. Its high volatility is a cause of big concern for our small farmers. The temperamental global commodity market should not be taken as 'a natural phenomenon'. The governments of countries producing surplus for export unduly shield their farmers from the effects of market fluctuations. They ensure that their farmers get reasonable returns whatever way the market goes. This in fact encourages the market to waiver wildly as the risks of the primary producers are already effectively covered by their governments.

The governments need to effectively campaign against these policies of exporting countries to develop a rational global market. To discourage opportunistic traders from spoiling the announced procurement rate, the government shall levy duty on cheap wheat imports till at least the next harvesting season. It should ensure that international wheat is not available in the country cheaper than local wheat. This step will deprive the local traders the option of cheap imports and they might start buying local wheat at the government announced price. The government will have to be vigilant about the smuggling of wheat into Pakistan as well.

Appendix 5.5

Taxes on Land and Farm Income

Professor Mahmood Hasan Khan assesses the taxation and land revenue structure in Pakistan.

The federal government has made no serious attempt so far to improve the structure of direct taxes in agriculture, which at present are mainly in the form of land revenue (tax) assessed and collected by the provincial governments. The modest yield from land revenue has no relation to the increase in agricultural incomes and the general rise in the value of land since at least the mid-1970s. Direct taxes contribute about 23 per cent of the total tax revenue of the federal and provincial governments. In 1994–95, the land revenue of Rs. 1.1 billion was around 1.9 per cent of all direct taxes collected in the country, falling from 4.7 per cent in 1980–81.

What is even more interesting is that the ratio of land revenue to the value-added by crops has declined from 3 per cent in the 1950s to 0.58 per cent in 1980–81 and 0.45 per cent in 1994–95. Put it differently and the direct tax (land revenue) paid by farmers works out to Rs. 51 per hectare of cultivated land in 1995. Using a conservative figure of Rs. 3,000 per hectare for net crop income (after cultivation expenses), the average land tax is around 1.7 per cent of a farmer's income. The contribution of land revenue to the provincial taxes and provincial revenue has fallen significantly: land revenue used to contribute 30–55 per cent of the provincial taxes during the first 25 years of Pakistan (1947–1972), but has contributed 8–14 per cent in the last 25 years. Likewise, its contribution to the provincial revenue has decreased from 13–16 per cent to 6–11 per cent in the two periods.

The agriculture sector has been taxed heavily by the government's pricing policies and taxes on exports of agricultural products. These policies have (i) transferred resources from agriculture to the rest of the economy; (ii) generated revenue for the governments; and (iii) distorted the allocation of resources. Price subsidies on agricultural inputs, though substantial over time, have not altogether offset the burden of hidden taxes on producers. While there is some doubt if these subsidies have contributed to increased farm productivity, it is certain that most of them have been appropriated by large and influential farmers (landlords).

It is absolutely essential to maintain a favourable macroeconomic environment for agricultural producers if we want additional resources for investment in physical and social infrastructure to help improve the living standards of those whose incomes and jobs depend on agriculture. One should strongly oppose policies that penalize agricultural productivity, including perverse policies on output and input prices, exchange rate, regulation and control of internal and international trade, farm credit, and investment in physical infrastructure, research and extension. In the last five years, the burden of implicit taxes on agriculture has fallen substantially as a result of significant changes in prices and structural reforms.

We should here distinguish clearly between two issues: (i) the tax burden on the agriculture sector and (ii) the tax on personal income and wealth, irrespective of the sector in which they are produced or created. The first issue has been addressed gradually in that there has been substantial reduction in the tax burden on agricultural producers. The second issue of taxing agricultural income has, however, remained unresolved because of the effective political power of the large farmers and landlords. All kinds of excuses and deceptive arguments have been used by this group or by others on its behalf.

The case for increased reliance on direct taxes on actual agricultural income, or on presumed agricultural income (based on land according to its productivity) is quite persuasive on several grounds: indirect and hidden taxes on agriculture adversely affect and hurt the wrong people and send wrong signals on the question of efficient allocation of resources; the government revenue from direct taxes is small and has declined relative to other tax revenue and agricultural income; interpersonal equity (fairness) in (direct) taxation is not well served by differentiating incomes for tax purposes by sector or activity which produces income; and the tax base has to be expanded and made more flexible in order to reduce the fiscal deficit.

At present there are only two forms in which the government taxes landowners directly and includes the revenue in its budget: (i) wealth tax on agricultural land as immovable property and (ii) land revenue as a tax on land that generates income. The former is assessed and collected by the federal government and the latter by the provincial governments. In 1982–83, the military government introduced the ushr levy on (Sunni Muslim) landowners in lieu of the land revenue, but the paltry ushr revenue has not been part of the government's budget. *Land revenue is still almost the only direct tax revenue collected from landowners.*

The tax on movable and immovable wealth was introduced in 1963, but agricultural land was exempted in 1970 from this tax for those landowners whose only source of income was agriculture. The value of land for wealth tax was set at Rs. 10 per Produce Index Unit (PIU), which was used as a relative measure of productivity of land parcels in different locations to set the land claims of Muslim refugees from East Punjab in the late 1940s and then in the implementation of the Land Reform Acts of 1959, 1972, and 1977.

The federal government has raised the assessment value of land from Rs. 10 to Rs. 250 per PIU since 1990, although the PML Taxation Committee in 1990 was in favour of raising it to Rs. 400 per PIU which is the basis for acquiring loans from the banking system. In 1993, the second caretaker government removed the wealth tax exemption of 1970 for the landowners owing mainly to the pressure of donor agencies. However, following the recommendations of the Prime Minister's Task Force on Agriculture in 1994, the PPP-led government introduced several generous deductions to dilute the effect of wealth tax on large landowners. Further, the federal government has not accepted the suggestion by donors that the number of PIUs per hectare should be revised as a measure of the value (productive capacity) of land for wealth tax purposes. It is obvious that, without raising the

assessment value of land to Rs. 400 per PIU and the upward revision of PIUs per hectare, the wealth tax receipts from agricultural land would remain inconsequential.

The land revenue system in Pakistan has a very long history, but in its present form it was concretized by the British colonial government in the Punjab Land Revenue Act of 1887. This system now has no redeeming feature: it is a relic of the past developed under the absolutist, authoritarian, feudal, and colonial regimes and maintained by the political influence of landlords and rich farmers since 1947.

The land tax has no merit now because of the ad hoc changes made in the rates and exemptions in the last 25 years after the West Pakistan Land Revenue Act of 1967 which replaced the Punjab Land Revenue Act of 1887 was extended on a uniform basis to all parts of Pakistan.

It is no longer linked to the presumptive (income) capacity of the land one owns, hence it is highly inequitable between landowners and between those who earn their income from agriculture and others whose income is earned from other activities. In addition, the land revenue produces a very modest income for the provincial governments in spite of the ad hoc increases in the rates in 1983/84.

There is a long history of opposition to the idea of taxing agricultural incomes, going back to the times of the British rule in India. With the passage of the Income Tax Act of 1886 agriculture was to have only the land revenue system. The Income Tax Act of 1922 granted specific tax exemption to agricultural incomes, which is still available in Pakistan under the Income Tax Ordinance of 1979. In the decade after 1947, successive governments were able to avoid the issue of taxation on land and agricultural income. In the next fifteen years, in spite of the strong recommendations of the Taxation Enquiry Committee of 1959, Taxation and Tariffs Commission of 1964 and Agricultural Enquiry Commission of 1972–74, the federal government did not replace the land revenue system by a system of tax on agricultural income.

A major breakthrough on the issue of taxation of agricultural incomes was the enactment of the Finance (Supplementary) Act of 1977 by the PPP government. This act abolished the land revenue and replaced it by a uniform and universal income tax in the country in January 1977. However, before the PPP government could start the implementation of the Finance Act of 1977, the military government which took over power in July 1977 first suspended and then cancelled the act. The former tax exemption on agricultural income was restored in the Income Tax Ordinance of 1979.

In the 1980s, at least three 'expert' bodies—National Taxation Reform Commission in 1986, National Commission on Agriculture in 1988 and the Committee of Experts on Taxation of Agricultural Incomes in 1989—examined the question of changes in direct taxes on agriculture, including land revenue, ushr, and income tax. The majority view was against introducing a tax on agricultural income mainly on the ground that the federal government was not empowered to legislate on matters falling in the provincial jurisdiction, except in a State of Emergency under Article 232 of the Constitution. They emphasized the need to improve the assessment and collection of land revenue and ushr, but without specifying the measures for implementation.

A minor policy reform with respect to agricultural income was introduced by the federal government in the Finance Ordinance of 1988. It amended the Income Tax Ordinance of 1979 to include agricultural income (if any) in the 'chargeable income' for determining the tax rate for non-agricultural incomes. This so called clubbing formula, introduced with the federal budget of 1988-89, has had no major impact on tax evasion and the income tax revenue. At the end of 1990, the PML government appointed a taxation committee, which was in favour of a tax on agricultural income, but it repeated the excuse earlier made by the three expert committees in 1986, 1988, and 1989. So the committee recommended that the federal government should redefine the concept of agricultural income by excluding the rental part received by landowners and incomes earned from orchards, livestock, and poultry farms. However, the PML government took no action on this recommendation.

The persistently high fiscal deficit and the pressure of the international donor community since the early 1990s have moved up the issue of reforming the land revenue system on the government's policy agenda in Pakistan. The caretaker government after the dismissal of the PML government in July 1993 acted on two fronts in September–October 1993. First, it removed the 1970 exemption for agricultural land for wealth tax purposes. Second, it issued ordinances in all provinces to introduce a flat tax rate of Rs. 2 per PIU on all landholdings above 4,000 PIUs to replace the existing land revenue. In February 1994, the newly elected PPP government enacted a somewhat watered-down version of the Wealth Tax (Amendment) Ordinance to justify the changes in the original legislation.

The elected provincial governments, however, did not follow up on the provincial tax ordinances on presumed agricultural income (based on PIUs) issued by the caretaker government in September–October 1993. The provincial assemblies of the NWFP and Balochistan have enacted the land tax legislation, introducing a graduated scale of tax on presumptive income expressed in rupees per PIU. However, the two provincial governments have apparently not started the implementation process. The provincial governments in the Punjab and Sindh have been dragging their feet and taken no concrete action to legislate and implement the new tax system on presumed income based on even unrevised PIUs per hectare.

At least two major steps are required immediately: (i) abolition of the current system of land revenue assessment and (ii) revision of the number of PIUs per hectare in all provinces, based on the existing productive capacity of agricultural land. If the presumed income tax on land has to serve as a fair measure of taxation, a source of increased government revenue to meet the development needs of the rural people, then the provincial governments must consider increasing and graduating the flat tax rate of Rs. 2 per PIU and reducing the basic exemption for the individual landholding in terms of the revised number of PIUs per hectare equivalent to no more than five hectares irrigated.

Appendix 5.6

Getting the Policies Right in Pakistan's Agriculture

In another article, Prof. Mahmood Hasan Khan examines the key problems that face Pakistan's economy.

The economy's vulnerability to the performance of agriculture is based on its contribution to the supply of food and raw material, employment, and export earnings. These facts are well documented and need no further comment. What is, perhaps, less obvious is the (increasing?) burden on agricultural imports on the economy. The annual import bill on account of wheat, edible oils, sugar, pulses, and milk and its products is between $1.2 and $1.8 billion or around 15–18 per cent of the value of all imports. A high proportion of the food import bill is for edible oils ($800–900 million) and the rest for wheat and sugar.

Pakistan is importing this year probably 2.5 million metric tons or about 15 per cent of its expected wheat output. Perhaps a more distressing aspect of food security is that a sizable part of the supply of edible oil products, wheat, wheat-flour, and sugar find their way into the markets of neighbouring countries, thanks largely to price differentials and the low cost of these transactions to participants.

It is also well-known that much of the progress in agricultural production has come from the increased quantity of resources (inputs) and not from their increased efficiency (productivity). For instance, crop yields in Pakistan are among the lowest in the world, but mercifully have potential for significant increase. There is considerable evidence of waste of the key production resources, water and land, in most agricultural areas. Experts tell us the deterioration in the physical integrity of the irrigation and drainage system and quality of soils has become perhaps the single most important threat to the sustainability of agricultural growth in Pakistan.

Inadequate public investment, high cost of maintenance, and wrong-headed price policies have been rightly regarded as the major contributors to this problem.

A large part of the explanation for low productivity and waste of resources has to do with the rights to land and water and the state policies affecting incentives for a profitable agriculture. Successive governments have done either too little in areas that could significantly enhance agricultural production, or too much in others that have significantly debilitated the agriculture industry in Pakistan. Numerous committees/task forces/commissions—at least four since 1988—have reported on the problems of agriculture and made policy recommendations.

Constraints on agriculture go beyond the issue of price adjustments; they include structural and institutional problems.

There are clearly four policy areas that have a direct impact on the productivity and profitability of agriculture in Pakistan: (1) control of and access to (good) agricultural land; (2) access to and (efficient) use of irrigation water; (3) market structures for and prices of inputs and outputs; and (4) availability of public goods, including physical infrastructure and the support system of agricultural research and extension.

The idea of land reforms in Pakistan evokes little interest and much hostility, although it is at the heart of the problem of control and access to agricultural land. Property rights in land—or the responsibility to use it—need to be defined and protected to increase efficiency and check unfairness. The existing system of land titles is in a mess.

One has simply to look at the land records and the massive volume of intra-family and inter-family litigation for rights in land. The landlord-tenant contracts are more messy both in their written and verbal forms. In practice, they depend mainly on the power of one of the parties. The government's resources and efforts should focus on improving land titles and tenancy contracts with quick and fair dispensation of justice in disputes. The land revenue machinery, including revenue courts, is bloated in numbers but grossly inadequate in its effectiveness.

Prices

The access to water and its efficient use for agriculture is no less important in Pakistan. The existing irrigation system has almost no redeeming feature: rampant rent-seeking and neglect of the irrigation infrastructure are certainly its two most costly manifestations. An apparent paradox is that canal water is grossly underpriced from society's point of view and grossly overpriced from the viewpoint of the water user. It is, however, quickly resolved by looking at the rent-seeking system. On the surface, the case for an autonomous (private sector) irrigation authority is quite strong, but some of the underlying assumptions for its success seem dubious. The experience of the Water Users Association (WUAs) so far has not been encouraging, hence the problems associated with the On-Farm Water Management (OFWM) projects throughout the Indus Basin. The growth of genuine (participatory) organizations of farmers (water users) requires a socio-economic environment that the existing land system cannot provide. The proposed (autonomous) water utilities may turn out to be as serious a bottleneck to agricultural growth as the existing irrigation system has been. The water problem has to be resolved at the national level as well in terms of disputes between provinces on their 'fair' shares and 'leakages' experienced at critical times in each crop search.

Prices are (or can be) very strong signals for allocation of resources and profitability of the individual enterprise (farm). I am entirely in favour of price liberalization for both outputs and inputs, but policymakers have to take into account some of the side-effects such as redistribution of welfare (income) in the society. We are told almost ad nauseam that farmers want and should get 'fair' prices for their outputs, which the present price support system does not allow. The trade-off is that they may have to accommodate greater seasonal variability in prices. Governments and financial institutions can assist the private sector in developing storage systems that can stabilize prices.

The existing price support and procurement system should be abolished and support should be extended to private marketing channels for greater competition and investment in the distribution network for commodities. Consumers can and

should be protected by targeted (price or income) subsidies. Generalized consumer subsidies on wheat flour, sugar, and edible oils are a major source of cross-frontier trade or smuggling. In this regard, one should also seriously question the wisdom of maintaining the rent-seeking bureaucracy in the provincial food departments and a variety of parastatals at the federal and provincial levels. Is this really not a very costly way of providing subsidy to urban residents?

Subsidies

The case for price subsidy on agricultural inputs has never been too strong or persuasive since its co called incentive effect is more than offset by (i) waste and (ii) unfair distribution of benefits. The experience of subsidized credit is by far the best case to make this point. Targeted subsidies combined with greater access to credit for smaller farmers and rural entrepreneurs are the answer. Public sector financial institutions have proved to be a disaster since their activities have been dominated by political and not market forces. Innovative credit arrangements between private financial institutions and small-scale borrowers have to be expanded, particularly in those areas in which viable farmers (water users) organizations can develop. In some of the NGO-supported rural development programmes, this has already happened. Imported inputs, particularly machinery, should neither be taxed too heavily nor subsidized. Reduced customs duties on exports and imports seem to be the most reasonable approach to take.

There is finally the role of the government in building and strengthening the physical infrastructure and agricultural support services. Public investment in the irrigation, drainage, and road systems can have reasonably high rates of return provided the infrastructure (i) is based on good design and responds to the needs of people in different areas and (ii) has a reasonable cost recovery system. So far both of these aspects have been grossly neglected. Public investment in agricultural research and extension services can yield even higher returns.

However, the existing national and provincial systems must be restructured. The research system has to be brought closer to where the problems are and integrated with the delivery system to reach the intended beneficiaries. The army of front-line extension workers (field assistants and others) should be replaced by localized adaptive research outfits (establishments) to act as the meeting point for suppliers and recipients of technologies. In fact, a large part of the extension services can be done through these entities in collaboration with private sector companies and farmers (village) organizations. The cost saving from a significantly reduced size of the extension bureaucracy can be used to improve the research-based delivery system and rural education.

Governments are not being asked to do less but do things differently. Get your hands out where they tend to stifle economic activity and exacerbate income inequality and concentrate on policies—structural and institutional reforms included—and investment that contribute to economic growth and alleviate rural poverty.

May I add that a vibrant and productive agriculture will also (a) neutralize the oft-repeated arguments of the farm lobby against taxation of the incomes of the rich (large) farmers and landlords and (b) yield substantial tax revenue for public investment in the agriculture sector itself.

Part 2

Industry and Trade

There is a general belief amongst economists, policymakers, and the general public that industrialization implies economic growth and development. Unless countries industrialize, the assumption goes, they will continue to remain un- or underdeveloped. The progress of countries like South Korea, Taiwan, and other East and South-East Asian countries, which used to be called the Newly Industrialized Countries (NICs), only endorses that view. The first three chapters of this part of the book examine the process of development in industry in Pakistan, from the early days when very little existed. The extraordinary growth in industry in the 1950s and 1960s suggested that Pakistan might be one of the very few countries at that time which would join the developed world. However, much of the growth that had taken place in the first two decades soon unravelled, with growing income and regional inequalities, resulting in the separation of East Pakistan.

Pakistan after 1971 was a new country in many respects, not least because of the industrial and economic policies followed between 1972 and 1977. The role of the public sector was increased substantially and the economy, for numerous reasons, did not do as well as it had in the first two decades. However, as the discussion shows, most claims that the early 1970s were a disaster are factually incorrect. Just as much as there was a change in economic policy in the early 1970s, in the 1980s, too, there was another shift, in many ways similar to that of the earlier period, but also influenced by the new world order of globalization, privatization, openness, and neo-liberal economic policies. The Structural Adjustment Programme sponsored by the IMF and the World Bank determined much of what happened regarding industrial policy in Pakistan.

Chapter 8 evaluates the key issues in the industrial sector in Pakistan, and questions most of the myths that have been perpetuated over the last few decades. The claims that Pakistan's industry has been severely inefficient are not supported by the evidence. Many of the accusations made about the trade regime causing inefficient import substituting industrialization were also found to be false. Moreover, the claim that the public sector, too, was wasteful and inefficient in the past, is not borne out by the facts. These chapters offer a reinterpretation of the industrial and trade process in Pakistan, arguing that although there are problems in the industrial and trade sectors, many of the allegations made in the past, have been grossly exaggerated.

However, one must also add, that in 2013, Pakistan's industrial sector faced huge problems and extraordinary difficulties. The power crisis over the last five years and the consequences of the War on Terror, and other issues, have caused Pakistan's investment rate to collapse to its lowest level in many decades. Some of these issues are discussed in Chapter 8.

6 The Process of Industrialization in Pakistan I: 1947–77

For a region that was considered to be the Indian subcontinent's economic backwater at the time of partition, Pakistan's industrial and economic growth performance, at least up to the late 1960s, was phenomenal. Pakistan was considered a model developing country in the 1960s and enjoyed growth rates of gross domestic product (GDP) of over 6.7 per cent during the decade. This, in a country that was considered to be 'an economic wreck [with] serious social unrest rising'[1] as reported by the influential *TIME* magazine in 1947. Gustav Papanek, a professor from Harvard University, who played an important role as adviser to the Pakistan Planning Commission between 1954 and 1960, summarized the perception most observers had of Pakistan:

> At independence, Pakistan—simultaneously created and disrupted by the partition of British India—was widely considered an economic monstrosity. The country was among the poorest in the world and had no industries to speak of, almost no industrial raw materials, no significant industrial or commercial groups. It was difficult to see how Pakistan's economy could grow more rapidly than its population. Economic chaos and political disintegration seemed more likely. The 1950s were a period of apparent stagnation and mounting economic problems, when early dire predictions seemed to be fulfilled.[2]

The metamorphosis over a few years confounded all the prophets of doom who had predicted total anarchy in, and annihilation of, the country. By the mid-1960s the tone of dismay had changed considerably, and the international media had this to say about Pakistan: 'Pakistan may be on its way toward an economic milestone that so far has been reached by only one other populous country, the United States',[3] and 'the survival and development of Pakistan is one of the most remarkable examples of state and nation building in the post-war period'.[4]

This is the first of two chapters in which we examine Pakistan's industrial performance since 1947. The thirty-year period covered in this chapter consists of three very distinct, albeit interconnected, phases in industrial and economic policy. The first phase is the period 1947–58, when the foundations for the future years were laid. This was a period of huge change in the demographic make-up of the country, as well as in the political sphere, where governments were changed frequently.

The mere fact that the government had to deal with a refugee/migrant influx of about 7 million into West Pakistan (about 20 per cent of the entire population) was itself a massive responsibility and task. Add to that the fear of being taken over by India, and the lack of an industrial base or a skilled labour force, and we do indeed have every reason to believe the prophets of doom. However, Pakistan, despite heavy odds, did manage growth rates of GDP of more than 3 per cent per annum in the earlier years. In the first main section of this chapter we examine how commercial and foreign exchange policies helped guide the economy on its path. This phase was a classical, and fairly successful, implementation of import substituting industrialization (ISI).

There was a continuation of these economic policies, at least in general direction and principle, during the second period between 1958 and 1968, under the leadership of Ayub Khan. Growth rates continued to impress, and a substantial industrial and economic base was established. However, there were major differences between the two periods, not least regarding political control and stability. In contrast to the confusion and frequent changes in government in the first decade, the second decade represented a period of political stability, authoritarianism, and bureaucratic control. The political situation under Ayub Khan was probably a key determinant of the economic performance of the country, both positive and negative. When the Ayub Khan government was celebrating its ten years in office and calling it the 'Decade of Development', unrest in both West and East Pakistan was identifying the failure of the regime by the way it had contributed to income and regional disparities. Most observers have claimed that the overall assessment of the ten years of Ayub Khan must be mostly negative, and that this regime was more a failure than a success. Some have even called Ayub Khan's ten years the 'Controversial Sixties'. Unlike most analysts, we will argue that the Ayub Khan era was in fact highly progressive and dynamic, and that despite some negative consequences of its economic strategy, it was overall a resounding success.

The Zulfikar Ali Bhutto regime, which largely emerged out of the contradictions and conflicts under Ayub, was very different from the regimes of the past. Pakistan's circumstances were very different in December 1971 when Bhutto took over than they had been in the previous twenty-four years. A very clear break with the past was represented by the fact that the more populous eastern wing of the country had emerged as an independent nation. Criticism of the performance of the Bhutto regime has been particularly harsh and there is a general impression that this period was Pakistan's 'worst' period economically. However, here

as in the case of the Ayub Khan period, we re-examine the evidence and the issues, and reach somewhat different conclusions. We argue that, while some of Bhutto's economic policies may have had negative repercussions on the economy, the five-and-a-half-year period probably also had Pakistan's worst share of luck. The 'bad luck' factor between 1972 and 1977, when Zulfikar Ali Bhutto was in power, contributed significantly to the poor performance of the economy.

The period since 1977, from the fall of Zulfikar Ali Bhutto until the present, once again has a continuous theme, which is discussed separately in the next chapter. Just as a major break came about in the evolution and development of Pakistan in 1971, so the period from about 1977 to the early 1980s forms a different development pattern.

In this chapter, we take a look at the performance of Pakistan's economy, with particular emphasis on the industrial sector, in the period 1947–77. We examine data, look at events, and discuss policy issues that were important in determining the success and failure of that performance. Although there is some discussion of the role of the state and of political and institutional factors in determining economic strategy, policy, and outcomes, for the most part, we reserve our comments on the role of the state and political and institutional factors for a later chapter. In Chapter 19, we synthesize the crucial link between these apparently independent and unique factors—the state, institutions, classes, strategy—and examine economic development in a more realistic and holistic context, distant from the factual and largely empirical nature of this chapter.

6.1 1947–58: Exchange Rates, Trade Policies, and Import Substituting Industrialization[5]

Very soon after independence, the Pakistan government acknowledged the precarious nature of the base of Pakistan's economy and identified areas and strategies that would need to be given urgent consideration. In its Statement of Industrial Policy of April 1948, it stated:

> The most striking feature of Pakistan's present economy is the marked contrast between its vast natural resources and its extreme industrial backwardness. A country producing nearly 75 per cent of the world's production of jute does not possess a single jute mill. There is an annual production of over 15 lac [1.5 million] bales of good quality cotton, but very few textile mills to utilize it. There is an abundant production of hides and skins, wool, sugar cane, and tobacco—to name a few of the important products—but Pakistan's considerable resources in minerals, petroleum, and power remain as yet untapped. In laying down any policy of industrialization, note has to be taken of these deficiencies and handicaps, and a concerted effort made to overcome them.[6]

On the basis of this assessment, the government felt that Pakistan would need to

> seek, in the first place, to manufacture in its own territories, the products of its raw materials, in particular jute, cotton, hides, and skins, etc. for which there is an assured market whether at home or abroad. At the same time, to meet the requirements of the home market, efforts will be made to develop consumer-goods industries for which Pakistan is at present dependent on outside sources.[7]

The result of these objectives was that between 1949 and 1958 the growth rate of industry in Pakistan was amongst the most rapid for any country in the world. In united Pakistan, large-scale manufacturing grew at a phenomenal 23.6 per cent between 1949 and 1954, and afterwards, by the still very impressive 9.3 per cent up to 1960. The investment rate more than doubled during the 1950s, even though there was no increase in per capita income in that decade—in united Pakistan, GNP per capita grew on average by only 0.2 per cent between 1949 and 1954, and at zero per cent in the next five years.[8,9] In West Pakistan the growth rates were even more impressive, with large-scale manufacturing growing at 19.1 per cent between 1949 and 1958, and per capita income increasing by 6.97 per cent in the same period.[10] The main feature of the 1950s was the establishment and expansion of the large-scale manufacturing sector, which ranged from a high annual growth rate of 28.7 per cent in 1953/4 to a (still high) low of 4.9 per cent in 1957/8. Although starting from a non-existent base, and against all odds, Pakistan achieved very impressive rates of growth in its first decade (see Table 6.1).

With industry growing at high rates, there was a reverse picture in the agricultural sector, which only once in this period achieved double-digit growth rates. This is also the period when agriculture suffered negative growth rates in some years. Agriculture stagnated to the extent that its growth was not even enough to cope with the growth in population, resulting in a fall in per capita consumption of food grain and the need to import food as well.[11] In the mid-1950s, as much as 65 per cent of the civilian labour force was employed in agriculture and more than 75 per cent of the population lived in rural areas. Hence, a low growth rate in agriculture meant that the potential market for the growing manufacturing sector was also stagnant, restricting further growth in the manufacturing sector. Gustav Papanek has argued that 'agriculture was the sick man of economic development in Pakistan during the 1950s. A stagnant agriculture in a predominantly agricultural economy meant a slowly growing economy.'[12] As we will show, the policies that were adopted in this period had a marked anti-agricultural bias and the terms of trade between agriculture and industry were heavily biased against the former (see Table 6.2). In fact, Stephen R. Lewis argues that 'the major impact of economic policy in the 1950s was to transfer income away from agriculture and from urban consumers, and to the new and rapidly growing manufacturing sector'.[13] Let us now turn to some of the tools and mechanisms which influenced investment and economic development in the first decade.

6.1.1 The Impact of the Exchange Rate

Before the partition of the subcontinent, the area constituting Pakistan was the bread-basket of India. The areas that became Pakistan were net importers of industrial goods from India and produced agricultural commodities, such as cotton, wheat, and jute. After independence, a customs union between India and Pakistan existed through the use of a common currency, but this was broken up in 1949. The same year also saw the Government of Pakistan taking one of its most important decisions, which had a vital impact on industrial development in the country.

In September 1949, the pound sterling was devalued, as were the currencies of numerous countries including that of India, Pakistan's main trading partner. Viqar Ahmed and Rashid Amjad argue that 'the reason why the Pakistan government did not devalue its own currency at that moment is one of the most controversial questions of the period and the genesis of the pro-industrial bias in government policy in many ways can be traced back to this decision'.[14] One reason why this decision was taken was to announce to the world that Pakistan was an independent country and did not mimic Indian economic policy. Other reasons were to continue to sell raw jute to India (since Pakistan had no jute mills) at a now higher price, and to be able to import machinery and capital goods at a cheaper price. However, India punished the newly-born Pakistan by suspending trade between the two countries and refusing to accept Pakistan's independent stand. The Pakistani government imposed some controls on imports and exports in order to manage trade with countries that had devalued, as their imports were now cheaper. By not devaluing, the interests of Pakistan's exportable raw materials remained protected.

Pakistan was a monopoly exporter of jute, mainly to India, and hence gambled on the presumption that by not devaluing it would reap additional profits from the higher price of jute. In 1948/9, India imported 55.8 per cent of Pakistan's exports, but all such exports were suspended in September 1949. The consequences of the Indian retaliation could have been quite catastrophic for Pakistan's economy: either Pakistan would have been forced to devalue, as was the motive for India's trade suspension, or Pakistan would need to hurriedly find alternative markets for its exports. Neither decision was easy. However, Pakistan's luck changed for the better, as it has done on so many occasions, with positive effects for the economy.

The Korean War broke out in June 1950, and there was a fear that it might trigger off World War Three. Countries began stockpiling and storing raw materials, and as demand for them increased, so did their price. Jute and cotton were both in heavy demand, and Pakistan was able to make spectacular profits on its exports. Not only that, but demand was worldwide—Pakistan's traditional markets, India and

Britain, now no longer reigned supreme as Pakistan was able to diversify into new areas. Import controls that had been imposed only a few months before were again liberalized after the Korean War began. India also recognized Pakistan's new exchange rate, and trade was resumed after a suspension of eighteen months, but on a smaller scale than earlier.[15] The decision not to devalue had paid off.

The Korean boom lasted from 1950 to 1952, but by mid-1951 world prices of raw materials began to decline and export earnings also saw a decrease. There were clear signs that the market was heading for a recession, but Pakistan was too slow to react, and policies continued as if nothing had changed. Since Pakistan's exchange rate was still high compared to its trading partners which had devalued in 1949, after the Korean boom in 1952 there were expectations of a devaluation. In 1952 jute and cotton prices fell, as did export earnings, and Pakistan was facing a serious balance of payments crisis and sharply falling reserves. As it did in 1949, the government decided not to devalue and instead imposed very strict exchange controls and a set of physical controls on imports and exports. As Lewis shows, 'tariffs were maintained, but they were not the major determinant of prices of import composition. Export taxes on jute and cotton were raised during the Korean war, and were lowered somewhat following the fall in prices. Exporters of such commodities received low rupee prices for their goods both because the currency was devalued and because of the export taxes'.[16] The probable reason for not devaluing in 1952 despite a deterioration in the balance of payments was that capital goods were now needed to start the process of industrialization and a devaluation would have raised their prices. Hence, the government resorted to the imposition of controls instead.

The decision not to devalue may, with hindsight, have been the critical decision that started Pakistan on the road to industrial and economic development. Since industry was non-existent in the earlier years, international trade was the main sector where large profits could have been made. The Korean War export boom resulted in traders and merchants amassing considerable amounts of wealth. Trading was much more profitable than industry during the Korean boom. Viqar Ahmed and Rashid Amjad make the pertinent point that 'the favourable conditions for the conversion of merchant capital into industrial capital were the result of another important economic event related to the Korean war: the collapsed prices of raw materials after the end of the war'.[17] With controls imposed on imports, especially on consumer goods, 'the prices of these goods increased sharply in the domestic market which changed the terms of trade in favour of industry and against agriculture. This led to a sharp increase in the profitability of the industrial sector, and in comparison with the other sectors including trading, industry now became the most attractive sector.'[18] Hence, traders with their amassed wealth converted merchant capital into industrial capital and so began the process of industrialization in Pakistan. Although one study has argued that it was 'practical exigencies rather than conscious policy [that] provided the initial diversion of investible resources towards industry',[19] Stephen Lewis makes the essential point that 'government policy was not neutral, however, but decidedly favoured industrialization, particularly the decision not to devalue'.[20] Moreover, Lewis argues that, once the import licensing scheme was under way, here too conscious decisions were taken about the direction that the process of industrialization should take (see following sections).

6.1.2 The Trade Policy Regime[21]

Once the industrialization process had begun after merchant capital moved into industry, and after the collapse of the Korean boom in 1952, when falling export prices caused the balance of payments position to deteriorate, controls and restrictions were imposed on trade, having a substantial impact on the ensuing industrialization process. As Lewis argues, 'from 1953–64 virtually all imports into Pakistan were regulated by some form of quantitative controls'.[22] The trade policy adopted by Pakistan 'had three major aspects: (i) overvaluation of the rupee relative to other countries, (ii) use of quantitative controls on imports to regulate the level and composition of imported goods, and (iii) a highly differentiated structure of tariffs on imports, and export taxes on the two principal agricultural exports: jute and cotton'.[23]

The government began to favour tariff protection as a means of promoting industrialization. It wanted a cascaded tariff structure, with lower tariffs on intermediate and capital goods, tight controls over the import of luxuries, controls on other consumer goods, and easier access to capital goods and industrial raw materials. Table 6.3 shows the cascading nature of tariffs imposed in the late 1950s. However, despite the high prevalence of tariffs, Lewis makes the point that 'while the tariff structure played some role in directing resources in Pakistan, *that role was a relatively minor one*. . . . The principal determinant of the structure of imports and the set of domestic relative prices was the import licensing system.'[24] Licensing was used explicitly as a protective or exchange-saving device.

In assessing the role of tariffs, compared to that of quantitative measures, Lewis's conclusions are clear:

> It is clear that tariffs and indirect taxes played relatively minor roles in directing resource allocation, even when compared with other policy variables. Direct quantitative controls were dominant in setting prices and incentives. Through their substantial impact on relative prices, these controls speeded the process of structural change both by imposing the inducements to invest in various industries and by transferring substantial amounts of income to industrialists who reinvested them in the profitable manufacturing sector. The *directions* that industrial growth took were probably the same as those that would have been taken in the absence of major policy decisions due to market size and domestic resource availabilities. The policies adopted increased the *speed* with which the transformation of industrial structure occurred, both by increasing incentives and by increasing incomes in the hands of the 'saving' sector of the economy.[25]

6.1.3 The Consequences of Exchange Rate and Trade Policy for Industrialization

The consequences of the exchange rate and trade policies adopted by Pakistan should be fairly clear. Box 6.1 describes how such policies lead to a particular type of import substituting industrialization. The type of protective policy pursued in Pakistan can be put simply as follows: '(i) produce anything that can be reasonably produced domestically; (ii) once production has started domestically, ban imports of competing goods so as to save foreign exchange'.[26] More specifically,

> If the average tariffs were any guide to the differential incentive structure during the early years of industrialization, the very high incentives for domestic production were given to those items for which the domestic market was the

Box 6.1

How Import Substituting Industrialization (ISI) Works

The economic strategy that was in vogue in the 1950s and 1960s was import substituting industrialization. Stephen R. Lewis explains how it worked:

> A country beginning with virtually no productive capacity in manufacturing, and facing present or potential balance of payments problems, will be tempted to follow a policy of placing restrictions on the imports of non-essential goods, usually consumer goods, for two reasons. First, given the scarcity of foreign exchange, it feels that essential needs of established industries, or potential industries, should have priority. Second, there is some appeal to the idea that restricting the flow of imported consumer goods will release more resources for saving, since consumption would be restricted by lack of physical availability. The difficulty with this approach, as has been noted by numerous writers, is that it encourages the domestic production of consumer goods only, and it does so both because there is a relatively protected market for consumer goods and there is a relatively cheap source of imported capital goods and raw materials on which to base the production of the consumer goods. Industries are established which have heavy dependence on imported supplies, and there is little incentive to develop local capital goods and intermediate goods industries to serve them. In addition, since this sort of policy is usually a concomitant of maintaining an overvalued currency, the export of the newly produced consumer-oriented goods is discouraged; domestic resources are valued more highly in saving than in earning foreign exchange. As a result, after the process has gone on for some time, the country finds itself with productive capacity heavily dependent on imported sources of supply and with no new means of earning foreign exchange.

Source: Lewis, Stephen, *Economic Policy and Industrial Growth in Pakistan* (London: George Allen & Unwin Ltd, 1969), 38–9.

> smallest: luxury consumer goods and consumer durables. Imports of these goods were most heavily penalized, primarily as a measure to save foreign exchange. Essential and semi-luxury (or semi-essential) consumer goods, which included most of the basic mass-consumption items (food, cloth, kerosene, matches, soap, etc.) received more protection than raw materials for production of such goods. Only since 1959/60, after the first rush of industrialization was over, were the differential incentives given to broad-based consumption goods (particularly semi-luxuries) widened sharply. It is true throughout, however, that producer durables had low tariffs, and, if the classification system is right, the duties on raw materials for producer durables exceeded the duties on the goods themselves.[27]

Import substitution progressed easily and very rapidly in those industries that had the highest protection, i.e. consumption goods, and those that had cheap and ready access to domestically produced, primarily agricultural, raw materials, such as cotton, jute, and leather. Another reason why consumer goods grew is provided by Lewis. He argues that 'the size of the domestic market at Partition and well into the 1950s was decidedly larger for consumer goods than for most intermediate and investment related goods'.[28] These were also those industries in which Indian imports made a significant contribution to Pakistan's domestic market.

There is a tendency for some observers to suggest that much of what happened in the industrial and economic sphere in Pakistan in the 1950s was erratic and not thought through. However, as we have shown above, even the decision not to devalue seems to have had a clear logic behind it, although good luck did endorse that decision further. Similarly, the import licensing scheme also seemed to be a thought-out policy measure which affected relative prices and hence patterns of industrialization. The pattern of investment and import substitution influenced the decisions of the licensing authorities about what sorts of imports and, hence, what sort of industrial development should take place. Lewis agrees that the 'licensing system was largely a mirror of the decisions to invest in different industries'.[29]

6.1.4 The End Result

Since almost all capital goods and most non-agricultural industrial goods were imported, the state played a major role in determining the nature and structure of industry through the licensing system and tariff structure, and through the incentives it provided. Stephen Lewis summarizes the impact of these measures on trade as follows:

> The exceedingly rapid growth of modern manufacturing during the 1950s, amid a relatively stagnant economy, particularly in agriculture, was reflected in the decline of imports of some manufactured goods, the rise of those imports related to investment activity, the emergence of certain manufactured exports, the conversion from an export surplus to an import surplus in food grains, and the decline of agricultural exports that were used as raw materials by domestic industries. In the 1960s the changes in the structure of production were somewhat smaller, and in different directions due to the increased flows of aid-financed imports and the more rapid growth of such sectors as agriculture.[30]

The significant increase in exports was from the newly established manufacturing industries, mainly jute and cotton textiles, which replaced competing imports by the mid-1950s. Towards the end of the 1950s, Pakistan was in a position to produce export surpluses as well. In many ways, these results indicate the success of the first phase of the import substituting industrialization policy of the 1950s, where the emphasis was on consumer goods rather than on intermediate or capital goods. This strategy also rested on the government's preference for investment in those areas where foreign exchange could be saved regardless of cost, and its 'desire to produce domestically almost anything that technologically could be produced there'.[31]

Stephen R. Lewis estimates that the success of the import substituting strategy can be gauged by the fact that almost all the growth that took place in manufacturing between 1951 and 1955, and hence in overall growth, was due to import substitution. The increase in domestic demand was not a cause of growth up to 1954/5 and was only of consequence after 1960. The complete dominance of import substitution in the first half of the decade was reduced a little in the second half, but still accounted for over 20 per cent of growth of manufacturing output, with the newly established manufactured exports responsible for about 25 per cent.[32] Moreover, the trend in the first phase of import substituting industrialization was also showing a shift, as consumer goods industries, which accounted for about 70 per cent of manufacturing value added in 1954/5, contributed less than half of the growth after that period (Table 6.4).

While Pakistan's impressive growth rate in the 1950s was due to the fact that the country started with a low base in the first place, the other important factor was that, due to the restrictive measures enforced on the economy, profit rates in industry were very high. The government had very openly encouraged private sector initiative in economic growth, an encouragement to which the private sector responded enthusiastically. The annual returns on investment ranged from 50 to 100 per cent in the early 1950s, but dropped to between 20 and 50 per cent in the latter part of the decade. There were strong economic incentives to becoming an industrial entrepreneur, but Papanek notes that while 'high profits were strongly conducive to industrial investment . . . perhaps even more important were the strong disincentives to alternative activities. With the end of the Korean boom, international trade, and especially importing, suddenly became unattractive',[33] and therefore industrial development became a natural choice. Thus it was the lure of extraordinary profits and a lack of good alternatives that induced the process of industrialization.

The pattern of industrial development resulted 'inevitably', as Papanek argues, in a high degree of concentration. Most of the nascent industrialists were traders who had made

money in the Korean boom and were already well established and well-off. However, they had better possibilities for making more money and amassing further wealth given the high-profit, near-monopoly markets that were developing. Papanek shows that in 1950 there were 3,000 individual firms in Pakistan, but the concentration of wealth was so high that only seven individuals, families, or foreign corporations constituted 25 per cent of all private industrial assets in united Pakistan. Twenty-four units constituted nearly 50 per cent of all private industrial assets.[34]

While the development of the economy and of industry was private sector oriented, the institutions of the state did play an important role too. In the field of credit, the government was particularly significant. The Pakistan Industrial Credit and Investment Corporation (PICIC) and the Pakistan Industrial Finance Corporation (PIFCO) provided funds to the larger, more established firms which had adequate security and a high profit rate. PICIC provided nearly 'half of all its loans to a tiny group of leading industrialists'.[35] However, the role of both institutions was more important after the 1960s, and the links they made with industry show how the network of industry and finance in the private and public sector interacted (these issues are discussed in Chapter 19). The institution that played a more important role at this time was the Pakistan Industrial Development Corporation (PIDC), which 'pioneered in industries and areas which were neglected by private investors during the early period of industrialization'[36] and 'fulfilled an extremely useful function in supplementing private enterprise'.[37]

Although East Pakistan seceded from united Pakistan in 1971, the seeds for this process were sown long before. While Ayub Khan's decade is held responsible for fostering the economic decay and underdevelopment of East Pakistan, leading to the formation of Bangladesh, this is only part of the picture. In fact, it would be very unfair to hold the policies of Ayub's regime solely responsible for Pakistan's break-up, as many observers do. Even in the 1950s, strong biases in economic development had emerged, which were blatantly tilted against the eastern wing. For example, state institutions in the 1950s, such as PICIC and PIFCO, concentrated on industries in West Pakistan, while in 1958 about 66 per cent of the government's investment through PIDC was based in West Pakistan, which also received 62 per cent of foreign loans compared to the eastern wing's 38 per cent[38]. The cessation of trade between India and Pakistan in 1949 also had greater negative consequences for East Pakistan, as about 50 per cent of West Pakistan's trade and 80 per cent of East Pakistan's was with India. Table 6.5 shows that, in fact, West Pakistan had a continuous deficit in trade throughout the 1950s, while East Pakistan had a consistent surplus. The overall trade figures for united Pakistan were in surplus due to East Pakistan's contribution, mainly by exporting jute. This evidence shows very clearly that East Pakistan was instrumental in supporting the process of industrialization in (West) Pakistan. West Pakistan's development was built on a transfer of resources from the eastern wing, which got very little in return, and this process was initiated as early as the late 1940s and early 1950s.

Just as East Pakistan was neglected, so was the agricultural sector: Table 6.2 shows how the terms of trade developed against agriculture and in favour of industry in the 1950s. Viqar Ahmed and Rashid Amjad write that 'the initial accumulation of industrial capital had taken place as a result of the large tribute paid by the agricultural sector to the industrial sector and by the urban consumers. The former had supplied agricultural raw materials at cheap prices and had paid high prices for manufactured consumer goods in return'.[39] The devaluation in 1955 was meant to redress the balance against agricultural exports and occurred simultaneously with a shift in giving some priority to agriculture.

Despite some negative consequences of the economic policies pursued by the governments in Pakistan in the first decade, it would be fair to say that they initiated an era of industrial growth and development which laid the foundation for the Decade of Development between 1958 and 1968. On the basis of the criteria that were considered important at that time—in the 1950s, when import substituting industrialization was the received wisdom—Pakistan did very well for itself. Much of the criticism made of those policies forty years later (see Chapter 8) is quite unwarranted.

6.2 1958–68: The Decade of Development

There is little disagreement over the fact that the growth rates in agriculture, large-scale manufacturing and GDP showed astonishing trends over the ten years between 1958 and 1968. The disagreements exist over the nature and consequences of those growth rates and over an interpretation of the economic policies that formed what the government of the time called the 'Decade of Development' and what its critics have very mildly termed the 'Controversial Sixties'.[40] Viqar Ahmed and Rashid Amjad argue that

> this period of rapid economic growth, achieved mainly as a result of the policies pursued, generated a great deal of economic tensions. . . . Increasing disparities in regional income between the provinces, a concentration of industrial economic power, the failure of real wages to increase significantly, and a general belief of increasing income inequality, all contributed to the rejection of the Ayubian growth philosophy and strategy.[41]

We will examine the nature of these developments in the course of this section after looking at the facts regarding growth rates, the policies pursued and the consequences of those policies.

The impressive performance of the main sectors of the economy can best be gauged from Table 6.6. The high growth rates in large-scale manufacturing continued in the first few years of the Ayub regime with the average for the period 1960–5 rising to a phenomenal 16.9 per cent. Even after 1965, when there was a marked slowdown, growth rates in manufacturing still remained above to 10 per cent. In industry, it seems that the previous trends maintained during the 1950s continued well into the 1960s. Agriculture presents a marked improvement in the 1960s compared with the dismal situation in the 1950s. The reasons for this growth were the recognition in the late 1950s that the excessive pro-industrial bias was affecting agriculture very negatively and that a redress was necessary. Some steps were taken, but it was the Green Revolution (see Chapter 3) that was responsible for the very high growth rates of the late 1960s. For Papanek, 'the spurt in agricultural production was the main difference between the Pakistan of the 1950s and of the 1960s, as well as between Pakistan and other countries'.[42]

In the first half of the 1960s, overall investment had risen to over 18 per cent of the GNP, and savings had doubled between 1949 and 1965.

6.2.1 Trade Policy Directing Industrialization

Although there was a great deal of continuity between the 1950s and 1960s, hence the similar levels of growth and development, some critical steps were taken, especially in the trade and exchange rate policies that were the prime movers of the 1950s. The new regime of Ayub Khan disbanded many of the controls that had been imposed following the post-Korean War recession in 1952. In 1959 there was a fundamental reordering and change in the method of directing industrialization through trade policy, and a series of liberal policies were introduced which remained in effect till 1965.

The main emphasis of the new trade policy in 1959 shifted away from direct controls and towards indirect controls on imports and on domestic prices of other goods. As Lewis shows, 'a number of measures were taken in import licensing that made market forces more important in determining the commodity composition of imports and the distribution of ownerships of import licences'.[43] It was the Export Bonus Scheme (EBS) or the Bonus Voucher Scheme, launched in 1959, that was considered to be the key to the import liberalization process in Pakistan (see Box 6.2 for how the scheme worked). The scheme allowed a free market in the bonus vouchers for certain commodities. In addition, the earlier closed and selective import licensing scheme of the 1950s, which was based on the importer's ability to import during the Korean boom of 1950–2, was replaced in 1961 by the Open General Licence (OGL), which allowed newcomers to enter the trading sector. A large amount of foreign exchange was allocated to the OGL, and given the buoyant nature of trade and of the economy, the new traders made substantial profits and gains from possessing import licences. The most 'market friendly' change was the introduction of the 'Free List', which permitted the import of certain goods without any licence. The Free List was extended over time from four items to fifty in 1964. The tariff structure continued to be used as a signalling device, as it had been in the 1950s, but as Table 6.3 shows, the differentials in the tariff rate structure widened, with the rates for consumer goods rising much more than for other goods. The bias against producing machinery and equipment locally continued, as the import duty on these items was still the lowest, thus making it easier to import these goods rather than produce them at home.

The main reason why the government could be so generous in its import policy in the first half of the 1960s was critically linked to the availability of foreign aid, which increased from 2.5 per cent of GNP in the mid-1950s to 7 per cent of GNP in the mid-1960s.[44] In fact, according to an important Asian Development Bank study, the 'import liberalization which took place during the first half of the 1960s *would have been impossible without this large increase in aid*',[45] In 1965 the Free List suffered serious setbacks as foreign aid was curtailed, and due to the resulting foreign exchange squeeze, the import liberalization policies were abandoned and many new import controls were introduced. (See section 6.2.2 for more on the contribution of foreign aid in the 1960s.) As long as foreign exchange resources were available, largely through aid, the government was eager to follow a liberal import regime.

Box 6.2

The Bonus Voucher Scheme

One of the most controversial instruments adopted by Pakistan's managers of the economy was the Bonus Voucher or Export Bonus Scheme. Some writers have argued that this scheme was responsible for Pakistan going on the wrong industrialization track, while others believe that the scheme was largely responsible for Pakistan's high growth. This box explains how it worked.

> The Export Bonus Scheme which was introduced in 1959 was a flexible and fascinating device which was used both to subsidize exports and to allow a safety valve on imports, while maintaining the basic structure of import controls on the vast majority of imports and while maintaining at the same time the official exchange rate at its existing level. Under the Export Bonus Scheme, an exporter received, in addition to the amount of rupees converted at the official exchange rate, Bonus Vouchers equivalent to some percentage of his export earnings (the percentage varied from time to time and from commodity to commodity). The Bonus Voucher could be used to import any item from a list of importables that changed from time to time. At some times during the last decade, goods on the Bonus Voucher importable list overlapped with goods importable under other types of licence, and sometimes there was no overlap. The exporter could import items himself, or he could sell the Bonus Vouchers in an organized market, at which the Bonus Vouchers have sold at a consistent premium above their face value. In most years of the Scheme the premium on Bonus Vouchers has been stabilized at around 150 per cent of face value, the stabilization having been accomplished by additions to and subtractions from the list of importables and the list of exports eligible for Bonus Vouchers or the rate at which Bonus Vouchers were awarded for those exports.
>
> An example may be helpful at this point. An exporter sells \$100 worth of Pakistani goods abroad, the Bonus rate on the goods being 20 per cent, and the premium on Bonus Vouchers 150 per cent. The exporter receives Rs. 475 from the State Bank of Pakistan, as well as Bonus Vouchers with a face value of Rs. 95. The exporter then sells the Bonus Vouchers in the market for Rs. 142.50, which gives him total receipts for his exports of Rs. 617.50, or 30 per cent more than the official exchange rate. The rate of subsidy is easily computed on any item, since it is the rate at which Bonus Vouchers are awarded *times* the premium at which Bonus Vouchers are selling. For some items the extent of subsidy has reached 60 per cent of the f.o.b. value of exports. Bonus Vouchers were awarded to almost all manufacturing industries and to some non-traditional primary products such as fine rice and fish.
>
> On the import side, Bonus Vouchers acted as import licences, and at times when Bonus Vouchers sold at 150 per cent of face value, the cost of foreign exchange to importers was 150 per cent above, or two-and-a-half times, the official exchange rate. Tariffs and sales taxes on imports were added to the cost to importers, but were computed at the official exchange rate, not the Bonus Voucher exchange rate. The advantage of Bonus Vouchers from the point of view of importers was that it was possible to import items immediately, and the waiting period until the next shipping period was announced in accordance with the regular licensing system could be by-passed through the use of Bonus Vouchers. Thus, the Bonus Voucher system provided an excellent safety valve for those firms who might have run short of a critical spare part or raw material during a licensing period. A number of items of machinery and transport equipment were also imported under Bonus Vouchers, so that the initial fears, which were that Bonus Vouchers would simply provide more luxury consumption goods, did not materialize to the extent that many people had expected at the time of the introduction of the scheme.

Source: Lewis, Stephen, *Pakistan: Industrialization and Trade Policies* (London: George Allen and Unwin, 1970), 28–30.

The government's import licensing scheme was supposed to encourage the private sector to invest, just as the EBS was a means for exporters to acquire additional foreign exchange by exporting more. The exchange rate had been overvalued in the 1950s (and later as well), but the EBS compensated for that and boosted exports, especially of manufactured goods. The scheme transferred a subsidy to exports, and the exports of raw jute fell from 60 per cent of total exports in 1958 to 20 per cent in 1968/9, while the exports of cotton and jute textiles increased from 8.3 to 35 per cent in this period, and the exports of other manufactures increased ten-fold from 2 to 20 per cent. The EBS also had a positive impact on imports, making raw materials and machinery imports easier and cheaper. The Export Bonus Scheme was considered to be an innovative device helping both import substituting and export growth.[46] In 1965 Pakistan's manufactured exports were greater than the *combined* manufactured exports of South Korea, Turkey, Thailand, and Indonesia.[47] The main feature of the foreign exchange regime in the 1960s was that, with an overvalued exchange rate, it became cheaper to import industrial machinery, which resulted in low prices for agricultural inputs, while the EBS transferred subsidies to manufactured exports.

The impact of the EBS and the import licensing and liberalization strategy on industrial development was considered to be 'dramatic' by some observers. The Asian Development Bank study shows that large-scale manufacturing growth increased from 8 per cent per annum between 1955 and 1960, to 17 per cent between 1960 and 1965 in the Second Five-Year Plan. The controls reimposed following the foreign exchange and aid curtailment caused this growth to fall to about 10 per cent in the second half of the 1960s.[48]

An interesting outcome of these trade policies, as Stephen Lewis shows, is that in sharp contrast to the 1950s *none* of the growth in industry during the period of the Second

Five-Year Plan was due to import substitution—a remarkable transformation, indeed.[49] Instead, domestic demand and absorption were the dominant factors. As foreign aid had increased, so had imports, and even though manufacturing output grew at impressive rates due to the import policies and foreign resources, imports increased at a faster pace. Both industrial production and investment responded well to the liberalization of imports. The nature of import substituting industrialization had also changed over the years, shifting away from almost wholly the consumer goods industry to intermediate and capital goods. Table 6.7 shows the differences in the three sectors in the 1960s, and also shows that the growth rate was much higher in the first half of the decade than in the second half. The most interesting observation that can be made from Table 6.7 is that the growth in investment goods was by far the fastest of all sectors during the early 1960s. The reason, according to the Asian Bank, was that since this sector was most dependent on imported raw materials, it benefitted the most from import liberalization.[50] Another reason why import substitution slowed down was the EBS, which encouraged the export of manufactured goods. The share of exports in total consumer goods output rose from 15 per cent in 1959/60 to 45 per cent in 1969/70.[51] Meekal Ahmad evaluates the impact of the EBS on exports and argues that it 'compensated for the overvaluation of the domestic currency by introducing a series of multiple exchange rates depreciated in relation to the official exchange rate so that the profitability of exporting was brought more in line with the incentives for sales in the domestic market'.[52]

Asad Sayeed goes beyond looking at growth rates of industrial performance, as he feels these often hide the costs incurred in the process. Instead, he argues that 'productivity growth rates, especially total factor productivity growth (TFPG), is one measure which reveals the efficiency of factor use'[53] (see Box 6.3 for how to calculate TFPG). The growth rates in total factor productivity shown in Tables 6.8 and 6.9 reveal that Pakistan's growth rate of 5.06 per cent was far higher than many comparable countries, indicating 'both technological dynamism and dynamic allocative efficiency in a comparative perspective'.[54] This evidence only underlines the fact that growth in manufacturing was higher than in most other countries in the 1960s, and was highly efficient, as it came about due to improvements in the amount of output per unit input (see Box 6.3).

6.2.2 Foreign Aid, the Private Sector, and Inequalities

Gustav Papanek writes that 'foreign aid contributed *significantly* to Pakistan's growth, from the late 1950s; *without it, the rapid increase in development in the 1960s could not have been possible*'.[55] Keith Griffin felt that in the mid-1960s 'the entire social and economic system that had been built up, was heavily supported by and sustained through foreign assistance'.[56] Rashid Amjad argues that the 'explanation for the boom in private industrial investment in the first half of the sixties and its subsequent slowing down lies principally in the change in foreign aid inflows to the industrial sector

Box 6.3

How can Productivity Growth be Measured?

What is the Engine of Growth? Is it Education, Technological Improvement or Hard Work? Some answers:

> Asia's growth performance has been so spectacular and so sustained that it has been dubbed the East Asian Miracle in a study by no less an authority than the World Bank. But as miracles have true believers, so too must they have debunkers. To challenge the received wisdom that Asia has a magic formula for success, we have Prof. Paul Krugman of Stanford University, who states flatly that the miracle is based on 'perspiration rather than inspiration'. Krugman's argument, in which he relies heavily on empirical work by Prof. Alwyn Young of MIT and others, is very simple. He says that Asian growth has been driven by growth in inputs like labour and capital rather than by gains in efficiency. In this sense, East Asia is no different from other economies at similar stages in their development, like the Soviet Union in the 1960s and 1970s. Hence, the miracle is no miracle at all.

Introducing 'Growth Accounting'

Krugman makes his case by using a basic equation of 'growth accounting'. This is a technique which uses regression analysis to isolate and quantify contributions to economic growth. The equation is as follows:

GDP growth = growth in labour input + growth in capital input + total factor productivity (TFP)

The rationale behind this is simple. Economic growth comes about either through the application of more inputs or through a rise in output per unit input, i.e. improvements in TFP. The labour input variable captures all the influences that increase either the quantity or quality of labour used in the production process. These include growth in population, rising participation rates, growth in employment and improving levels of education and skills. The capital input variable reflects changes in the stock of physical capital used in production and is measured by spending on plant, machinery, equipment, roads, telecommunications, and so on. What is left is TFP which is a pure measure of efficiency, i.e. improvements in the amount of output per unit input. This comes from improvements in management and work organization and improvements and innovations in technology. Since it is very difficult to measure TFP directly, empirically it is derived as a residual in the growth equation. TFP is what is left after the contributions of labour and capital are determined and subtracted out.

in the sixties'.[57] In fact, he goes even further and says that

> the entire economic system which operated in Pakistan in the sixties was quite different from that suggested by earlier writers. It bore little resemblance to classical nineteenth-century capitalism (portrayed by writers like Papanek). On the other hand, the system did not fail because the capitalist class were no longer prepared to 'play the game' or had lost the desire to invest (as, for example, Nulty would make us believe). The system which operated in Pakistan came very close to being what we can term a 'Foreign Aid Dependent Regime' in which the mechanics of industrial growth were in one way or another made dependent on foreign aid inflows. Once these aid flows slowed down, the system, not being able to replace foreign aid with other forms of external finance like direct foreign investment, and without the peculiar boost to profitability associated with the local system for dispensing aid, found it difficult to sustain the earlier growth it had generated.[58]

These extracts and the discussion in the earlier sections show that Pakistan's growth in the 1960s, and the policies pursued (import liberalization, for example), were contingent upon the country receiving a substantial amount of foreign aid. Once the aid stopped, so did growth in the economy. And while foreign inflows mattered, the (unwritten) conditions to the aid made the role of the private sector paramount. Papanek, a firm believer in the leading role of capitalism and the private sector, argues that 'for ideological reasons, the United States, Germany, the World Bank, and others have been strong advocates of private enterprise. A country that caters to this preference is bound to profit.'[59] He considers Pakistan's industrial experience from the 1950s to the mid-1960s to be a success story of private enterprise, but the incentives that foreign aid generated were critical. Rashid Amjad argues that 'foreign aid played a crucial role in the creation of . . . favourable conditions and had a direct impact on the private sector'.[60] Thus, foreign aid in association with the private sector was the main instrument in Pakistan's economic growth in the 1960s. Interestingly enough, there was also an explanation of the economic development model of the 1960s which not only rested its premise on the leading role of the private sector, but also justified increasing inequalities. This was the Doctrine of Functional Inequality.

Ali Cheema explains the concept of Functional Inequality rather eloquently. He says that

Table 6.9
Total Factor Productivity in Manufacturing: Selected Countries

> this philosophy was part of Ayub Khan's Martial Law government's policy, and was the central pillar of the advice given to the Pakistan government by the Harvard Advisory Group. In simple terms the doctrine suggested that resources should be directed towards the industrial sector which has a higher propensity to save, and that agriculture and wages should bear the brunt of this transfer. The idea was that profits in the industrial sector should be raised giving the push towards growth which will result in automatically positive distributional consequences as development proceeds.[61]

Essentially this doctrine propagated the pursuit of what Papanek calls 'the social utility of greed'. The outcome was the concentration of wealth and income in the industrial sector (see Box 6.4).

Rashid Amjad's excellent work on private industrial investment in Pakistan documents and highlights the extent of that concentration. A dominant small group of monopoly houses had begun to emerge in the 1950s in the industrial sector, a trend which was accentuated in the 1960s. In 1970 there were 44 monopoly houses, which controlled about 77 per cent of gross fixed assets of all manufacturing companies listed on the Karachi Stock Exchange. These firms controlled about 35 per cent of all assets of the entire large-scale manufacturing sector and at the same time had close links with the financial sector. Seven of the seventeen Pakistani banks were under the direct control of the monopoly houses, accounting for 60 per cent of total deposits and 50 per cent of loans and advances. They had an extended network of interlocking directorates, where the board of directors of one company sat on the board of directors of others. Moreover, there were strong links between private industry and government financial institutions: between 1958 and 1970, 65 per cent of total loans disbursed by PICIC went to thirty-seven monopoly houses, with the largest thirteen of these accounting for about 70 per cent of these loans. Dr Mahbub ul Haq, a key supporter and architect of the Ayub government's Doctrine of Functional Inequality, revealed figures, as the Ayub regime was falling, of even greater concentration: he claimed that (the famous) twenty-two families controlled 66 per cent of industrial assets, 70 per cent of insurance, and 80 per cent of total banking assets. Rashid Amjad argues that while this claim was never substantiated, it nevertheless had a great deal of truth in it, and his own research does show very high concentration.[62]

While there was certainly economic concentration at one end of the wealth spectrum, there was also a general belief that income inequalities had increased during the 1960s and that there was no substantial increase in the level of real wages. The labour movement of 1968/9 was a major factor in the fall of Ayub Khan's regime, as it was fuelled by the perception that the fruits of growth had not trickled down to sections of society other than the industrialists. The strategy of Functional Inequality also gave low priority to the

Box 6.4

The Social Utility of Greed

Gustav Papanek argues that inequality leads to economic growth. He writes as follows:

> The problem of inequality exists, but its importance must be put in perspective. First of all, the inequalities in income contribute to the growth of the economy, which makes possible a real improvement for the lower-income groups. The concentration of income in industry facilitates the high savings which finance development. Allowing the more enterprising and wealthy peasants to sink tube wells is a major factor in expanding agricultural output. In turn, growth of the economy means cheaper cloth, cheaper food, and more adequate supplies for the bulk of the population. Great inequalities were necessary in order to create industry and industrialists; but to maintain industrial growth after the first 5 to 10 years does not require the same high rate of profit and therefore does not imply the same inequities. Greater equality during the early period at the cost of growth would probably have left the poorer groups in a worse position absolutely, though they would have been better off relatively. This argument holds true, however, only because inequalities in income result substantially in inequalities in savings, not in consumption. High incomes are more acceptable, politically and morally, because they are used chiefly for investment, rather than for conspicuous consumption.

Source: Papanek, Gustav, *Pakistan's Development: Social Goals and Private Incentives* (Cambridge, Mass.: Harvard University Press, 1967), 242–3.

social sectors such as education and health. Viqar Ahmed and Rashid Amjad argue that after the cut in foreign aid in 1965, with foreign exchange down and defence spending up, the ensuing economic crisis between 1965 and 1967 was a key cause of Ayub Khan's downfall. The sugar crisis of 1967/8 acted as a major trigger to a smouldering feeling of discontent. Prices had risen by 15 per cent in 1965/6 and 10 per cent in 1966/7, adding fuel to the fire. Along with these factors, there was what Viqar Ahmed and Rashid Amjad call a *popular feeling* that inequality had increased. They argue that

> a major factor responsible for this feeling was the considerable increase in the level of conspicuous consumption and wasteful expenditure on extravagant and lavish housing and other consumer durables by the richer classes in the country. Also, even if the actual level of income distribution had not worsened, the number of people living in abject poverty was still very significant and the display of conspicuous consumption in the face of this extreme poverty stirred considerable tension and finally led to an outbreak of unrest in the country.[63]

Interestingly though, Table 6.10, which shows income inequality over the period, indicates that inequality actually decreased in the 1960s.

While there are differences of opinion about the extent of inequality as a result of the policies pursued under Ayub, there is no denying the fact that interregional disparity between West and East Pakistan did worsen. Even Gustav Papanek accepted the presence of high inequality between the two provinces, although he was able to justify this through an argument that endorsed the social use of inequality (see Box 6.4). Economists, especially in East Pakistan, were great critics of this policy and argued that all the growth or development that had taken place was in West Pakistan and that there had been a transfer of resources from East to West (Tables 6.11 and 6.12 give some indication of this phenomenon).[64] Stephen Lewis shows that the level of per capita income in West Pakistan was only 10 per cent higher than in East Pakistan in 1949/50. This disparity had risen to over 30 per cent in 1964/5. The 'East Pakistanis complained that not only were they less well off at the time of Partition, but they also had been exploited by the West wing to provide resources for development in that richer province.'[65] (Further discussion of regional inequality takes place in Chapter 18.)

Table 6.10
Income Distribution in Pakistan: 1963/4 and 1969/70

% of households	% of income	
	1963/4	1969/70
0–10	2.3	3.2
10–20	4.1	4.8
20–30	5.0	5.6
30–40	6.1	6.6
Lowest 40%	17.5	20.2
40–50	7.1	7.4
50–60	8.4	8.6
60–70	9.8	10.0
70–80	11.9	11.8
Middle 40%	37.2	38.0
80–90	15.1	14.7
90–100	30.2	27.1
Highest 20%	45.3	41.8
Gini coefficient		
National	0.386	0.336
Rural	0.362	0.304
Urban	0.433	0.367

Note: Income shares according to each decile of household have been estimated by fitting a (Lorenz) curve to the cumulative share of various income groups in total households and income derived from the Household Income and Expenditure Survey for the respective years.

6.3 1972–77: The Bhutto Years—Bad Luck or Bad Management?

If there was any economic continuity between the first and second decades, it seems to have all but evaporated between the Ayub and Yahya regimes and that of Zulfikar Ali Bhutto. In many ways, there was a clear break from the past, as more than half of what was Pakistan from 1947 to 1971, had seceded to become an independent country, Bangladesh. Bhutto inherited a new Pakistan, defeated in war by India, and he came to power as Pakistan's first democratically elected leader. These differences from the past were sharp enough, but not only was the political set-up different, Bhutto's economic policies also made a sharp break from the pro-private sector strategies of the earlier years. Bhutto's regime has come in for a lot of criticism for 'destroying' the economy. Critics have argued that his strange concept of socialism was responsible for the dismal growth rates and for the highest rates of inflation ever seen in Pakistan. They have argued that it was poor policies and bad economics which caused the malaise. We examine these claims and also see how factors not in the control of the government affected economic performance. Our interpretation suggests that numerous 'bad luck' factors played a critical role in causing the economy to grow at below trend rates.

There is no doubt that the growth rates of the 1950s and 1960s were particularly impressive. It is also unlikely that those growth rates could have been sustained unless other institutional factors were also changed. Thus, it was inevitable, and more so after the independence of East Pakistan, that the rate of growth would decline. The performance of the Bhutto regime must be seen in the context of the circumstances in which it took over power and the problems that it inherited.

Table 6.13 shows the annual growth rates for GDP and its constituents for 1971/2 to 1976/7. A comparison with the 1950s shows that the growth rates for GDP overall were higher in this period than in the 1950s, although in manufacturing the 1950s had higher rates, while in agriculture the two periods were somewhat similar. For services, given the more developed economy in the 1970s, the growth rate was higher then, despite the fact that industry and agriculture, which form a close link with services, were not growing at the rates of the 1960s. Services grew by 5.7 per cent even when in 1974/5 growth rates in agriculture and manufacturing were both negative. In fact, in each of the three years from 1972 to 1975, the annual growth rate in all services considered together was actually above 10 per cent.

Table 6.14 shows the rates of inflation over the Bhutto period. By any standard, inflation was high in most years of the Bhutto government, especially compared with the very low 3.83 per cent average for the 1960s (however, see section 6.3.2 for an explanation).

Before we turn to an evaluation of the Bhutto government's policies, a word about the data is of particular interest. The Ayub Khan government fell in 1968 and Bhutto took over from General Yahya Khan in December 1971. However, some studies, when examining the performance of the Bhutto period, lump the post-Ayub three years with the Bhutto period, distorting the facts. One example is Nawab Haider Naqvi and Khwaja Sarmad's study, which in its evaluation of Pakistan's economy in the 1970, considers 1969/70 to 1976/7 as one homogenous period and produces average growth rates for the whole of it.[66] The Bhutto period was a distinct period, so clubbing it with the Yahya period does not reveal the true nature of the Bhutto regime. The Pakistan Economic Survey of 1984/5 makes the same mistake and provides average growth rates for the period 1970–7, calling it the 'Non Plan' period.[67] While there may have been no implementation of the Five-Year Plans produced between 1970 and 1977, to evaluate the performance of the Bhutto regime the correct time-frame needs to be kept in mind.

Figure 6.1
Bhutto's Nationalization Programme: 1972–77

20 December 1971	Zulfikar Ali Bhutto takes over as President of Pakistan.
January 1972	Public takeover of 31 large firms in 10 basic industries: iron and steel, basic metals, heavy engineering, motor-vehicle assembly and manufacture, tractor assembly and manufacture, heavy and basic chemicals, petrochemicals, cement and public utilities
March 1972	Land reforms
March 1972	Management and control of 32 life insurance companies
May 1972	Banking reforms; State Bank of Pakistan extends controls over scheduled banks, reorientating credit policy towards small farmers and small industrial entrepreneurs
May 1972	Devaluation of the rupee by 131 per cent
June 1972	Comprehensive labour reforms
August 1972	Comprehensive public health programme
September 1972–September 1974	Nationalization of educational institutions
June 1973	Trade in cotton and rice nationalized
September 1973	Vegetable oil, petroleum marketing, and shipping nationalized
January 1974	Nationalization of all private and domestically owned banks
August 1976	Cotton ginning, rice husking, and flour milling nationalized

6.3.1 Economic Policies and Performance

In its election manifesto, the Pakistan People's Party had promised the nationalization of all basic industries and financial institutions. The manifesto had said that 'those means of production that are the generators of industrial advance or on which depend other industries must not be allowed to be vested in private hands; secondly, that all enterprises that constitute the infrastructure of the national economy must be in public ownership; thirdly, that institutions dealing with the medium of exchange, that is banking and insurance, must be nationalized'.[68] The economic policies of the Bhutto government rested on the premise that the control of the leading enterprises was to be in the hands of the state. Figure 6.1 highlights the salient features of the nationalization agenda of the Bhutto government.

The first phase of nationalization took place in the large-scale manufacturing sector, essentially in the capital and intermediate goods industry. This produced a small share of the total value added of the sector (less than 20 per cent) since much of the growth in this sector had taken place in the consumer goods industries. The nationalization programme was later extended to the vegetable oil sector and then to cotton ginning and rice milling. The nationalization of banks and insurance companies was a critical assault on the close link that had built up between industrial and financial capital since the mid-1950s. This link had been one of the causes of the economic concentration that became a political issue in the late 1960s. The Party's promises to urban organized labour, as to rural peasants and agricultural workers, were fulfilled within six months of coming to power through the labour reforms and land reforms of 1972. The devaluation of the Pakistani rupee by 131 per cent had important repercussions as we show below, and 'removed at one stroke the subsidy the industrialists had received in the earlier period because of the overvalued exchange rate. This reform, together with the increase in procurement prices of agricultural goods (which went up by about 100 per cent in this period), made a deliberate attempt to alter the pro-industry anti-agriculture bias of the previous growth strategy.'[69] The Export Bonus Scheme, a key feature of the 1960s, was also abandoned.

The impact of the government's policies must be seen in the context of what the government had inherited. The loss of East Pakistan, if for no other reason, was important because 50 per cent of West Pakistan's products found their way into East Pakistan in 1969/70, and the loss of such a large

market was cause for concern enough. Furthermore, 18 per cent of the West's imports came from East Pakistan. Hence, new markets had to be found immediately to compensate for this loss of market. The success of the devaluation measure was apparent soon after, when new markets were found and

> the value of export to areas other than the former East Pakistan rose by 41 per cent in the financial year 1972 and 39 per cent in the financial year 1973. This reflected both a sharp jump (about one-third) in the size of the cotton crop in the exports of cotton and cotton textiles, and the successful diversion of most of the flow of cotton, textiles, rice, and other goods with which West Pakistan had previously reimbursed East Pakistan for its flow of jute and jute earnings to West Pakistan.[70]

Exports in 1972/3 increased by 153 per cent over the previous year,[71] and manufactured exports grew by 19 per cent in 1973/4, which, according to the Asian Development Bank, 'was due to favourable world demand conditions for cotton textiles, and the capacity available for production for exports following the loss of the East Wing market in 1971'.[72] The growth in exports was a key factor in the growth in industrial output between 1972 and 1974 (see Table 6.15). Agricultural output also rose, and this was attributed to 'the higher support prices for wheat, rice, sugar, and timely and adequate supply of essential inputs'.[73] Availability of credit also played a vital role in the improved performance, for after May 1972 when the government had tightened its control over the banking system, more credit was available to the export sector and to small farmers. The export refinance scheme was started by the State Bank of Pakistan in 1973, and its lending rate was lower than the nominal banking rate or the kerb market rate.

The economic boom of 1972/3 and 1973/4 seemed to be fairly short-lived and was attributed to the rebound of domestic demand following the disruption in the economy in the early 1970s and to the worldwide commodity boom. However, the world recession after 1974 considerably slowed the demand for Pakistani exports. After about two and a half years of impressive growth, the last three years of the Bhutto government saw the trend substantially reversed with dismal growth rates. Viqar Ahmed and Rashid Amjad argue that those last three years of the Bhutto regime also 'coincide with the 'big-push' in public sector investments in long gestation projects and show a dismal performance in both the agricultural and manufacturing sector'.[74]

One outcome of the nationalization measures was the complete reversal of public and private investment. The substantial contribution by the private sector in the 1960s was cut down at a stroke. In 1974/5, the height of the Bhutto regime's nationalization programme, private sector investment was only 15 per cent of its 1969/70 level (see Table 6.16). Public sector investment, which was 5 per cent of the total in 1970/1, rose to 75 per cent at the end of the Bhutto era. These figures may suggest that the Bhutto regime's nationalization programme alone was responsible for this trend, but it is important to realize that 'private investment had already started to climb down even before nationalization struck it down in 1972',[75] and that the decline in investment during the second half of the 1960s, which indicates that growth in large-scale manufacturing had slowed, was a trend which continued into the 1970s. However, there is no doubt that the anti-industrialist policies and great uncertainty of the 1972–7 period were also responsible for the lack of private sector investment. The private sector had lost all trust in the government, for Bhutto had broken his promises: 'his assurance of no further nationalization [prior to nationalizing the vegetable oil industry in September 1973] until the elections of 1977 no longer seemed meaningful and the little confidence that the businessmen had developed in the regime was now completely gone'.[76] Such promises were broken time and time again.

6.3.2 The Bad Luck Factor

The fact that the economy suffered after 1974 is clear. The reasons, for this, however, are open to some debate. Figure 6.2 shows that a number of events that took place outside the control of the government were largely responsible for the poor performance of the economy after 1974. There was a very large increase in the prices of imports following the oil price rise in 1973, which resulted in inflation at close to

Figure 6.2
Bhutto: The Bad Luck Factor?

20 December 1971	Zulfikar Ali Bhutto takes over as President of Pakistan.
May 1972	Devaluation of the Pakistani rupee; initial outcome highly positive with exports growing by more than 100 per cent
August 1973	Massive floods hit Pakistan; import of food grain.
October 1973	Four-fold increase in international petroleum prices; imports cost much more; prices of fertilizers, essential inputs and oil jump; excessive inflation domestically
1974–77	World recession follows OPEC price rise; demand for Pakistani exports remains severely depressed and affects industrial output.
1974–75	Huge failure of cotton crop by as much as 25 per cent at a time when international cotton prices had risen; affected industrial output
1976–77	Worst floods in Pakistan's history; agricultural crops destroyed; further import of food crops; excessive expenditure on public good measures, all affecting industrial output

30 per cent in 1973/4. The oil price rise had begun to affect the gains from devaluation and exports, and in one go wiped out the positive balance of trade from 1972/3. While export growth still showed some positive signs, albeit at a much slower pace, the import bill grew very significantly (see Table 6.15). In one year alone, oil imports rose from US$60 million in 1972/3 to $225 million in 1973/4; fertilizers increased from $40 million to $150 million in the same period.[77] The result of the huge rise in oil prices was an international recession that was not in the control of the Bhutto government.

Moreover, in the five years of the Bhutto government, floods and pest attacks damaged crops severely, putting pressure on prices and affecting industrial production.[78] The failure of the cotton crop in 1974/5 came at a time when there was a surge in international prices and hence Pakistan was not able to exploit the situation to its advantage. The year 1976/7 saw Pakistan's worst floods, devastating large areas of cultivated land.

Excessive inflation was seen as Bhutto's biggest failure, but a closer look at the management of the economy and of the growth in monetary assets suggests that much of the inflation was imported. Table 6.17 shows that excessive monetary growth took place only in the first and last of his five and a half years. The increase in 1971/2 was primarily due to the adjustments necessitated by the loss of East Pakistan and to the increase in exports. Viqar Ahmed and Rashid Amjad write that the economy had been well managed in the early years without excessive deficit financing despite the costs incurred due to the floods, and monetary expansion had been kept well in line with GNP growth, and was 'almost entirely limited to the private sector. There had in fact been an overall contractionary effect in the government and foreign sector'.[79] A very negative perception seems to have become part of the literature on the Bhutto period, where, despite the facts, a number of observers believe that the economy under Bhutto was in a shambles. William McCleary, for example, argues that there was 'generally poor performance and relative stagnation in the 1970s', and that a 'lack of fiscal and monetary discipline led to high budget deficits, rapid monetary growth, and inflation'.[80]

Mohsin S. Khan of the IMF, however, has also made an important intervention in the debate over Bhutto's economy, and particularly about the rate of inflation. He writes that 'a good part of the increase in the earlier period [of the Bhutto era] was a result of the oil price shock in 1973/74. If these two years are dropped from the case, the average annual rate of inflation in the 1970s falls to less than 10 per

cent. . . . Certainly, it is not obvious from the numbers that the 1970s were characterized 'by generally poor performance and relative stagnation' or that the 1980s were so much better on all fronts.'[81] Shahid Javed Burki, otherwise a critic of Bhutto's politics, also maintains that 'Pakistan's performance during the seventies appears unsatisfactory only when compared to that of the sixties. The seventies produced a better overall record compared to the fifties. . .'.[82]

The key causes of low growth in the mid-1970s were possibly an extremely adverse weather cycle along with an international recession. Government policy did not help much either, where industrialists were eyed with suspicion, and in response to government fears and threats the industrialists created artificial crises. While organized labour felt that it had a greater right to the share of industrial produce, industrialists feared more lock-outs or outright nationalization. Entrepreneurs were demoralized and unwilling to invest. Capital and capitalists had fled overseas and it was clear that the economy and industry were faced with a severe crisis, no matter what the causes may originally have been. The Bhutto era has been considered one of Pakistan's worst economically. Nawab Haider Naqvi and Khwaja Sarmad have argued that this period was 'a period of domestic and international economic turmoil, significant external shocks and economic dislocation and disruption'.[83] We have tried to show that (1) things were not as bad as they seemed, given the conditions inherited and the odds against Bhutto, and (2) it was more bad luck than bad management which resulted in poor economic growth rates. The implications and consequences of the Bhutto regime for the social and political evolution of Pakistan are addressed in Part VI of this book.

6.4 Summary and Further Reading

6.4.1 Summary

This is an important chapter because it examines the history of the industrialization process over the first three decades of Pakistan's existence, and examines specific policies pursued by different regimes to further the goals of industrialization. In the first decade, the exchange rate and the trade regime played an important role in determining the direction of industrial development in Pakistan, laying the ground for later years. Starting from an almost non-existent industrial base, economic growth in the period 1947–58 was impressive. It became even more astonishing in the Decade of Development under Ayub Khan between 1958 and 1968.

Industrial development showed extraordinary growth rates under Ayub, and there was a perception that Pakistan would soon emerge as one of the few underdeveloped countries to join the ranks of the developed world. Moreover, while agriculture suffered severely during the 1950s, in the 1960s the Green Revolution brought about an equally impressive transformation, complementing industrial growth. Overall economic development was quite phenomenal in this period. There was also a downside to this capitalist development, as is always the case. Inequalities between East and West Pakistan

increased, as did those between different economic and social classes. However, despite these inherent contradictions in the mode of capitalist development under the Ayub regime, we argue that the economic programme and policies followed resulted in extremely impressive growth. Rather than being labelled as a failure, the Ayub regime was dynamic and a 'success' by whatever criteria were available at that time to measure success.

The Bhutto era represents a significant break with the past. With more than half the country now an independent nation, Bhutto assumed leadership of a war-torn Pakistan and inherited extremely difficult conditions. Despite this, the first two years of his five-and-a-half year rule showed exemplary growth by any standard. In the subsequent years, however, a large number of factors over which Bhutto had no control resulted in a slowing down of the growth rate and of economic development, especially after the high-growth 1960s. We argue that it was not bad management that caused economic deterioration in the Bhutto period, but bad luck.

This chapter makes an important contribution to the debate over economic growth and development during the first three decades, by contesting and arguing against some of the more popular myths that have emerged about this period in the literature.

Firstly, we argue that the import substituting industrialization policy pursued in the first decade was the right policy *for that time*, and that a careful and selective manipulation of key economic variables resulted in an industrial base being formed. Secondly, we argue that Ayub Khan's Decade of Development was indeed that—not a failure of development, as some observers contend—and that the contradictions that emerged were all inherent in the policies pursued. This was, probably, Pakistan's Golden Age. And lastly, we show that the Bhutto government suffered the consequences of bad luck, both domestic and international. Not only was Bhutto not wholly responsible for the poor performance, but the extent of that poor performance has, itself, been grossly exaggerated. Economic performance was not half as bad as we have generally been led to believe.

6.4.2 Further Reading

Some of the best academic work on Pakistan looks at the period 1960–70 and the growth model adopted in this period. Since industry was a major component of growth, many of the best works on Pakistan examine industrial performance in the earlier years. The two books by Stephen R. Lewis, Jr, *Economic Policy and Industrial Growth in Pakistan* (London: George Allen and Unwin, 1969) and *Pakistan: Industrialization and Trade Policies* (London: George Allen and Unwin, 1970) are classics which examine in great detail the early period following Pakistan's independence. Gustav Papanek's *Pakistan's Development: Social Goals and Private Incentives* (Cambridge, MA: Harvard University Press, 1967) also covers the early period, and is a first-hand account by someone who was involved in public policy. Other books on this period include White, L. J., *Industrial Concentration and Economic Power in Pakistan*(Princeton, NJ: PUP, 1974); MacEwan, Arthur, *Development Alternatives in Pakistan* (Cambridge, MA: Harvard University Press, 1971); and Madison, A., *Social Development in Pakistan, 1947–1970* (Cambridge, MA: Harvard University Press, 1971).

On the industrial policy of the Ayub Khan era, good references are Rashid Amjad's *Private Industrial Investment in Pakistan, 1960–1970* (Cambridge: University Press, 1982) and two PhD dissertations, one by Meekal Ahmed, 'Productivity, Prices and Relative Income Shares in Pakistan's Large Scale Manufacturing Sector, 1958–70', University of Oxford, 1980, and A. R. Kemal, 'An Analysis of Industrial Efficiency in Pakistan, 1959–60 to 1969–70', University of Manchester, 1978.

For the Bhutto period, see Shahid Javed Burki's *State and Society in Pakistan, 1971–77* (London: Macmillan, 1980); Adams, J. and Sabiha Iqbal, *Exports, Politics and Economic Development in Pakistan* (Lahore: Vanguard, 1987); and two doctoral dissertations, Maleeha Lodhi's, 'Bhutto, the Pakistan People's Party and Political Development in Pakistan', London School of Economics and Political Science, 1980, and Zareen F. Naqvi's 'Distributional Impact of Public Enterprise Operational Policies in Pakistan', Boston University, 1994.

Some texts worth studying in greater detail which look at all three of the periods covered in this chapter are: Viqar Ahmed and Rashid Amjad's *The Management of Pakistan's Economy, 1947–82* (Karachi: Oxford University Press, 1984); Asad Sayeed's excellent 'Political Alignments, the State and Industrial Policy in Pakistan: A Comparison of Performance in the 1960s and 1980s', PhD dissertation, University of Cambridge, 1995; and Parvez Hasan's *Pakistan's Economy at the Crossroads: Past Policies and Present Imperatives* (Karachi: Oxford University Press, 1998).

7 The Process of Industrialization in Pakistan II: 1977–2013

After the fall of Zulfikar Ali Bhutto in July 1977, Pakistan can easily be delineated by two specific eras or periods. From 1977 to August 1988 General Zia ul-Haq ruled Pakistan, the longest rule ever by a single individual in Pakistan's sixty-six years of existence. Zia's military dictatorship varied from downright ruthlessness to a more benign form of praetorian democracy after 1985. Nevertheless, General Zia's authoritarian and dictatorial rule will always be remembered for the great damage it did to Pakistan's society and its values. In many ways, sadly, it has been Zia's politics and policies which have defined Pakistan for the last three decades, although there is hope that this is changing. Despite attempts to introduce participation, starting from the local bodies elections of 1979, General Zia never let go of the reins of power, a fact ably demonstrated in May 1988 when the elected government of Mohammad Khan Junejo was summarily dismissed. Zia ul-Haq was killed in an air crash in August 1988 and we can only speculate about the nature of developments in Pakistan had Zia not met his death in this fashion. Nevertheless, with the death of Zia, we saw much of his legacy still had a strong bearing on political and economic developments in Pakistan some decades on.

During the Zia era, Pakistan witnessed the return of high growth rates and an increased role for the private sector, in many ways reminiscent of the Decade of Development of the Ayub regime. But much had changed, in the form of class structures, social and political alliances, and the nature of the development of society, and the comparison between the Ayub and Zia periods makes very interesting reading.[1] This chapter will examine the policies of the Zia government with special emphasis on the process of industrialization. A comparison between the Ayub and Zia regimes and an analysis of social and economic outcomes under Zia are given in Chapter 26 and Chapter 27, as are the consequences brought about by the nine years of Pakistan's third military ruler, General Pervez Musharraf. However, Appendix 7.1 provides a flavour of the extent and result of differences between the two regimes, regarding the type of entrepreneurs that emerged.

Just as much as the 1977–88 period is distinct in its form and manner, the post-Zia period opens up a very different age in Pakistan's history, both politically and economically. There had been a return to democracy—or electioneering, more correctly—between 1988–99, with elections being held in Pakistan in 1988 after a lapse of eleven years, with three general elections held subsequently. Pakistan saw ten governments between 28 May 1988 and February 1997, and despite this high turnover, the military, which has always been prone to interfere in national politics in Pakistan, let the political process take its course until 1999 although it continued to manipulate, control, and dominate elected governments until General Pervez Musharraf overthrew the democratically elected government of Nawaz Sharif in October 1999 and took over power.[2] Interestingly, despite the frequent changes in government, the economic programme of different governments in Pakistan has been more or less the same, and one finds a great deal of continuity in policy, especially since September 1988.

Much of what has happened in the economic sector in Pakistan since 1988 has its genesis as part of a series of comprehensive Structural Adjustment Programmes undertaken under the close supervision of the International Monetary Fund (IMF) and the World Bank. Although Pakistan's adherence to IMF and World Bank policies began in earnest in 1980 when a large Extended Fund Facility programme was supported by the IMF, followed by many structural adjustment and sectoral loans from the World Bank, it would be fair to say that since 1988 Pakistan's economic programme has totally capitulated to the requirements of the IMF and the World Bank. Since then, Pakistan's numerous and varied governments have failed to come up with any independent economic or industrial development programme, and the very minutely detailed Policy Framework Papers of the IMF and World Bank have determined the nature and direction of policy. The most recent People's Party government of 2008–13 also undertook a $11.3 billion IMF programme soon after it came into office, as did the Nawaz Sharif government after May 2013, having been granted an IMF loan in September 2013. Going to the IMF is now the default mode for every government in Pakistan regardless of any adherence to perceived political ideology. Given the complete dominance of these two Washington organizations on the economic life of the country, the whole of Part VI of this book deals with the consequences for Pakistan of adhering to these structural adjustment policies. In this chapter, we try to limit ourselves to industrial policy and related issues. However, for a more comprehensive understanding of the industrial policy after 1988, a concurrent reading of Part VI is recommended.

There are two broad sections to this chapter: we examine first the process of industrialization in the Zia period, and second, the post-1988 era of structural adjustment.

7.1 THE ZIA YEARS: 1977–88[3]

7.1.1 The Nature and Extent of Growth

The phenomenal overall performance of the economy during this period can best be gauged from the following observation by Akbar Noman:

> according to *World Development Report 1990*, during 1980–88 Pakistan's GDP growth rate of 6.5 per cent was exceeded only by that of Korea, China and Hong Kong. . . . The growth of real wages in Pakistani manufacturing during 1980–88 was just about the fastest in the world—at 6.2 per cent a year surpassed only by Thailand (7.0%) and equalled only by Singapore.[4]

For the period 1978–86, S. N. H. Naqvi and Khwaja Sarmad show that GDP growth averaged 7 per cent consistency per annum.[5] According to the World Bank, manufacturing GDP grew at an annual average rate of 9.5 per cent between 1977 and 1986, and investment in medium- and large-scale industry grew at an average of 18.2 per cent per annum, while total private industrial investment expanded at 15.6 per cent per annum.[6] This is, indeed, a very impressive performance by any standard, whether in comparison with the performance of the Ayub regime or with the newly industrialized countries in the same period.

Table 7.1 shows the annual growth rate in value of output, labour, and other indicators for a large number of manufacturing industries in the period 1978–88. The total average growth in this period was a very impressive 9.6 per cent, with the first half of the Zia era showing an even higher rate of 12.8 per cent.[7] In both the Fifth and Sixth Five-Year Plans (1978–83 and 1983–8), actual growth rates exceeded the targets of 12 per cent and 9 per cent, respectively,[8] a rare occurrence in Pakistan's economic record. Table 7.2 shows how the high growth rates were disaggregated over the Fifth and Sixth Five-Year Plans.

Although the growth figures are very impressive, Asad Sayeed writes that a significantly different, and much less rosy, picture emerges with productivity growth figures (fourth column in Table 7.1). Not only is the aggregate of 0.3 per cent per annum low compared to the 5 per cent growth in the 1960s, but also the variation across sectors is significant.[9] Furthermore, if we aggregate the total factor productivity (TFP) growth rates, we can see that consumer goods have negative TFP growth, with the exception of the wearing apparel industry. A fairly mixed picture is presented by the intermediate goods industry. Table 7.3 highlights the low contribution of TFP growth to overall growth during the decade. As much as 82.3 per cent of the overall growth was due to the growth in the capital stock, 14.5 per cent to labour, and only 3.17 per cent to TFP growth, compare this

Table 7.1
Growth Rates of Output, Labour, Capital Stock, and Total Factor Productivity: 1978–88

Industry sector	Output	Labour	Capital stock	Total Factor Productivity output	Total Factor Productivity
Food manufacturing	8.8	7.4	7.3	1.5	–1.1
Beverages industries	6.5	9.2	12.8	–5.9	–6.7

to the figures presented in the previous chapter in Table 6.8. Asad Sayeed writes that in the case of Pakistan not only is the contribution of TFP significantly lower than that of the developing country average, but the contribution of capital is also inordinately high.[10]

Table 7.4 shows that there had been very little growth in employment in almost all industries between 1975 and 1986, and that the growth in labour productivity had also fallen in many industries. Interestingly, although the wearing apparel industry experienced the greatest increase in employment, it also saw output fall by nearly 19 per cent. A UNIDO report on the manufacturing sector gives the reasons for this low employment generation and says that

> an underlying feature of industrialization in Pakistan is the deteriorating performance of the manufacturing sector in generating new employment opportunities. Although the decade of the 1980s has been a period of relatively high growth in manufacturing value added, the growth in manufacturing employment has remained insignificant. This partly represents more an increase in capital industry than labour absorption during the period of accelerated expansion.[11]

Pakistan's manufacturing sector became more capital intensive between 1975 and 1986 and the share of wages and salaries in value added fell from 26.9 per cent in 1976 to 20.3 per cent in 1986.[12] A report published by the Institute of Developing Economies in Japan found it 'ironic' that

> some of the public sector dominated industries, such as electrical machinery and chemicals, show a high rate of growth in labour productivity. Firstly, we would expect labour productivity to be higher in capital-intensive projects where the labour–output ratio is high. And secondly, as large firms attain a higher level of capacity utilization, labour productivity will be expected to increase.[13]

Table 7.3
Decomposition of Manufacturing Growth: 1978–88

Industry sector	α	β	Share of labour %	Share of capital %	Share of TFP %
Food manufacturing	0.13	0.87	11.20	71.92	16.88
Beverages industries	0.11	0.89	16.02	176.25	-92.27
Tobacco	0.40	0.96	0.63	115.37	-16.00
Textiles	0. 49	0.51	8.30	55.75	35.96
Wearing apparel	0.24	0.76	24.75	37.73	37.53

7.1.2 Industrial Policy

For Asad Sayeed, the 1978–88 period 'is the only epoch in the country's 48-year history when an industrial policy was formulated and executed for any length of time'.[14] S. N. H. Naqvi and Khwaja Sarmad see the Zia regime consisting of two sub-periods, 1978–81 and 1982–6,[15] while for the Institute of Developing Economies, Tokyo, there were three such periods: 1977–81, which was the period of 'cautious attempts at dismantling existing government policies and restoring confidence in the private sector, while simultaneously trying to gain political legitimacy'; 1982–5, 'a more forceful drive towards Islamization which followed the regime's consolidation of power'; and 1985–8, the 'attempt to disengage the government from direct control of the economy'.[16]

One of the most important concerns of the new Zia regime in mid-1977 was the need to restore business confidence and, particularly, private sector confidence and motivation, in order to revive investment in industry and agriculture, in order to improve the economy's performance substantially compared to the less than impressive performance during the Bhutto period. The military government of General Zia ul-Haq, like the military government of Field Marshal Ayub Khan, made the decision that the private sector was to play the leading role in the industrial sector.

Amongst the earliest steps taken by the Zia government in September 1977, to appease the private sector, was the denationalization of a number of agro-based industries—rice husking, flour milling, and cotton ginning—which were run inefficiently and were heavily 'in the red', along with the denationalization of some small engineering units as well.[17] In December 1977, a number of basic and heavy chemical and cement industries were opened up to the private sector, which was also given further incentives, such as tax holidays in March 1978, which were essentially aimed at encouraging industrial activity in the less developed regions of the country. Export rebates were also given priority, and in June 1978 the interest rate on fixed investment in agriculture and industry was also reduced. Some attempts were also made by the new military government to ease economic controls and regulations, including the procedures for the sanctioning of private sector investment.[18]

If the prominence given to the private sector brought back memories of the Ayub Khan era, so did the return to planning

Table 7.4
Growth and Structure of Manufacturing Employment: 1975–86

Industry sector	Growth of employment in manufacturing	Structure of manufacturing employment		Labour growth of Value-added per employee (% at 1980 prices)

in the guise of the Five-Year Plans. As an Asian Development Report stated: 'with a change in government in 1977 came a change in industrial strategy. The new government reinstated the system of five-year plans, and the Fifth Five-Year Plan was launched in 1978/79.'[19] In fact, there had not been much planning after the very successful second Five-Year Plan of 1960–5, when the third was curtailed and handicapped by the cut in foreign aid and the political situation domestically. The Third Five-Year Plan was made redundant after East Pakistan became independent Bangladesh, and the Fourth Five-Year Plan was lost somewhere in Zulfikar Ali Bhutto's rule of five years, a period better known as the Non-Plan Period.

The investment programme of the Fifth Five-Year Plan gave very high priority

> to producer and investment goods industries with industry based on indigenous raw materials next in line. Apart from bringing back the private sector, the stress on the use of indigenous raw materials in industry was also seen as important to revive the sluggish performance of the agricultural sector. . . . The economic managers of the Zia regime were looking for short and medium term gains to accrue from a boost in textile exports.[20]

Growth in large-scale manufacturing was projected at the highly ambitious rate of 12 per cent per annum, a target which was, surprisingly, achieved.

The policy measure that distinguishes the Zia regime from all others before and after General Zia was that of Islamization. In fact, it became General Zia's government's and his own mission to purify Pakistani society from all the ills and evils that had become ingrained. Islamic laws were enacted and Commissions formed, and even the economy was brought under the influence of Islamic laws and principles. Writing in 1984, Viqar Ahmed and Rashid Amjad argue:

> The major hallmark of the current phase is the initiation of the process of Islamization of the country's economic structure. The cautious steps taken so far are few and the overall framework is yet to acquire an Islamic look. But this is a task of historic magnitude. Starting with a lag of many centuries during which little effort could be made to apply Islamic principles to the changing socio-economic conditions and institutional structure in Muslim countries, considerable homework needs to be done and this underlines the need for a slow but firm start. But, given the people's commitment to Islam and the Islamic principles of faith in God, social justice and fair play, the process which has been started is not likely to be reversed.[21]

They continue:

> Currently most of the government's effort in long-term management is concentrated on the process of Islamization which, in terms of the long-run impact on the economy, may surpass the restructuring of the development strategy and the Plan priorities. The process involves a basic transformation of the entire society and intra-social relationships in conformity with the tenets of Islam. Social justice in every walk of life by following the Islamic principles, especially in the distribution of income and wealth in favour of the poor, and the elimination of interest (*sood*) charged by banks are viewed as key features of the Islamization process.[22]

Although much was made of the Islamization programme of the Zia regime at that time, most critics of the regime felt that it was a ploy on the part of the military government in order to legitimize and perpetuate its hold on power. Anita Weiss argues that 'attempts by the state to develop an Islamic economic system are not substantive departures from capitalist industrial culture, but are instead substitutes for specific aspects of it'.[23] Islam became the veil behind which Zia and his coterie hid and perpetuated their authoritarian form of government. Although all the Islamic laws passed by that government still form part of the law of the land, the fanfare has died down and governments since Zia's have not (as yet) used Islam for propaganda purposes. Interestingly, while Viqar Ahmed and Rashid Amjad, writing at the height of the Islamization campaign and at the time of a strict military authoritarianism, like most other authors, gave the Islamization process extensive prominence, much of what has been written on the Zia period's economic programme after the death of the General does not give much importance to what was considered to be his key programme. While Islamic codes and regulations do prevail, they seem to exist mainly on paper (see Chapter 12 on banking).

7.1.3 The Public/Private Sector Divide

One would have thought that with the Zia government's penchant for the private sector the first step would have been large-scale denationalization and the return of assets seized and nationalized under the Bhutto regime. At the time when Bhutto was deposed, the public sector dominated industrial development and the private sector had been reduced to a much smaller role than under Ayub Khan. An immediate reversal was anticipated, but other than the small and insignificant measures mentioned above, very little denationalization took place. The major contribution by the Zia government in the early years was to give a 'clear signal to the private sector that the government expected future growth to come from its increased participation in industrial activity'.[24]

An Asian Development Bank report defends this action by the Zia regime on the following grounds:

> The military government made the decision that the private sector was to play the leading role in the industrial sector. However, the existing public industrial sector was quite large, employing over 50,000 persons, and a massive investment programme of over Rs. 40 billion was underway. Thus it was not practical for the Government to undertake any large-scale denationalization. Original owners were only prepared to take the units back if the losses accumulated since nationalization in 1972 were written off and the surplus workers fired. The Government could not do that because of political and administrative reasons. Neither was it possible to abandon the industrial sector investment programme because a large proportion of the funds had been either spent or committed in the form of international contracts. The Government therefore decided on a more gradual process of reorientation toward private sector-led industrial growth. To restore the confidence of the private sector, the agricultural processing industries taken over in 1976 were denationalized, and a number of industrial incentives similar to those existing during the 1960s were introduced. As for public sector industries, a programme for improving efficiency and profitability was initiated, and the investment programme was restricted to ongoing projects and to the balancing, modernization, and replacement (BMR) of existing public sector units.[25]

However, the study by the Institute of Developing Economies in Japan makes the rather more pertinent point that 'in contrast to its [the Zia regime's] rhetoric against the Bhutto government's economic agenda, the Zia government was hoping to reap the rewards from investments made by the previous regime'.[26] This study continues that, even at the time of the Sixth Five-Year Plan, there were no clear moves towards privatization: 'In fact, public sector industry was seen as playing an instrumental role in industrialization in particular and development in general'.[27] Moreover, the study goes on to make the very astute point that

> the political economy of the government's decision not to go on a large scale privatization drive was that it did not want to alienate those groups and classes which had benefitted from nationalization by seeking employment in the sector. This group also comprised the urban

> lower middle class, which had been the most potent political agitator in Pakistan's history.[28]

While there was no immediate reversal, there certainly was a marked slowing down. Table 7.5 shows that the public sector's share in total industrial investment fell from as much as 72 per cent in 1978–9 to less than 18 per cent ten years later. Although there was some increase in employment, this was mainly due to the projects originated earlier. The bulk of public sector investment during the first half of the Zia regime was going into ongoing projects. In the Fifth Five-Year Plan (1978–83) only 23 per cent of total public industrial outlay was on new projects.[29] In the early years of the Zia government, public sector output increased much more rapidly than private sector large-scale manufacturing output, but in the second half of the ten years, the growth of the private sector was faster.[30] The impetus of growth in the first three years of the Fifth Plan was the public sector, as many of the projects started earlier, especially in the fertilizer and cement sectors, came online.

Essentially then, while the Zia government was very favourably inclined towards the private sector and blamed much of the ills of the economy on Bhutto's economic policies, including nationalization, the Zia regime took a far more pragmatic and politically clever line by not denationalizing in haste. It encouraged the private sector by giving it greater incentives and removing controls, and by opening up sectors and areas previously exclusive to the public sector. Once the government realized that ownership and control of the public sector industries was an effective tool for granting political patronage and favour, there seemed little recourse to gift such a means away. The best example of this is the fact that the all powerful and important financial sector was retained by the government, and no denationalization or privatization of banks took place when General Zia was in power.

Table 7.5
Share of Public Industrial Enterprise in Total Large-Scale Manufacturing: 1978–88

Years	Employment share (%)	Value added (%)	Public sector share in total industrial investment (%)
1978/9	14.47	7.12	72.74
1979/80	14.34	14.55	65.25
1980/1	15.24	12.27	58.01
1981/2	16.15	13.28	52.03
1982/3	14.82	13.90	48.29
1983/4	16.36	11.81	44.56
1984/5	–	–	31.38
1985/6	–	–	30.68
1986/7	–	–	21.64
1987/8			17.85

7.1.4 Deregulation and Liberalization

The Sixth Five-Year Plan (1983–8) marks the beginning of the process of deregulation and liberalization, which was carried out with much greater force after 1988 when Pakistan's economy became completely subservient to IMF and World Bank directives. The Sixth Five-Year Plan is seen as a departure from the government's earlier policies on industry, and 'it was for the first time that the emphasis moved from purely one of sectoral investment planning to one which also incorporated incentives and institutional reforms to enhance the efficiency of the industrial sector'.[31] Export-led industrialization was mentioned for the first time as a policy goal, and there was an emphasis on the broadening of manufactured exports towards higher value-added items.

Amongst the more important initiatives in pursuit of deregulation and liberalization in this period were the following:

> An increase in the investment sanction limit; drastic reduction in the list of specified industries (which require government sanction); reduction of tariffs on a number of raw materials, intermediate and capital goods; introduction of a three-year liberal trade policy; and upgrading of an Industrial Incentives Reform Cell (IIRC) into a Tariff Commission in 1989 to make recommendations on fiscal anomalies and effective protection.
>
> A series of measures . . . introduced to deregulate industrial operations in the cement, oil-seeds and fertilizer industries. Private investment . . . permitted in cement production and State-owned enterprises . . . allowed to vary their prices. Subsidies . . . substantially reduced and cement imports permitted. A similar package of de-regulation and reform was adopted for the oil-seeds sector and a major divesture programme was initiated by the public ghee corporation.[32]

Along with these measures, important steps were taken to liberalize and encourage foreign trade. Prior to 1983, imports were considered to be either 'free' or 'tied', and goods that were on neither of the two lists, were banned. In 1983 this system was changed and a negative list was introduced, where everything not on that list was now importable. There was also a replacement of quantitative restrictions (non-tariff barriers) by tariffs, which according to the Asian Development Bank was a 'significant development since in Pakistan quantitative restrictions have been a more important source of protection than tariffs'.[33] To encourage exports, manufactured exports were given rebates, and exporters were given import facilities, income tax concessions, and finance at concessionary rates.

All the major works on the Zia period—Asad Sayeed, the Asian Development Bank, the Institute for Developing Economies and S. N. H. Naqvi and Khwaja Sarmad—are agreed:

> Perhaps the most important and far reaching economic decision taken by the government was

to remove the fixed peg of the Rupee to the Dollar by introducing a managed float of the currency in 1982. As a result between 1982 and 1987–88 the Rupee was devalued by 38.5%, with an average devaluation of 7.7% per annum. While there were other macro considerations which dictated the decision to move away from the peg, its impact on industrial decisions to invest and produce was central. The biggest impact was expected to come in export performance. Conventional wisdom has it that Pakistan's export performance has been sluggish because of an overvalued exchange rate. The overvalued exchange rate, it is argued, discriminates against exports not only in capturing larger world market shares but [also in] the implicit protection it accords to manufactured goods at home which inhibits the direction of resources into export industries. Correcting for the exchange rate was seen as the [most] important step in devising an incentive structure geared towards exports.

> Devaluation was also expected to perform an important import substitutive function. Devaluation will enhance prices of imported capital and intermediate goods and will thus induce backward linkages for producer goods industries. Thus the decision was also consistent with the industrial policy priorities of the government as outlined above.[34]

The World Bank, not surprisingly, was particularly happy with the results of the deregulation and liberalization policies of the Sixth Plan. It calculated that the 'private sector's share in total fixed investment increased from 38 per cent in FY83 [1982/3] to 42 per cent in FY88 [1987/8] and in the manufacturing sector its share in investment rose from 51 per cent to 83 per cent'.[35] In a report published earlier, in 1988, the World Bank argues as follows:

> Industrial growth has been encouraged by an improvement in the industrial policy environment for private sector initiative, in accord with Sixth Plan objectives. The composition of industrial investment has shifted heavily toward the private sector. Private industrial investment expanded by almost 23% p.a. in real terms during the Plan period, as against a 7% annual increase in total industrial investment. In total, over 72% of total industrial investment during FY84–87 was contributed by the private sector. The restriction that public manufacturing investment be limited to the completion of ongoing projects and to rehabilitation of existing plants contributed to this outcome.[36]

7.1.5 Causes of High Growth and the Success of the Zia Regime

The fact that General Zia ruled Pakistan for more than eleven years surprised almost all observers. In July 1977, when he took over from Bhutto, Zia came across as an inexperienced, bumbling General who, it seemed, either would not be able to hold on to power, or would willingly transfer power to politicians as he kept promising. No one at that time could have envisaged the fact that General Zia would emerge as Pakistan's longest ruler. Moreover, the only way power was transferred away from Zia to another head of state was through his death in an air crash. The political reasons why he managed to outlast and outwit the opposition have been documented by, amongst others, Omar Noman, Jonathan Addleton and Asad Sayeed[37] (see also Chapter 22 of this book). This chapter only highlights the reasons why the economy performed as well as it did and how a booming economy helped neutralize all political opposition against the government. While there were many political and human rights grounds for the protests against Zia which continued all through his rule, there were few economic justifications for opposition.

Again, all the major authors cited in this chapter are agreed about the causes of a high-growth economy under Zia. The Institute of Developing Economies study summarizes these issues as follows:

> On the whole the manufacturing sector in Pakistan has recorded impressive growth rates during the 1977–88 period. As we have attempted to show the principle reason for this performance has been a result of two important phenomena:
>
> i) the coming on stream of the public sector provided the requisite diversity in the manufacturing sector. This resulted in both the once and for all gains that such large investments are expected to bring in and secondly in the linkage effects that it created.
> ii) the revival of confidence in the private sector to invest in industry once again after the brief interlude of the Bhutto regime. The spheres for private industrial investment that were charted out by the Bhutto regime, i.e. the consumer goods sector and the picking up of linkage effects that the public sector would create, reached fruition in the period under review.
>
> The underlying reason for high rates of growth and investment for growth in output was buoyant demand in the economy as a whole. Because of the remittances from the Gulf and a growing agricultural and services sector consumption demand increased. Investment demand, on the other hand, was enhanced by high resource inflows from the international community, particularly the US, because of Pakistan's strategic role in the Afghan war.[38]

Nawab Haider Naqvi and Khwaja Sarmad believe that the high growth rate of GDP which averaged 7 per cent per annum between 1978 and 1986 was due to a strong expansion in manufacturing led by a booming domestic market (due to remittances and the income from illegal trade, which increased significantly following the Afghan crisis) and the utilization of excess capacity'.[39] Workers' remittances had peaked at $3 billion in 1982/3, and a steady

flow of official capital such as long-term loans and grants, amounting to an 'annual average of more than one billion US dollars enabled the government to finance its way out of the difficult situation created by the deteriorating terms of trade',[40] and helped maintain macroeconomic stability as well as promoting a high growth rate of GDP. During the Fifth Five-Year Plan (1978–83), according to Robert Laporte and Muzaffar Ahmad, the '*yearly average* of foreign aid committed to Pakistan was $1.45 billion, up from the yearly average of $871 million during the Non-Plan period 1970–78'.[41] This annual average of foreign aid committed to Pakistan during the Sixth Five-Year Plan (1983–8), rose to as much as $2.29 billion.[42]

Asad Sayeed shows that while the contribution of foreign resource inflows was an important source of assistance to the Zia regime and helped finance industrial investment, interestingly, its share in total investment declined to almost half its share of 1965–70, and to one-sixth of the heyday of the Ayub period (1960–5) when foreign assistance was a critical factor, resulting in very high rates of growth.[43] Foreign resource inflows are yet another similarity between the Zia and Ayub eras, where external sources helped fund Pakistan's economic development programme. Under Ayub, it was US aid that played the most critical role, while under Zia both US aid, following the invasion of Afghanistan by the Soviet Union, and remittances by Pakistani workers contributed very significantly. In some ways, while the 'bad luck' factor may have contributed to the below-par performance of the Bhutto regime, a 'good luck' element, particularly the Soviet invasion of Afghanistan and high Gulf remittances, helped General Zia's economy considerably, and helped prolong his rule.

However, such a high dependence on external assistance and on extraneous sources meant that when foreign inflows ceased, so would economic development. This was most noticeable under the Ayub regime, but also became a factor in the later period of General Zia's rule. S. N. H. Naqvi and Khwaja Sarmad write:

> The outstanding feature of this period [1978–81] is the rise in remittances, which pushed up the national saving rate. The average share of investment in the GDP rose to 20 per cent in 1977, and was high by historical standards. The growth in investment was due to an increase in public investment in the social and economic infrastructure. The investment in public enterprise remained low, and so did private investment. Public investment increased to an average of 11.6 per cent of the GDP despite the relative decline in external capital to the public sector. This, however, did not alter the public sector's position as the largest recipient of foreign capital. The high level of public investment was financed mainly from household savings (net resource).[44]

While there seems to be agreement that the Zia regime produced high growth, two of the studies cited above have argued that much of what we have seen 'cloaked' the inefficiencies of the economic regime and that it is necessary to go beyond mere appearances and aggregated growth rates. The Institute of Developing Economies in its study argues as follows:

> The relevant question in the context of this study is the extent to which the government's industrial policy, as revealed in its Five-Year Plans and the Industrial Policy Statement, contributed to this growth. The evidence suggests that growth occurred, not *because* of the specific incentives provided in the industrial policy of the government but *in spite* of it. The outline of industrial policy . . . shows that the cornerstone of government policy was to move towards the higher stages of import substitution (through giving priority to technology-intensive and non-consumer goods manufactures), export enhancement (through increasing the value-added in manufacturing exports and export-led growth) and enhancing efficiency in the manufacturing sector. Given the evidence that we have presented in this section, the goal of import substitution in the intermediate and capital goods sector remained unfulfilled. Although, growth in exports increased the contribution of value-added exports and the composition of manufactured exports remained virtually unchanged through the decade. We also tentatively conclude that the productivity performance was also below par.
>
> *In that case the only achievement of the government was to lure the private sector back into industrial activity. Other than that, it was fortuitous circumstances* (the gestation of public sector projects and the international situation) which was responsible for the above average performance of Pakistan's manufacturing sector.[45]

Asad Sayeed is less charitable in his criticism of the cloaked inefficiencies, and concludes his evaluation of Zia's industrial policy in the following manner:

> The 1978–88 period is unique in Pakistan's economic history for exhibiting high output growth without corresponding improvements in the efficiency of factor use in the manufacturing sector. We saw that much of this growth in output was financed by foreign remittances and aid flows coming into the country. The inefficient use of these resources meant that *the country squandered the windfall gains that it received as a result of favourable exogenous conditions.*
>
> In general, the industrial policy structure of the period was not much different from that pursued in countries which performed markedly better than Pakistan, or for that matter from that which prevailed in the high productivity period of the 1960s. Yet, we also saw that in many cases industrial policy was either not implemented, or the policy structure in some cases was not amenable to productivity growth. The existence of smuggling, the precipitous increase in the number of sick industries, irregularities with the licensing procedures, etc. *pointed towards a failure*

> *in the implementation of policy during this time.* We also saw that policies were not altered even when it was abundantly clear that they were harmful for growth and productivity. In particular, the existence of negative ERPs [effective rates of protection] for certain industries, the regulatory regime of the period and the lack of incentives for value addition in the textile sector were identified as important policy errors.[46]

7.2 The Age of Structural Adjustment: 1988 Onwards

7.2.1 The Principles of the Programme

The history and political and economic background of the role that the IMF and World Bank began to play in Pakistan's economy after 1988 are discussed in Part VI of this book. The present section only examines the relevance of the Structural Adjustment Programme (SAP) to the industrial sector.

The Seventh Five-Year Plan (1988–93) was commissioned at the same time as the IMF/World Bank induced conditionality was accepted by the government in the guise of a Structural Adjustment Programme. The plan had set ambitious targets for overall reforms in the industrial sector, and included further deregulation, privatization, tariff reform, and regulation of foreign investment. As far as the three-year agreement (1988–91) with the IMF was concerned, the industrial policy outlined in the letter of interest committed the Government of Pakistan to the following:

- i) limiting the list of specified industries;
- ii) deregulating business decisions;
- iii) raising the investment sanctioning limit annually [it was to be raised from Rs. 700 million in 1988 to Rs. 1 billion in 1989];
- iv) phasing out industrial location policies over a three-year period and provision of infrastructural services at prices that reflect economic costs;
- v) divesting the shares of public sector companies to the private sector;
- vi) instituting a corporate rationalization programme to enhance efficiency in the remaining, i.e. non-divested, public enterprises;
- vii) considering a realistic trade regime as a primary investment or structural adjustment effort;
- viii) enhancing export incentives;
- ix) reducing the level of protection accorded to different industries;
- x) reducing the list of restricted import items as well as those subject to quantitative restrictions;
- xi) achieving a tariff range of 0 to 100 per cent by 1st July 1990; and
- xii) phasing out all tariff exemptions by 1990/91 except duty drawback for exporters, exemptions for import of capital equipment in key industries and reasonable baggage allowances.

In addition to the industry-specific recommendations, the following prescriptions of the IMF's macroeconomic recipe have a direct impact on industrial development in Pakistan.

- i) an increase in the level of indirect taxation (in the form of a generalized sales tax) by July 1990;
- ii) withdrawal of subsidies on gas, electricity, telephones, and fertilizers;
- iii) an increase in producer prices of major crops (wheat, cotton, sugar cane, rice, and oil seeds) and in the prices of petroleum products;
- iv) a 12.5 per cent reduction in the public sector development programme during the agreement period (1989–1991); and
- v) restriction on government borrowing and credit allocation to the private sector.[47]

The World Bank, in its review of the programme of 1988–91, felt that the economy 'responded well to these policy reforms. Progress in implementing structural reforms to promote private sector activity has been exceptional during the last four years, despite three changes in government during this period.'[48] The large-scale manufacturing sector managed an impressive 7.4 per cent in 1991/2 due essentially to the rapid expansion of cotton manufacture. The World Bank considered Pakistan to have achieved an 'excellent growth performance'.

A major emphasis of the Structural Adjustment Programme was on the enhancement of growth by encouraging the private sector, which was supposed to take a lead role. Amongst the investment and industrial policies followed was a 'forceful' programme of liberalizing the economy from government control. Furthermore,

> not only was sanctioning of private investment and import licensing abolished, but also a number of other regulatory restrictions (including registration of technical and foreign loan agreements, procedures for employment of foreign workers, etc.) were also removed. Areas of investment previously reserved for the public sector were opened to the private sector, including power generation, commercial and development banking, and air and sea transport. [Also], it initiated the privatization of some 105 manufacturing units and began to take steps to expand the privatization programme to the energy and telecommunications subsectors. By November 1992, 67 manufacturing units had been sold and important preparatory steps to privatize the telecoms utility (PTC) and gas utilities were underway. Finally, the Government also provided investment incentives to the private sector. In particular, to promote investment in rural areas, an incentive package, including a five-year income tax holiday, exemptions from customs duty, sales tax and import surcharges, be provided for all industries established in rural areas between 1 December 1990 and 30 June 1995.[49]

According to the World Bank, the consequences of following these policies were as follows (see also Table 7.6):

> Industrial value added grew by 6.3% p.a. during this period. Manufacturing, electricity, and water, which explain most (86%) of this favourable result, expanded by 5.9% and 11.3% p.a. on average, respectively. Large investments in the energy sector led to significant increases in all major energy sources during this period: crude oil grew by 5% p.a., gas by 6% p.a., and electricity by 9% p.a., although power shortages continue to be a significant problem. Construction activity was relatively subdued perhaps reflecting the stagnation in public investment. In manufacturing, cotton industries . . . once again dominated the subsector. However, the strong performance of small-scale manufacturing (which accounts for about one-third of total manufacturing value-added) and non-traditional large scale industries is encouraging.[50]

According to the World Bank's analysis, 'the cornerstone of the Government's adjustment programme is to increase the level and efficiency of private investment and activity by deregulating the economy and promoting competition'[51] (see Box 7.1 for the new rules of credit allocation). There is a very strong emphasis in most Structural Adjustment Programmes on increasing foreign direct investment (FDI) and foreign portfolio investment (see Box 7.2). The Government was urged in 1993 to continue pursuing the private sector agenda aggressively in the coming years, a demand that Pakistan's government was eager to pursue in the next three-year programme of 1993–6 (see Part VI).

While the World Bank and the IMF have concluded that the three-year Structural Adjustment Programmes launched in 1988 and 1993 went rather well—especially in the industrial sector, where the private sector has been the main proponent of the new policies—it is worth ending this section with an evaluation by a neutral party. The Japanese Institute of Developing Economies, comparing actual industrial production with the targets between 1988 and 1992, draws the following conclusions:

Table 7.6
Sectoral Contributions to GDP Growth: 1981–92 (%)

Box 7.1

Credit Allocation for Industry and the New Rules of the Structural Adjustment Programmes

Credit plays a critical role in investment, as the Institute of Developing Economies study shows:

> The allocation and cost of credit to industrial sectors is a key tool for implementing industrial policy. It has been used extensively in countries with active state interventionist policies, to ensure that targeted industries are provided with adequate input of capital to meet their investment and working capital requirements. Multilateral financial institutions, under the influence of neo-classical thinking, have been opposed to the use of targeted and concessional financing, on the grounds that it distorts capital allocation and causes financial repression. Through their structural adjustment loans, they have brought considerable pressure to bear upon the Pakistani planners to phase out concessional credit. The planners, however, are concerned about the effect this would have on the local machinery manufacturing industry and the export sector, which rely heavily on concessional funding. However, to date, no comprehensive analysis of the costs and benefits of concessional financial has been carried out.

Opponents of the scheme point out that while access to export financing has been increasing substantially, it does not seem to have had a corresponding effect on the level of exports, which is primarily determined by competitiveness, quality standards, tariff policy and exchange rate policy. They point out that interest rate subsidies cannot compensate for a lack of competitiveness, poor quality, a discriminatory tariff regime, and an overvalued exchange rate: it merely creates further distortions.

Nevertheless, in an economy where until the recent financial sector reforms, credit was allocated in a detailed manner, through an annual credit plan, access to credit is a vital lifeline. Pakistani industry has always been highly leveraged, relying on debt rather than equity financing for capital investment. First, because it was relatively cheaper on a real post-tax basis, and secondly because it avoided all the legal complications associated with equity flotation. Thus, the volume of credit made available to industrial sectors is a crucial determinant of its output growth.

Source: Institute of Developing Economies, *The Study on Japanese Cooperation in Industrial Policy for Developing Economies: Pakistan* (Tokyo: IDE, 1994), 340.

> The first point revealed by an examination of the data is the extent of variation between targets and achievements, and the number of products that were subject to them. We note, for example, that the variations affect up to 30 products for which data were available and range from a deficit of 75% to an excess of 1013%. The corresponding growth rates also show large variations. The second fact that becomes immediately apparent is the degree to which variations match the difference between revised and original targets for the plan. *It appears that planning in Pakistan is really an ex-post exercise. In other words, as the planners realize that their original targets are not being met, they revise the targets to more closely approximate likely outcomes.* Thus, in 1992, the planners readjusted their targets, in light of the data on actual production as of that year, so that it could be said at the end of the plan period that targets were accomplished. This is really an exercise in self-deception. No attempt, it appears, is made to find causes for variations, or solutions to overcome the problems identified. Objectives are outlined, targets set, and then the planners await, with bated breath, the ultimate outcome! The monitoring of plan outcomes is not done in a periodic and systematic manner.[52]

For further analysis of policies and their consequences under the Structural Adjustment Programme, see Part VI.

7.2.2 Assessing the Impact on the Industrial Sector

Although some analysis takes place in Part VI of this book on the overall impact of the Structural Adjustment Programme, and while we analyse recent trends since the late 1990s to the present in Chapter 18, it is worth our while focusing primarily on the industrial sector since the 1990s in this chapter. Table 7.7 shows how much lower the growth rate of manufacturing was in the 1990s compared to the 1980s, falling from a very impressive 8.21 per cent average annual increase over the decade, to only 4.8 per cent for the average of the 1990s. Moreover, in the last five years of the 1990s, the growth was only 3.22 per cent. In 1996/7 the growth for the industrial sector was *minus* 0.1 per cent, and was only 1.5 per cent in 1999/2000. Clearly, this was a worrying trend at that time. However, in the period after 1999, for the average of the period of the decade of the 2000s (1999/2000–2009/10), we see a huge shift in growth in the manufacturing sector, to a decade average of 7 per cent, clearly a phenomenal growth, the highest in manufacturing since the decade of the 1980s. In fact, there were some years when manufacturing growth in this decade grew by as much as 14 per cent (2003/04) and even higher, 15.5 per cent in the next year, 2004/05. The high average for the decade of the 2000s is even more striking, because towards the end of that decade, towards the end of the Musharraf regime, in 2007/08, and in the years of the People's Party government, the manufacturing growth rate, as well as that of the overall economy, took a sharp nosedive. In fact, in the first year after Musharraf's ouster, in 2008/09,

Box 7.2

The Policy Initiative to Attract Foreign Direct Investment (FDI)

The World Bank documents Pakistan's attempts to attract FDI:

> Since late 1990, the Government in Pakistan has initiated a number of policy and regulatory measures to improve the business environment in general and attract FDI in particular. The requirement for Government approval of foreign investment has been removed and 100 per cent ownership is permitted, with the exception of projects in industries included in the Specified List, which are: (a) arms and ammunition, (b) security printing, currency, and mint, (c) high explosives, and (d) radioactive substances. Foreign investment remains prohibited in the areas of agricultural land, forestry, irrigation, real estate, insurance, health, and related services. In the petroleum subsector, the Government enacted a new Petroleum Policy which is significantly more conductive to foreign investment than previous policy guidelines. Foreign firms can now also engage in export trading activities. Previously, the Provincial Governments had to issue a No Objection Certificate and effectively controlled the physical location of the investment. Now, these governments limit their a-priori approval only to so called negative areas. Furthermore, the elaborate controls that used to be imposed on the transfer of technology have been entirely removed. Technology buyers face no ceilings over the amount of royalties and technical fees they are allowed to pay.
>
> One of the most important measures taken recently by the Government affecting FDI was the liberalization of the foreign exchange regime. Residents and non-resident Pakistanis and foreigners are now allowed to bring in, possess and take out foreign currency, and to open accounts and hold certificates in foreign currency. Foreigners using foreign exchange have now access to the capital market. For example, no permission is required to issue shares of Pakistani companies to foreign investors, unless they belong to industries included in the Specified List. Remittance of principal and dividends from FDI and from portfolio investment made by foreign and non-resident Pakistani investors are allowed without prior permission or clearance from the State Bank of Pakistan (exceptions: foreign airlines, foreign shipping companies, insurance companies).
>
> Export incentives have been introduced or broadened. The highly cumbersome duty-drawback system is being replaced with a scheme whereby 80 per cent of the duty-drawback is paid automatically within three days to the firm, and the remaining 20 per cent is paid within one week after inquiry. Moreover, import policy has been partially liberalized: the average import duty on raw materials was lowered, a large number of quantitative restrictions and non-tariff barriers were removed, and the negative and prohibited lists of imports were reduced. Finally, the 55 per cent income tax rebate on export earnings was changed into a 75 per cent rebate for export of high value-added products, and a 50 per cent rebate for all other products. As in the case of investment incentives, these rebates may not be cost-effective and generally lead to distortions in the incentive structure.
>
> The Government has also enacted an extensive set of investment incentives including tax holidays for projects in rural and underdeveloped areas. Imported machinery not manufactured locally is fully or partially exempted from import duties, depending on whether a project is located in a rural area, underdeveloped areas, or industrial estates. A variety of other fiscal and monetary incentives are offered for projects in selected industries like electronics, tourism, pharmaceutical, dairy farming, mining, engineering, fertilizer, and cement. Experience in other countries generally indicates, however, that these kind of incentives are not cost effective.

Source: World Bank, Pakistan: *Growth Through Adjustment*, Report No. 7118-Pak (Washington DC: World Bank, 1988), 40.

the growth rate for the manufacturing sector was *minus* 3.6 per cent! The manufacturing sector has struggled since then and did so in all the years of the Pakistan People's Party regime from 2008 onwards. There are many reasons why the manufacturing sector and the economy overall, witnessed such a boom in some of the Musharraf years, and why they both collapsed after 2008 or so.

Many of these reasons are explained in detail in Chapter 18 and in Chapter 25, but the main reasons why the manufacturing sector and the economy grew in the decade of the 2000s after the dismal performance of the 1990s were as a consequence of the windfall gains on account of 9/11 and especially, the rescheduling of Pakistan's debt following 9/11. The fall In manufacturing after 2008, came about because of the change, not just from one government to another in Pakistan, but from a transition from a military dictatorship to a democratically elected government and all the consequences related to such a transition. Furthermore, the consequences of the War on Terror brought home very violent repercussions for Pakistan's society and economy, and affected investment and growth. To add to Pakistan's specific problems, was also the global recession which began in 2008, and the phenomenal rise in world oil and food prices. While the People's Party government of 2008–13 inherited difficult global conditions which were not conducive to growth and also had to deal with serious political and terrorist-oriented conditions at home, one cannot deny the fact that its own poor performance and the lack of a vision and clarity, also played a significant role. Many of these issues are discussed further in Chapter 18.

Other trends in the industrial sector in the 1990s and after, only reconfirmed the deteriorating condition of industry in the country. For example, fixed investment, as a percentage of GDP in 2002/3 was only 13.1 per cent, down from 19 per cent

Table 7.7
Key Indicators in the Industrial Sector: 1990–2012

Note: base year changed from 2000–01. P = provisional

in 1992/3, falling gradually and noticeably each year. With the privatization programmes of all governments since 1988, it is not surprising that public investment at 4.5 per cent in 2002/3 was half of what it was in 1988/9. What is more disturbing is that while all governments have been relying on the private sector to lead Pakistan to higher levels of development, private investment as a percentage of GDP, also fell from around 10 per cent in 1992/3 to around 8 per cent after 1998/9. Most startingly the Gross Fixed Capital Formation (GCFC) in the private sector in the large scale-manufacturing sector in 1980/1, in constant prices, fell continuously over the 1990s, by as much as 60 per cent between 1991/2 to 1998/9—see Table 7.7.

After the 1990s, most of these investment and manufacturing indicators improved substantially. In the decade of the 2000s, both total investment and fixed investment grew by rates which were even higher than in the 1980s when a great deal of investment and growth took place. However, what is interesting is that in the 1980s, public investment as a percentage of GDP, was higher (9.2 per cent) than private investment (7.8 per cent), showing the large scale public development made in that decade. *The structure of the economy had shifted markedly*, when despite overall higher investment in the 2000s, it was private sector investment which was the main motor of investment in Pakistan, and was almost three times as much as public investment (12.6 per cent compared to only 4.8 per cent). There has been a continuous drop in public investment since the 1970s where public investment is now less than one-third of what it was on average in the 1970s (3.3 per cent in 2010/11 compared to 10.3 per cent for the 1970s). Private investment in the 1970s was a mere 5.6 per cent for reasons which were explained in the last Chapter. In the 2005–08 period, private investment was above 15 per cent.

This trend marks a very clear shift in the dynamics of investment in Pakistan. The private sector is now the lead sector in investment, unlike for the first four decades of Pakistan's existence. This factor might also explain the very dismal performance of manufacturing and of the economy, more generally, since the collapse of the Musharraf regime and with him, in the economy. Public investment has been falling steadily over the last few decades, down to around 3.3 per cent of GDP in 2010/11. As a consequence, it seems now that growth and investment is now to be lead by the private sector. If this is the case, then it seems that growth and investment in Pakistan will depend on incentives to the private sector and on conditions in which the private sector is willing to invest. Clearly, conditions in Pakistan since 2007, on account of the War on Terror, will not be attractive to the private sector, and only the public sector can provide new investment. This dependence and reliance on only the private sector, when privatization has taken place and the role of the state has diminished, will mean that manufacturing and new investment will tend to be much lower, and more incentive- and condition-specific, and hence more wayward, than had public sector lead growth and manufacturing.

The numbers above reveal the stark reality, that the industrial sector has suffered since the neo-liberal Structural Adjustment Programme was initiated in 1988 and only extraneous and fortuitous circumstances after 9/11, were able

to reverse that trend. Moreover, once the benefits of those factors was lost due to another round of post-9/11 factors, we are back at the same place before 9/11. Many scholars who have looked at this Programme in any detail and have tried to link it with the performance of the economy overall, do not claim with complete certainty as proof that this slowing down in the economy is a *direct cause* of adherence to the adjustment programme—for there are many other reasons as well—but they do clearly and convincingly show *association* and a *clear link, especially with regard to manufacturing and industry.*[53]

We can demonstrate this link and association by looking at numerous policy interventions on account of the Structural Adjustment Programme and their consequences on industrial inputs and performance. For example, if we examine the cost of borrowing—the rate of interest—to borrowers of capital, we will see how reforms in other sectors impact upon the industrial sector. From an average of 12 per cent in 1990, the rate of interest for financing long term industrial investment rose to an average of 20–23 per cent by 1997. The interest rate on working capital also increased to 25–30 per cent in the same period.[54] The rate of interest in Pakistan was a controlled and regulated rate which was kept low—around 6 per cent—in the 1980s, was 'liberalized' (increased) and supposedly made market determined as a consequence of 'reforms' in the financial sector.

Similarly, freeing up of the prices of utilities—let the market decide—forced prices up for gas, electricity, and petroleum inputs, all having an impact on final products. Electricity prices rose by 14.7 per cent per annum between 1991–2001, while gas rose by 10 per cent and the price of petrol was above Rs. 100 in 2012, from Rs. 13 in August 1993. This 'rationalization' of the utility pricing structure has undeniably had an impact on industrial costs and competitiveness. Add to this that tariff rates have fallen drastically from a maximum of 225 per cent in 1986/7 to 25 per cent currently making imported goods cheaper, it is then not surprising that more than 4,000 industrial units were declared 'sick' and overall industrial production has been what it was in the 1990s, and has been after the Musharraf artificial and unsustainable 'boom', which came to an end in 2007—see Box 7.3.

Box 7.3

IMF Conditions Derail Textile Vision 2005

This news item from *Business Today*, 3 June 2001, identifies how the Government's Textile Vision 2005 strategy unveiled with much fanfare in May 2000, came undone as a consequence of IMF conditionality.

'While the government intends to provide soft-term loans to the textile industry, under Textile Vision, the IMF wants elimination of all such credits in future. This will put an end to an ambitious textile export promotion programme envisaged by the sitting government' officials said. Sources in the Ministry of Commerce, say the government and the International Monetary Fund have dissenting views on the provision of concessional credit to the export-oriented textile manufacturers.

'With the advent of World Trade Organization (WTO) agreement and subsequent elimination of quota system by the year 2005, Pakistan's textile manufacturers will be facing enormous challenges to market their products globally, without the availability of soft-term loans both for running finance and export refinancing,' sources said. Another key objective of the vision is to enable the industry to acquire modern technology for value-addition of textile products that can substantially help indigenous textile manufacturers meet upcoming challenges of free-trade beyond the year 2005.

The Ministry of Commerce has envisaged credit at exceptionally low mark-up, and other fiscal incentives, such as speedy refunds of taxes, availability of export finance facility at subsidized rates, and duty free import of textile-related machinery. But the domestic banking sector has, on one hand, refused to lend to the textile industry at very low interest and on the other hand, has enhanced the rate of mark-up on the export refinance scheme, leaving the textile manufacturers high and dry.

Meanwhile, in a bid to meet the tough revenue target, the Central Board of Revenue has neither provided any significant tax relief to the textile sector, nor has it paid billions of rupees in refund to the textile exporters on time. To meet the shortfall in tax revenue during the first half of this fiscal year, CBR withheld refunds of more than Rs. 15 billion, creating a liquidity crisis for the entire export industry in the country, which ultimately slowed down the growth of exports in the later months.

The banks are not in a position to provide adequate credit at exceptionally low mark-up. The textile manufacturers are also not willing to take huge loans at the market-based interest rate, says a source.

After the approval of the Stand-By Arrangement (SBA) by the IMF, Pakistan has started phasing out subsidies to the export industry and all the other sectors of the economy. Consequently, the banks have enhanced the mark-up rate on the export refinance scheme, while by the end of June this year the banks would completely withdraw subsidy on the said scheme.

To the utter dismay of Pakistani textile manufacturers, their arch rivals India and China have already started extending elaborate financial credit and incentives to their indigenous industry. Recently, a delegation of the Indian Textile Machinery Exporters Association, that visited Pakistan, informed that their government was giving a huge subsidy to the textile industry in the form of credit and other fiscal benefits so that the industry could produce quality products at competitive prices.

The Lahore-based exporters, maintained that the abolition of subsidies would serve no purpose but create difficulties for the indigenous industry.

'Instead of blindly pursuing the policies of the IMF, the Government should try to revive the local industry so that the economy could be put back on track,' said the two businessmen. The textile industry has fetched around $550 million additional foreign exchange last fiscal, while during this fiscal, this sector is expected to attract even more through exports. 'The textile sector can double its exports within the next three to four years, provided it is given adequate credit to implement its balancing, modernization, and replacement (BMR) plan,' a Commerce Ministry official said.

Source: *Business Today*, 3 June 2001.

These are just some of the 'reforms' undertaken since 1988 which have had an impact on Pakistan's economy and on the industrial sector—also see Part VI. With the advent of WTO and with increasing competition and globalization, Pakistan's future prospects in the industrial sector seem challenging, if not bleak—see Chapters 8 and 9 as well. We must also hold the governments of General Musharraf and the one which followed it, of the Pakistan People's Party, responsible for creating an energy crisis, especially by the latter government, which has led to a further collapse of the industrial and manufacturing sector, an issue discussed further in Chapter 8 and Chapter 18.

7.3 Summary and Further Reading

7.3.1 Summary

During 1977–88, industrial development regained the momentum that was lost between 1972 and 1977, and growth rates of industry and of the economy returned to the historically high levels of the pre-Bhutto era. For this reason, and also because both Ayub Khan and Zia ul-Haq were military dictators, there are quite a few similarities in the process of development in the periods of their rule. The private sector returned to Pakistan after the Bhutto years and began to play a key role in industrialization.

Zia reaped many rewards that resulted from the initiative of his predecessor, and fortuitous circumstances, too, helped in establishing and maintaining an economy with very high growth. A number of public sector projects came online, and the Middle East boom in this period resulted in workers' remittances of as much as $3 billion in one year easing any strain on the economy. The Soviet invasion of Afghānistan resulted in Pakistan acquiring the (dubious) title of 'frontline state', with military and financial aid, again reminiscent of the Ayub era, flowing into Pakistan. Not only did large-scale production play an increased role as it did under Ayub, but the small-scale sector, due to Bhutto's policies, showed dynamic growth in the Zia period.

After General Zia's death, the democratic transition was matched by a new economic order, and Pakistan entered the world of the Structural Adjustment Programme, under the careful eye of the IMF and World Bank. The eleven years of high growth under Zia clearly unravelled, and the high expectations of the Structural Adjustment Programme were not fulfilled in the 1988–99 period when electoral politics returned to Pakistan. It was only after 9/11, under Pakistan's third military dictator, that growth rates in the industrial sector, in investment, and of the economy picked up. As we argue in Chapter 18, this was only on account of the windfall gain which accrued to the Musharraf regime after 9/11. The other, negative, repercussions of Musharraf's policy after 9/11, were brought home as his regime was coming undone, and growth rates, of the economy, investment, and manufacturing, fell sharply. Changed domestic and international factors also affected Pakistan's economy, but so did the policies of the People's Party government, particularly its inability to deal with the energy crisis—also see Chapter 18.

7.3.2 Further Reading

Probably the most outstanding work on the subject is: Asad Sayeed, 'Political Alignments, the State and Industrial Policy in Pakistan: A Comparison of Performance in the 1960s and 1980s', unpublished PhD dissertation, University of Cambridge, 1995. Other useful texts include Omar Noman's *The Political Economy of Pakistan, 1947–85* (London: KPI, 1988); Nasim, Anjum, (ed.), *Financing Pakistan's Development in the 1990s* (Oxford: Oxford University Press, 1992); UNIDO: *Pakistan: Towards Industrial Liberalization and Revitalization* (Oxford: Blackwell, 1990); the Institute of Developing Economies' *Study on Japanese Cooperation in Industrial Policy for Developing Economies: Pakistan* (Tokyo: IDE, 1994); S. N. H. Naqvi and Khwaja Sarmad's manuscript, *External Shocks and Domestic Adjustment: Pakistan's Case, 1970–1990* (Islamabad: University Grants Commission, Monograph Series, 1994); Khan, Shahrukh Rafi (ed.), *Fifty Years of Pakistan* (Karachi: Oxford University Press, 1999), and his *Do World Bank and IMF Policies Work?* (London: Macmillan, 1999) are essential reading. Parvez Hasan's, *Pakistan's Economy at the Crossroads: Past Policies and Present Imperatives* (Karachi: Oxford University Press, 1998), Asad Sayeed and Saba Gul Khattack (eds.), *Women's Work and Empowerment Issues in an Era of Economic Liberalization* (Karachi: PILER and SDPI, 2001) and Shahida Wizarat's *The Rise and Fall of Industrial Productivity in Pakistan* (Karachi: Oxford University Press, 2002) are also worth reading. The unpublished doctoral dissertation by Ali Cheema, 'Rent-seeking, Institutional Change and Industrial Performance: The Effect of State Regulation on the Productivity Growth Performance of Pakistan's Spinning Sector 1981–1994', University of Cambridge, 1997, is also an excellent source for looking at the industrial, and particularly textile, sector in a political economy framework. Finally, three earlier reports prepared by the World Bank on changes since 1988 should also be consulted: *Pakistan, Growth Through Adjustment*, Report No. 7118-Pak (Washington DC, 1988); *Pakistan: Medium-term Economic Policy Adjustments*, Report No. 7591-Pak (Washington DC, 1989); and *Pakistan: Country Economic Memorandum FY93: Progress Under the Adjustment Program* Report No. 11590-Pak (Washington DC, 1993).

The *Final Report of the Panel of Economists: Medium-term Development Imperatives and Strategy for Pakistan*, commissioned and published by the Planning Commission, Government of Pakistan, April 2010, and the extensive study by Abid Burki et al. *Industrial Policy: Its Spatial Aspects and Cluster Development in Pakistan, Volume I, Analysis Report to the Industrial Policy 2010* (Lahore: LUMS, 18 October 2010).

Appendix 7.1

The Emergence of a New Breed of Entrepreneur under Zia

This article by Asad Sayeed tries to compare the change in the nature of entrepreneurs from the time of Ayub Khan to the end of the Zia period.

If the Habibs, the Saigols, the Valikas, Ispahanis, and Fancys were considered role models for budding businessmen during the 1950s and 1960s, today's corporate kingpins like the Lakhanis, the Sharifs, and the Hashwanis have become the idols of aspiring yuppies at the business schools of Karachi and Lahore in the 1980s.

The last decade has seen a significant transformation in the country's industrial élite, as a result of the separation of East Pakistan and the nationalization policy of Zulfikar Ali Bhutto's regime. This is not to say that all the big names from the original '22' have literally gone under. In fact, if one goes by the financial assets listed on the stock exchange some of the industrial giants of the pre-nationalization phase—like the Habibs, the Dawoods, the Saigols, the Crescent group, and the Wazir Alis—continue to occupy prime positions on top of Pakistan's corporate ladder.

But according to most observers of the country's corporate scene, the list of industrial giants would have been quite different if some of the new groups—like the ubiquitous Sharifs of Lahore, the FECTO group, Captain Athar's Schon group, and a horde of other textile empires—had all their companies listed on the exchange. 'I believe that if one was to sum up all the net worth of say, the Ittefaq group, they would certainly be way up among the top 5 industrial giants of the country,' says a veteran observer of Pakistan's corporate scene. He goes on to say that 'the big groups in Pakistan have always held way above the majority of shareholdings required for controlling the management, and with liberal credit available from DFIs, it does not make any real difference to them if they do not seek equity from the stock market.' It seems that the new industrialists have learnt from the tumultuous '70s when Zulfikar Ali Bhutto used the 'big 22' phenomenon as a major rallying point to come into power and subsequently nationalized many of the big industries.

However, there are some other important ways also in which the new guard is clearly distinct from the old. For one thing, almost all of the big entrepreneurs of the '80s have adopted aggressive marketing and advertising strategies. But while this high-profile corporate strategy may apply to their marketing activities, as mentioned earlier, the opposite is true about their financial standing. While it was a matter of pride for the older industrial giants to be listed on the exclusive club of the 'big 22', their lifestyles were conversely, far less ostentatious than the conspicuous consumption pattern that has become characteristic of the more nouveau brand of financial tycoons today. Financial savvy now amounts to carefully protecting all the particulars of one's financial worth, especially if some of the wealth has been fashionably fuelled through this decade's business obsession of under and over-invoicing.

Another legacy of the Bhutto years—the labour laws—have made the mode of operation of Pakistan's industrial sector in the 1980s different from that of their predecessors. The introduction of the old-age benefit scheme, social security, medical cover, and a limitation on the discretion of the employers to hire and fire, has increased the costs of the employers by considerable proportions.

While the corporate generation of the 1960s could happily amass fortunes without being saddled with such 'oppressive' legislation, the new lot has dealt with these laws in quite an ingenious manner. Instead of hiring their labour force on a permanent basis, the industrial sector of the 1980s has resorted to the now popular practice of hiring it on a contract basis. By doing this, they manage to sidestep another major impediment in the way of accumulating huge profits.

However, boasting palatial houses or gleaming limousines these days is not just the hallmark of the business magnates aspiring to become socially indispensable, or of the powder-kings with not enough places to spend their highly liquid drug money. These are also some of the crasser symbols of bourgeois bounty flashed around by a whole new breed of export-led trade magnates. Indeed, it might even be true to say that the 1980s has seen the proliferation of a new class of entrepreneurs who can match their big brothers in business in terms of conspicuous consumption. These 'businessmen' are mostly exporters of value-added goods like garments, leather products, rugs, and other items which have an exotic appeal in the western world and Japan.

These exporters—with leading names like Ilyas Malik, Mohammed Saeed, Mohammed Hussain, Khalid Javaid, S. Mohammad Din, Aziz Brothers, and Haji Abdul Latif—have grown and prospered partly as a result of changing governmental priorities, like the devaluation of the rupee. In particular, they have been quick to reap profits from concessions like the very liberal export policy with massive rebates for value-added exports and, like their counterparts in big industries, they have also extorted huge profits by cutting down on labour costs. Instead of relying on the traditional factory-oriented method of production, many exporters have gone for sub-contracting their production to the small power and handlooms, tanneries, and weaving units in the informal sector.

While, on the one hand, this arrangement has made it possible for these exporters to keep their overhead costs low, on the other, it has effectively kept the workforce out of the ambit of labour laws. Thus, with their fixed assets working out as almost negligible on paper, they have been able to make an average profit, which ranges from 400 to 700 per cent per unit of exports.

But despite these differences in the two different generations of corporate élites, it is not entirely wrong to say that they have essentially made it big by riding on the back of the country's bureaucracy.

Most observers of the first industrial boom assert that the infamous 22 families of the 1960s were more a product of state patronage, rather than that of any intrinsic entrepreneurial

genius. Which leads one to wonder if the new business brass has also made it big by accumulating a large share of their booty through the assiduous cultivation of the bureaucracy—who are notorious for not being averse to scratching others' backs if theirs are kept well groomed. Certainly, there can be no denying that the role of the country's establishment in the concentration of industrial assets has remained almost as significant as it was during the industrial boom of the 1960s. If at that point during the 'decade of development', the nascent industrial class of the country was provided easy capital through state-owned financial houses like the PIDC, PICIC, and ICP, the new breed have not exactly been starved of liberal loan windows through nationalized banks and the many DFIs which have been created over the last 15 years (NDFC, BEL, etc.). Similarly, the famous bonus voucher scheme of the 1960s and the overvalued rupee—mechanisms for easing the import of raw materials and export of finished products have taken on the guise of excise and export tax rebates, and import of capital equipment at lower duties. Apart from obtaining these concessions which are general to the industrial sector, big business has essentially thrived by maintaining a close rapport with the top echelons of the bureaucracy—an arrangement which has occasionally been disturbed during the brief interludes of parliamentary democracy in the country.

Another similarity between the élites of the two different eras is that the big industrial conglomerates have backed their industrial and personal assets by floating insurance companies and banks. After the nationalization of all banks and the major insurance companies during the Bhutto era, it took some time for the new groups to commit so much capital to venture in the financial market. But despite memories of the Bhutto squeeze, over the last 10 years almost all the big groups—the Habibs, the Dawoods, the Adamjees from the old lot, and Hashwani, Lakhani, Shirazi, and Firdous groups—have managed to set up insurance companies or modarrabas. The Crescent group is the first which has recently launched its own investment bank.

In terms of industries again, there seems to be little difference in the product mix of the two eras. Like in the past, most of the industries are essentially textile based. Some of the new names have, however, distinguished themselves by venturing heavily into areas like hoteliering (Hashwanis), steel (Sharifs), auto assembly and light engineering (the Atlas and Sony groups).

The picture that emerges out of the present set-up of corporate activity then, is that it continues to be essentially patronized by the state, which not only supports this group, but also turns a blind eye to its numerous illicit practices.

Since the onset of parliamentary democracy in 1985, however, many politicians have been going into industry in a big way—with some leading names like the Saifullahs, Zarri Sarfaraz, and the late Mohsin Siddiqi. And if the present trend continues, one wouldn't be too far off the mark in conjecturing if the '90s is going to see the new breed of politicians-turned-industrialists pushing out the present tycoons to gain a higher position near the top of the corporate ladder.

Certainly, if one is to go by the business community's recent protest marches and convention jamborees, which embodied its threat to boycott government revenues and withdraw advertisements from the electronic media, it is becoming increasingly clear that they are not exactly going to lie low while the feudal politicians sweep away the fruits of their financial standing. There is little doubt in any business observer's mind that, given the present aggressive posture of the business community, it seems that this time they will pre-empt the traditional politicians' move to keep the reins of power in their hands by carving out a political niche for themselves.

8 Key Issues in Industry in Pakistan

The previous two chapters have given a chronological account of developments in the industrial sector in Pakistan, showing how the differing perspectives of different regimes have influenced industrial and economic growth. This chapter looks at contemporary issues in the industrial sector, including privatization, the textile sector and a host of others, especially energy shortfalls and implications for the industrial sector. Many of the issues in the industrial sector today have their roots in policies adopted many years ago, so much so, that some analysts and experts blame the problems of today on key decisions of yesteryear.

8.1 Numbers and Trends in Industry

The phenomenal growth rate experienced in the industrial sector in Pakistan in the early 1950s took place, from an almost non-existent base, where the growth rate of the industrial sector was doubling itself every few years. The extraordinary growth rates of over 20 per cent between 1950 and 1955 in large-scale manufacturing were achieved primarily because very little existed to start with and, hence, any investment and production, no matter how little, would register impressive gains. Only in the early 1960s did large-scale manufacturing come close to the extraordinary period of the early and mid-1950s. Nevertheless, overall manufacturing did manage to produce a growth rate of close to 10 per cent on average throughout the 1960s (Table 8.1), followed by a substantial reduction in the 1970s, the reasons for which were discussed in the previous chapters. The 1980s once again saw a return to a very impressive annual average growth in manufacturing of 8.21 per cent, a fact which received much recognition by international agencies and independent analysts and scholars (see Chapter 7). The roller-coaster, boom/bust, trend of industrial and manufacturing growth, was witnessed again in the 1990s, when growth fell after the 1980s, to be revived again after 9/11, and to fall again after 2007 for a host of reasons discussed in the previous chapter.

A trend which is striking for its monotony is that exhibited by the small-scale sector. The first few years, 1950 to 1962, show a consistent trend of 2.3 per cent annual growth, followed by a growth rate of 2.9 per cent over the next eight years, with the Bhutto period registering an annual growth rate of 7.3 per cent. From 1977 until the 1990s, we witness a consistent trend of 8.4 per cent; from the 1990s this trend rate falls to another consistent 5.3 per cent, following which after some variation, the growth rate of the small-scale sector stays at 7.5 per cent from 2000–12. This trend seems too consistent for it to be of any real substance. In fact, the growth rate for the small-scale sector is not calculated, as it is for the large-scale sector, and is merely imputed or assumed. Every few years, a readjustment in the annual growth rate is made to reflect a more realistic trend. However, as discussed in section 8.2 the small-scale and informal sector is much more dynamic and productive than the government's figures

Table 8.1
Growth Rates in Manufacturing: 1950–2012 (% Increase at Constant Factor Cost)

Sector	1950–1959	1960–1969	1970–1979	1980–1989	1990–1999	2000–2009	2010–2012P
Industrial Sector	8.9	9.7	6.6	8.2	4.7	5.3	–0.6
Mining & Quarrying	10.5	8.4	4.8	9.9	3.3	17.8	1.0

show, and in fact, with the large-scale manufacturing sector stalling or even failing, it might just be the backbone of what constitutes manufacturing and industry in Pakistan. Moreover, since this estimate for the small-scale industrial sector is on the low side, this implies that so too would be the figure for overall manufacturing, which is based on both large- and small-scale industry. Furthermore, we argue in the next section that not only is the small-scale sector more dynamic on its own, but many activities previously undertaken in the large-scale sector have shifted to the small-scale sector—textiles in particular. The implications of this are that, unless a correct annual estimate of the small-scale sector is made, the growth rate reported for the overall manufacturing sector will always be on the low side. In fact, as the small-scale sector prospers, the extent of error in the sum for overall manufacturing will increase unless proper figures are made available.

Like manufacturing growth, which has seen some important fluctuations, the growth rates of the mining and quarrying, construction, and electricity and gas sectors have been equally volatile. Construction, in particular, has experienced huge growth in one year, followed by negative growth in the very next year. This fluctuation in construction could be due to the commissioning of large projects in one year followed by fewer or no projects the following year. Dams, power plants, and other large public (and now private) sector projects would show huge investments for one or two years in a row, followed, not surprisingly, by lower or even negative growth rates. For example, in 1960/1 the growth rate of construction over the previous year was an astronomical 43.3 per cent, followed by –2.6 per cent in the subsequent year. From 1977 onwards, and especially since the mid-1980s, the annual growth in construction was positive, and the extent of fluctuation was small. In fact, for all the sectors, the extent of fluctuation decreased after about the mid-1970s. However, fluctuations in the growth of the construction sector became particularly volatile in the 2000–12 period growing by 56 or 59 per cent in one year, to register a negative growth of 26 per cent a year or so later. The construction sector saw a growth of more than 10 per cent in 2005/06 and 2007/08, but –8.6 per cent in 2010/11, with annual growth rates of –10.7 per cent in 2003/04 and –11.2 per cent in 2008/09.

Gross fixed capital formation (GFCF) is the value of capital stock at a particular time. In Table 8.2 (Panel a) the GFCF is presented for a number of years in current prices, and so is not strictly comparable. GFCF can double over a period of time, simply if inflation doubles. However, we can compare the distribution between the private, public, and government sectors. The table shows, as has been argued in previous chapters, that the private sector led growth in industry and the economy through much of the 1960s and again in the 1980s. The public sector dominated in the 1970s and the role of government also increased in the same period. However, since the 1980s, the private sector has begun to dominate GFCF and has increased its role to around three-fourths of the total. It is probable that, with further privatization and the involvement of the private sector in areas which were once the exclusive terrain of the public sector, in future years the role and contribution of the private sector in the economy and in GFCF will grow at the expense of the public sector.

The lower panel of Table 8.2 shows the contribution of both the public and private sectors to GFCF. The shift towards the private sector in most fields is quite noticeable, mainly for the reasons listed above. Large-scale manufacturing now takes place almost exclusively in the private sector as does small-scale manufacturing, and with pro-private sector policies and denationalization, the private sector is playing a much greater role in construction and the electricity and gas sector.

Table 8.3 shows the index of production in manufacturing, while Table 8.4 shows the distribution of production by the main sectors since the early 1970s. Textiles, not surprisingly, dominate, with the food sector also contributing a fairly large share. The pattern since 1969/70 shows that a number of new industries have come online which did not exist in the early and mid-1970s. Most notably, petroleum refining, the ginning, pressing and baling of fibre, transport equipment, industrial chemicals, and a number of other products now contribute a great deal to production. Nevertheless, one-quarter of total industrial production as measured by value addition—Table 8.5—is still textile production, and if we add other cotton-related activity, its share increases further.

A similar picture emerges when we consider the value-added by industry, as Table 8.5 shows that the contribution of textiles increased from about 17 per cent in 1987/8 to 26 per cent of all value-added by industry in 1990/1 where it has remained. The data in Table 8.5, based on the Census of Manufacturing Industries, are available only up to 2005/06 when the last CMI census was held. It is difficult to say what contribution textiles make currently, given the crisis which has engulfed them (see section 8.3 below). Table 8.6 shows the annual growth for some industrial items, and the most marked feature of the table is the phenomenal growth of the 1950s. An equally interesting feature is the very high fluctuation in these items since the 1990s well into the 2000s, where very impressive growth in one year is followed by negative, or low, growth in the next. One important exception is output of cotton yarn, which, although it has fluctuated, has shown impressive growth rates for most of the last decade, although since 2007, like much in the economy and industrial sector, has tumbled rather sharply.

Table 8.7 concludes this section on facts and figures in industry with the average daily employment in major industrial sectors. The striking feature of this table is that, while the overall population of Pakistan almost doubled between 1969 and 1990, the number employed in industry went up by less than half. The reason for this could be that industry became more capital intensive. But this is unlikely, given the output and production trends shown in earlier tables. Another reason could be that the figures listed in Table 8.7, which are for the formal sector only, do not show the trend towards the small-scale/informal sector that took place in the 1980s. Although there may not have been a complete shift of industry from the large scale to the small, larger growth in the small may have captured the increase in the labour force (see section 8.2). It is also possible that, to circumvent labour legislation, employers have preferred to hire part-time, non-unionized, contract workers, rather

than formal employees. Nevertheless, whatever the cause of the slow growth in employment, all the figures presented in this section show somewhat alarming trends and are cause for serious concern and urgent redress. Unfortunately, more recent data are not available.

8.2 The Small-Scale Manufacturing Sector

Much of the discussion that has taken place in this book with regard to the process of industrialization in Pakistan (Chapters 6 and 7) has revolved almost exclusively around the large-scale manufacturing sector. For most people, the image of industry is one where there are large plants either run by machines, robots, or the computer, or employing hundreds, if not thousands, of workers. Thus, it comes as a surprise to many people when they discover that it is not the large-scale manufacturing sector that provides employment to most workers in the industrial sector, but the small-scale or informal sector[1] that dominates our lives. The small-scale sector is, by far, the more dynamic, exhibiting impressive growth rates in employment, output, and contribution to value-added.

8.2.1 Numbers and Characteristics

Table 8.8 gives us a picture of the informal sector between 1972 and 1986 in urban Pakistan. While there was little change over the fifteen years as a whole, and the share of the informal sector increased only slightly from 69.1 to 72.7 per cent, the actual numbers of those employed have increased by more than 72 per cent, from 2.8 million in 1972 to 4.9 million in 1985 (Table 8.9). This shows an annual increase of 4.3 per cent in employment over this period. During 1976–83, the peak growth of the small-scale sector (see below), the annual real growth rate in employment was as high as 10.3 per cent compared with the *negative 1.1 per cent* for the formal sector in the same period. All recent evidence seems to suggest that this trend has been further accentuated.

A look at Table 8.8 reveals that the informal or small-scale sector has dominated employment in the construction, wholesale and retail trading, hotels, transport, communications, and storage industries in urban Pakistan since at least 1972. However, probably the most interesting feature of the table is the fact that in 1972/3 the formal sector dominated urban employment in manufacturing, but by 1984/5 the informal sector had begun to dominate urban manufacturing in an unprecedented manner. Clearly, given the scale of the small-scale and informal sector, it can 'hardly be termed as marginal to the economy, provider of "employment of the last resort", or as a temporary sponge to absorb new migrants entering the urban labour market and seeking formal sector employment'.[2] The small-scale sector is not only here to stay, but will continue to play an increasing and critical role in a number of areas in the urban economy, and as Chapter 5 showed us, the non-agricultural sector in rural areas which plays such a large part in rural incomes, is also comprised largely, of the small and informal sector.

In the urban manufacturing sector, which mainly concerns us here, *as many as 98 per cent of manufacturing units were small-scale unregistered firms*, and in terms of urban manufacturing employment, 51.4 per cent worked in the informal/small-scale sector, while only 48.6 per cent worked in the formal sector in the 1980s, a balance which must have shifted further towards the small-scale sector since. In 2010, Abid Burki and his colleagues estimated that the 'SMEs constitute 90 per cent of the economic establishments and contribute 30 per cent of GDP and 25 per cent of export earnings, and employ 78 per cent of the non-agricultural labour force'.[3] Tables 8.10 and 8.11 make other comparisons between the formal and small-scale sectors, from which it is clear that much of the capital stock and value-added took place in the large-scale formal manufacturing sector. The annual growth rates over the period 1976–84 (Table 8.12) reveal that in many important areas—employment generation, value-added and growth in capital stock—the small-scale sector has performed far better than the formal, large-scale, manufacturing sector. While the reasons for this growth are discussed below, these same reasons would very strongly suggest that, by most criteria, the small-scale informal sector has outperformed the formal sector in the last twenty years.

With regard to the growth rates in the small-scale sector, it is worth noting the arbitrariness reported by the government in its annual *Economic Survey*. For example, in the 1996/7 survey, the growth rate for the small-scale manufacturing sector for the period 1986/7 to 1996/7 is given as a fixed 8.4 per cent. In the 1999/2000 survey the growth rate is 8.4 per cent from 1990/1 to 1996/7, and then 5.31 from 1996/7 to 1999/2000. However, in the *Economic Survey* of 2002/3, the

growth rate from 1992/3 to 2002/3, is a fixed 5.3 per cent. As we have indicated in the previous chapter, the growth rate for the small-scale sector for 2000–12, seems to have been fixed at 7.5 per cent.

Further characteristics of the formal (large) and informal (small-scale and household) sectors can be seen from Tables 8.13 and 8.14. In the formal manufacturing sector in urban areas, the largest number of employed workers are in textiles, as they are in the small-scale and household sector. Fabricated metals account for a substantial share in the small-scale urban manufacturing sector and is ranked second, while food and tobacco are the next largest sector in the formal sector. Table 8.14 shows the distribution of employment within major industries by sectors. The formal sector dominates in the heavier, capital-intensive large-scale industry, while the informal sector dominates in wood and furniture products and jewellery (see Table 8.15). Moreover, the employment elasticity in the small-scale sector is amongst the highest in all the sectors, a fact which is of particular importance when the economy is not doing well and with poverty and unemployment growing (see Table 8.16). Unfortunately, fresh data does not exist which makes it difficult to examine more recent trends. The Final Report of the Panel of Economists estimates, that

> Pakistan's economy has a large presence of small and medium sized establishments, estimated at 3.3 million which contribute 30% of the GDP. . . . They are highly labour-intensive in comparison with the large-scale manufacturing sector with 95% employing less than 5 workers. Presently, there are several SME manufacturing clusters in the country. For example, there is a sanitary-ware cluster located in Gujranwala, a cotton ginning cluster in Rahim Yar Khan, an electrical fittings cluster in Sargodha, a cluster of industries manufacturing light engineering products

in Faisalabad, a wooden furniture cluster in Gujarat, a sports goods and surgical instruments cluster in Sialkot, and the auto parts, PVC pipes, and plastic products cluster in Lahore.[4]

8.2.2 Emergence and Growth

The early development and emergence of the small-scale manufacturing sector in Pakistan, especially in the Punjab, is summarized by Asad Sayeed as follows:

> The tradition of small-scale manufacturing in the Punjab goes back to the middle of the 19th century. But . . . governmental bias against the small-scale sector, low levels of absolute income, a stagnant agrarian economy through the 1950s, and lack of linkages from consumer goods-based import substitution provided little impetus to small-scale industry in the 1950s. The emergence of any significant growth in the sector can be traced back to the beginnings of mechanization in agriculture in the 1961–65 period and the subsequent giant leap experienced in the 1967–70 period with the introduction of green revolution technologies. A survey carried out in 1969 discovered specialized clusters of small-scale industry that had mushroomed in various large and small towns of the Punjab since the beginning of the 1960s. [Others] also report that in 1968 there were 20,000 power looms producing cotton cloth in the non-mill sector in the Punjab.[5]

Khalid Aftab and Eric Rahim, writing about the Punjab, say that there was a sudden emergence of the small-scale sector, 'as if out of nowhere', in the early 1960s. Daska, a small town in central Punjab, had at best a few machine shops in 1961, but by 1965 more than 120 shops were engaged in diesel production. The small-scale agriculturally related engineering industry producing small diesel engines and water pumps, which 'hardly existed' in 1960, employed a labour force of 6,000 by 1965. They argue that 'this aspect of the development assumes even greater importance when it is realized that regular manufacture of these products was unknown in this region of the subcontinent before the 1950s'.[6] They add that 'the emergence of a completely new small-scale sector without any direct government assistance, employing over 6,000 workers in a short period is not, to put it mildly, an everyday occurrence in less developed countries'[7] (see also Appendix 8.1).

Clearly, agricultural growth and the Green Revolution played a critical role in the development of the small-scale industrial, especially agricultural engineering, sector in the Punjab in the 1960s (see Chapters 3–5). In fact, the Green Revolution and its consequences transformed the entire agricultural, industrial, social, and economic structure in major ways (see Chapter 26). One consequence of these developments was the phenomenal growth in the small-scale sector in that period.

Ijaz Nabi analyses the impact of the Green Revolution on the industrial process as follows:

> Demand for farm machinery resulted from the impressive growth of Pakistan's agriculture after the introduction of new dwarf wheat and rice varieties and chemical fertilizers in the 1960s. The agricultural sector grew between 3% and 6% per year, reaching a peak in the late 1960s, and this growth generated considerable demand for agricultural machinery. The most important demand was for tube well engines and water pumps, which ensure timely supply of water and thus facilitate the use of chemical fertilizers. During this period of rising farm incomes, other farm activities such as ploughing and threshing also started to be mechanized. By the late 1970s farmers began to complain about shortages of labour at peak periods of sowing and harvesting. As a result, there was a rapid increase in the use of tractors and tractor-driven threshers, which enabled early harvesting of the winter crop (wheat) and timely sowing of the summer crops (cotton and rice), and which contributed

> to an overall increase in cropping intensity. Agronomists have called this phenomenon the Thresher Revolution, following the earlier Green Revolution. Demand was also created for haulage machinery such as trolleys for marketing the increased agricultural produce.[8]

For Asad Sayeed, the growth impetus for the small-scale sector in the 1970s occurred as a 'consequence of the convulsions suffered by the large scale sector'[9] under Bhutto. For him, the most important policy in this regard was the pro-labour legislation introduced in 1972. However, for the Asian Development Bank,

> possibly the single most important factor in the increase in the SSI [small-scale industrial] growth rate during the 1970s was the massive devaluation of 1972 and the Government's abandoning the multiple exchange rate as a part of the Export Bonus Scheme. Since the Government allowed LSM [large-scale manufacturing] a subsidy on the import capital and raw materials via artificially cheapened foreign exchange while SSI had to pay the free market rate for foreign exchange to import these items, it was difficult for SSI to compete with LSM in the production of consumer goods or engineering industry products. Devaluation changed this by reducing LSM's cost advantage vis-à-vis imported capital and raw materials. Further, the increase in the effective exchange rate for machinery and equipment was much greater than that for raw materials required for their local manufacture. Thus SSI's competitiveness vis-à-vis imports was also improved. Finally, since SSI goods (e.g. carpets, garments, surgical instruments, sporting goods, etc.) tend to be export-oriented and therefore face price-elastic external demand curves, these industries received a relatively larger boost from the devaluation than did the LSM industries which had become more oriented toward the protected domestic market.[10]

Asad Sayeed agrees with this analysis and argues that it helped the small-scale, export-related industries such as cloth, surgical instruments, and sports goods. He also identifies the impact of the Suzuki car and motorcycle assembly plants

on the small-scale engineering goods industry through backward linkages from subcontracting.[11]

The import liberalization that followed the 1970s and 1980s is identified as a positive development for the small-scale industrial sector compared with the 1960s, when this sector was faced with raw material constraints. Also, Bhutto's nationalization was addressed towards private, large-scale manufacturing investment, which declined later for fear of further reprisals, and it is possible that some of these investment funds were diverted towards the small-scale sectors. The Asian Development Bank study argues that 'this seems particularly likely in the textile industry where many looms were uprooted from large mills and set up as small independent production units by mill owners'.[12] Another boost to the small-scale sector following nationalization was that industrial capital from the large-scale manufacturing sector was diverted to trade and exports, possibly making it easier for the products of the small-scale sector to find domestic and foreign markets.

John Adams and Sabiha Iqbal have made a number of very important observations about the growth of the small-scale sector under Bhutto. They believe that there was actually a 'considerable bias' towards the small-scale sector, government credit to which increased by 122 per cent between 1972 and 1974, and was 'sharply higher' in 1976.[13] The devaluation of the Rupee also helped, and the new import policy of Bhutto allowed industrial plants costing less than Rs. 200,000 to be freely importable against cash.[14] Since

the small-scale sector did not fear nationalization, it attracted more private investment, and labour laws were also not strictly applied to that sector. John Adams and Sabiha Iqbal argue that the small-scale sector expanded during the Bhutto era, not because his government treated the sector in 'any exaggeratedly special fashion and it was more the absence of favouritism towards the big units that helped them'.[15]

Ali Cheema identifies yet another cause of the growth of the small-scale sector in the 1970s, which was the Cottage Industries Act of 1972.[16] The textile sector was the most affected by this, after which there was a major shift in textiles from the large-scale manufacturing sector to the small-scale and informal sector (see section 8.3).

A very pertinent point regarding the shift in the nature and composition of the small-scale sector is made by Asad Sayeed, who says that, due to the causes identified above, we see the 'emergence of the small-scale sector in the engineering and capital goods industry and textile sector also. *The important qualitative change that the above developments during the Bhutto interregnum brought about was to move small-scale manufacturing out of exclusively agrarian servicing activities to the terrain of broader manufacturing in the larger urban agglomerations.*'[17]

From the late 1970s and especially in the 1980s, Pakistan became a remittance economy, with large sums of money from the Gulf greasing the engines of industry and probably resulting in higher than average growth.[18] The large inflows of remittances and the increased purchasing power created a large demand for consumer goods, which was fulfilled by a small-scale sector eager to expand. This demand-led expansion had a multiplier effect as many of the locally produced goods had linkages with the capital goods industry, increasing demand and their production too. The construction boom of the 1980s, with increased demand for household items, was also an important catalyst, causing demand for local products to grow and having expansionary effects on the small-scale sector.

Since data regarding the actual size and trend rates related to the small-scale sector are particularly scarce, it is impossible to quantify its exact size. However, there is every indication that its growth rate is far higher than reported. It caters to a growing middle class and is being led by increased demand for goods consumed by this class. Hence, it would be interesting to know whether the sector is at all efficient compared to the formal large-scale sector, given the attitude of the government towards it in the past.

8.2.3 Issues Affecting the Small-Scale Sector

Khalid Nadvi, in his comprehensive study of the small-scale/informal sector, summarizes the main features of the sector as follows:

> The informal sector consisting of small enterprises and household units appears to be expanding more rapidly than the formal sector and already provides employment to the majority of those engaged in urban manufacturing in Pakistan. Informal sector units are characterized by extremely low levels of employment and a high incidence of unwaged family workers. As to capital intensity there appears to be a distinct technology hierarchy on the basis of which household units are the most labour intensive and formal sector concerns the most capital intensive. Furthermore, capital intensity is in real terms growing more rapidly in the formal sector leading to a net displacement of labour. As a result labour productivity is substantially greater in the formal sector while capital productivity is inversely related to unit size.[19]

He also argues that 'a focus on the informal small-scale units would appear to lead to the most socially efficient allocation of capital and thereby have the greatest potential for generating productive employment'.[20]

Large productivity differences exist between the two sectors, as can be seen in Table 8.17. The labour productivity (O/L) for the large-scale sector is expected to be higher due to the higher capital–labour ratio in the sector, a trend which, not surprisingly, can be seen amongst all industries in both periods in the table. An outcome that is taken for granted in much of the literature on the small-scale sector is that the small-scale sector is more efficient than the large-scale sector in the use of capital. However, the results provided by Asad Sayeed in Table 8.17 show that the ratio K/O presents a 'mixed picture', with some industries not subscribing to the norm. Nevertheless, the increase in the ratio K/O over time shows an 'increasing relative efficiency in capital use' for the small-scale sector. Moreover, a rising O/L ratio over time for the large-scale sector indicates increasing labour productivity in that sector. Asad Sayeed concludes his analysis by saying that 'the claim that higher labour intensity in the small-scale sector leads to its higher capital efficiency is not borne out by the data'.[21]

One opinion expressed, without exception, by all scholars working on the small-scale sector is that the state or government has until very recently treated the sector usually with indifference, but often with contempt. As the previous two chapters also reveal; almost without exception—the exception possibly being the Bhutto regime—state policy has been very heavily biased in favour of the large-scale manufacturing sector.

Khalid Aftab and Eric Rahim, who have examined the phenomenal growth of the small-scale agricultural-engineering sector in the Punjab, argue that 'government policy in Pakistan during the period under consideration [the 1960s] did not assign any important developmental role to small-scale enterprises. It was never thought that small-scale producers were capable of exhibiting any dynamism. Government policies explicitly aimed at large-scale industries and large-scale enterprises received special privileges.'[22] All favourable policies were directed towards the large-scale sector and in fact, according to the Asian Development Bank study, discriminated against the small-scale sector. Asad Sayeed argues that, after the bias of the state towards the large-scale sector in the 1960s, in the 1970s and 1980s 'the only change in government attitude seems to be the acknowledgement of the existence of the small-scale sector, though with no tangible policy thrust'.[23] While it is clear that the state played no real role in explicitly promoting the small-scale sector, an interesting observation made by a scholar on the sector is worth quoting here: 'the fact that this sector is exempt from or evades any form of tax and generally free rides on utilities such as electricity, gas, water, and sewerage, means that it enjoys an implicit "hands off" policy'.[24]

Table 8.17
Labour Productivity (O/L) and Capital–Output Ratio, Small-Scale and Large-Scale: 1983/4 and 1987/8, for Selected Industries (in Thousands of Rupees)

Industry sector	1983/4				1987/8			
	Small-scale		Large-scale		Small-scale		Large-scale	
	K/O	O/L	K/O	O/L	K/O	O/L	K/O	O/L
Food	0.31	85.78	0.22	399.51	0.31	64.65	0.28	454.53
Textiles	0.23	41.11	0.40	105.98	0.44	19.86	0.45	170.49
Footwear	0.08	21.60	0.16	100.87	0.09	24.23	0.18	441.20
Wood and cork	1.04	11.35	1.24	141.21	0.88	17.34	0.94	147.41
Furniture	0.28	15.27	0.29	85.67	0.32	18.97	0.78	125.82
Non-metallic minerals	0.10	86.53	0.65	303.30	0.23	51.98	0.80	387.72
Metal and metal working	0.33	19.98	0.27	113.38	0.30	28.40	0.28	173.60
Non-electrical machinery	0.97	15.86	0.24	209.50	0.57	29.88	0.35	210.17
Others	0.23	26.62	0.36	103.16	0.39	25.45	0.26	123.58
Total	0.23	49.33	0.36	265.90	0.39	29.86	0.41	280.50

Notes: The total is weighted by the three-digit share in value-added for respective sectors for the respective periods. The above numbers for the small-scale only include 'Small Manufacturing Establishments' to the exclusion of 'Household Units' which include 10 or fewer workers. A combined estimate of the two resulted in even lower labour productivity without affecting the capital–output ratio significantly.

Source: Sayeed, Asad, 'Political Alignments, the State and Industrial Policy in Pakistan: A Comparison of Performance in the 1960s and 1980s', unpublished PhD thesis, University of Cambridge, 1995, 40.

There is a clear consensus on the position that the state, given the formidable contribution and growth rates of the small-scale sector, must now explicitly address the issues confronted by it and actively promote the small-scale sector. Khalid Nadvi argues that 'if manufacturing is increasingly going to be dominated by small and informal units, a larger and more comprehensive policy framework for this sector, that goes further than employment generation issues, would be required'.[25] In the late 1990s and more recently, there has been a conscious attempt by government to promote small and medium enterprises by offering them loans and providing them some support.

One of the more interesting findings of the work on the small-scale sector has been its close links with the large-scale manufacturing sector. Khalid Aftab and Eric Rahim believe that one of the reasons for the success of the Punjab firms was the overall environment of economic expansion along with the small firms' proximity to large enterprises. For the individual small producer, 'the external economies generated by the large were as important as those it obtained through the evolution of vertical specialization within the small-scale sector'.[26] Asad Sayeed, examining the experience of the successful small-scale sector in Japan and Taiwan, argues that the

> large-scale capital goods sector can create the appropriate linkages for the embodiment of technical change in equipment, which can then enhance the productivity of the small sector accordingly. Secondly, because of economies of scale, the large-scale sector can contribute towards reducing the cost of intermediate and capital goods for the small scale. Thirdly, with large firms subcontracting to the small, productivity enhancement and technical upgradation is further encouraged through user–producer interactions, quality standards, specification requirements, etc.[27]

This link with the large-scale sector can at times be critical, since the experience of countries where the small-scale sector has flourished shows that 'ultimately the fortunes of the small are intimately linked with those of the large'.[28] Hence, any strategy to improve the small-scale sector will also need to address the issue of developing an efficient large-scale intermediate and capital goods industry. Areas where linkages between the small- and large-scale manufacturing sectors already exist will need to be further strengthened so that both benefit.

The single most important constraint faced by the small-scale sector has been the availability of credit—see Boxes 8.1 and 8.2. All surveys consistently come up with this finding. Khalid Nadvi, in his survey of 328 small-scale enterprises, found that only two of them had been able to obtain credit from the formal banking sector and both the loans were of very small amounts. The constraints to borrowing from the formal sector were many:

> Formal credit from the banking sector had been obtained by only two of the sample of 328 enterprises, both cotton weaving units in Gujranwala. In both cases the volume of credit availed was low (Rs. 7,000 and Rs. 10,000) and used towards purchases of plant and equipment.

Box 8.1

Finances for the Small-Scale Sector

Abid Burki and his colleagues at LUMS, in their extensive study on industrialisation in Pakistan, examined the constraints and issues of financing the small-scale sector.

The financial market in Pakistan is shallow as firms rely on retained earnings to finance their working capital and investment needs. Trade credit and banks plays a smaller role in working capital financing; Pakistan's firms rely more on internal funds. The pattern of funding using retained earnings is robust; ranging from 88% in NWFP to 78% in Sindh.

Credit rationing in the formal credit market is a major constraint faced primarily by small- and medium-sized firms that constitute a significant portion of the industry. A study conducted by the Lahore University of Management Sciences (LUMS) in 2006 also highlighted that access to finance is the most critical impediment to the growth of the SME sector. A survey found that 57% of new investment by SMEs and 67% of their working capital comes from retained earnings, whereas according to studies conducted by international organizations, banks provide only 7–8% of the total funding requirement of SMEs. This is due to constraints on both the demand and supply side. On the supply side these are: weak and poorly enforced creditor rights, high unit costs of SME lending, and the reputation of SMEs as riskier borrowers in the financial system. On the demand side the constraints consist of loan disbursement procedures, high interest rates and collateral requirements that raise the cost of access to credi. As a result of these financial constraints it is difficult for micro enterprises and SMEs to grow in size and scale. The resultant diseconomies of scale and inaccessibility to efficient technology of production are the main factors behind their low productivity, which inhibits their growth potential.

Information asymmetries and the fear of adverse selection are factors that restrict commercial bank lending to SMEs. This is because the information that SMEs can provide to banks in the form of financial accounts, business plans, feasibility studies, etc. often lack detail and rigour. This problem is aggravated by the low level of education of small entrepreneurs. In a sample survey, 35 per cent were either illiterate or educated to below the matriculation level and unable to adequately articulate their case.

In order to mitigate the problem of asymmetric information and adverse selection, banks have adopted precautionary measures such as requiring that financing be collateralized, with collateral often exceeding 100 per cent of the loan. In the sample, the average value of the collateral was higher, the smaller the business. This, however, leads to other issues as SMEs generally do not have many assets that can be collateralized; for example, over 40 per cent of the SMEs in the sample admitted to not receiving a bank loan because they lacked the necessary collateral.

Moreover, most commercial banks regard SMEs as riskier than large firms due to many reasons. Firstly, SMEs face a more uncertain competitive environment compared to larger companies; they experience more variable rates of return and higher rates of failure. Secondly, SMEs are less equipped in terms of both human and capital resources to withstand economic adversities, particularly unanticipated economic shocks. Thirdly, their inadequate accounting systems and lack of financial controls undermine the accessibility and reliability of information on profitability and repayment capacity. Finally, SMEs in Pakistan operate in a somewhat ambiguous environment regarding governance, which reduces the security of transactions. Thus there is a greater risk that banks will not get paid, or that assets such as property will not be properly registered.

In view of all these difficulties, banks frequently refuse to lend at all or severely restrict the size of their loans to SMEs. It is, therefore, not surprising that 86 per cent of the SMEs surveyed had not acquired a bank loan. Moreover, in the total private sector credit disbursement of PKR1,669.740 billion in FY2007, the share of the SME sector was a shocking 1.7%.

Burki, Abid et al. *Industrial Policy, Its Spatial Aspects and Cluster Development in Pakistan: Volume 1 Analysis Policy Report 2010*, Lahore University of Management Sciences, Lahore, 18 October 2010, 135–7.

> All units were unregistered which technically restricted them from qualifying for credit from the formal banking sector. In addition, collateral, guarantees, lengthy procedures and detailed paperwork (usually in English) necessary to obtain formal bank loans were major barriers to those operating unregulated units. Even if collateral was available, a large number of informal enterprise owners were either illiterate or had extremely low levels of formal education and were consciously alienated from the formal procedures required by commercial banks.
>
> Alongside the daunting procedures, respondents stated that the banking bureaucracy was actively unhelpful and discouraging to small-scale informal units. Many respondents felt that the level of bribes, which they alleged had to be paid to bank officials in order to access formal bank loans, were prohibitively high for unregulated small-scale units.[29]

The small-scale and informal sectors therefore have to find credit for working and fixed capital from other sources. The sources vary according to type of industry; in some, the most important source of credit is through the linkages which exist in that sector with wholesalers, large intermediaries, or capitalists. For example, most of the loans in the carpet weaving, transport and fishing sectors are made in the form of advances with very high rates of interest, and the borrowers are almost bonded to the person making the loan. In other sectors, the nature of borrowing is less exploitative and relatives and friends, as well as family savings, provide

Box 8.2
Credit Availability to the Small-Scale Sector

Asad Sayeed discusses the problem of the availability of credit to the small-scale sector:

Proponents of the level playing field argue that once interest rates truly reflect the scarcity value of capital, it will remove the implicit bias against the small-scale producer. Given the prevalence of borrowing from the curb market in the small-scale sector, market-determined interest rates would increase the cost of capital for the large-scale sector and lower them for the latter. However, the moral hazard of lending to a large and diverse number of borrowers still remains. As Anderson argues, in a situation where interest rates are market determined and the small-scale sector is the recipient of credit, interest rates will rise to the level of the curb market, increasing the risk of default in the formal financial sector. Moreover, because the interest rate is above the actual opportunity cost of capital (because it has to cover the losses incurred by those who have defaulted), entrepreneurs in both the large- and small-scale sectors, facing interest rates above the opportunity cost of capital will be loath to borrow. Not only will there be a disequilibrium created from the demand side, but as Stiglitz and Weiss show, this will lead to adverse selection on the part of borrowers. Once the lenders decide on a more discriminatory lending policy, typically the axe will fall on the small-scale borrower. Therefore, according to Anderson:

The practical effect, therefore, of simply removing administrative controls would be for institutions not to lend rather than charge high interest rates, on the one hand, or face significant short run losses in the uncertain expectation of long-run profits on the other. The above-mentioned externality then takes the form of potentially low risk projects and efficient investments in small-scale industry being entirely excluded from access to institutional finance.

The question to ask is that given the above identified market failures in the credit market, how did the countries which have efficient and growing small-scale industrial sectors overcome the problem of moral hazard? Particularly in the case of Taiwan, real interest rates—though state controlled—were high, yet significantly lower than the curb market rates. Amsden reports that small-scale firms in Taiwan were also discriminated by the state-controlled financial sector, with the share of large firm borrowing being three times more than that of the small and even medium sized firms. The same study cites that start-up capital for small firms in Taiwan is either raised through family savings, the curb market or in many cases from windfall gains made through urban real estate. So far as working capital and at times equipment is concerned, 'big business appears to be an important source of finance for small business'. Other differences between the success stories and the failures is that small-scale is provided with adequate infrastructure, which lowers their overall cost structure, thereby increasing their profitability to the extent that they can afford to borrow from the usurious curb markets.

loans for the sector. The committee system—or *bisee*—is also an important source of funds for enterprise.

Some recommendations have been made by various scholars on how to deal with this credit constraint. There is the mainstream neoclassical argument of working through the market and providing a 'level playing field', by removing the subsidy on the interest rate on capital, and by providing a 'credit package' (see also Boxes 8.1 and 8.2). However, as the Asian Development Bank study argues, 'it must be kept in mind that SSI [small-scale industry] comprises several hundred thousand units and any attempt to provide incentives directly to individual enterprises through bureaucratic channels would be futile'.[30]

There is no denying the fact that the small-scale sector plays, and is going to play, an increasingly important role in Pakistan's economy. Rashid Amjad, for example, argued that as much as 25 per cent of Pakistan's total export earnings were generated from the small-scale industrial sector a figure, which we show, has increased.[31] Ironically, in many ways, the dynamic growth of this sector has taken place because the state has kept away from it and let it function largely on its own. Government interference or even 'help' may actually prove to cause a slowing down of this impressive growth. The recommendations from the Panel of Economists for this sector—Appendix 8.2—which focus a great deal on what the government ought to do and the bureaucratization of the small-scale sector, may actually end up with too much control of the sector undermining its dynamism.

8.3 The Textile Industry and its Crisis

When we think of the manufacturing industry in Pakistan, it is the textile industry that immediately comes to mind, and for good reason too. The textile sector holds a very important position in Pakistan's economy in terms of employment and value-added, but especially in the contribution the industry makes to exports. It has the highest manufacturing value-added for any industry in the manufacturing sector, contributing 26 per cent, with the food sector next in line, contributing 18 per cent in 2005/06. Similarly, about one-third of the entire manufactured employment was in the textile sector, with food a distant second, having only 13 per cent. In terms of exports, approximately 30 per cent of Pakistan's total exports came from cotton textiles in 1990/1, up from 20 per cent in 1982/3.[32] Cotton yarn's contribution to exports increased from 10 to 18 per cent between 1982 and 1990. These figures are only for cotton textiles, and if we

included synthetics they would be even higher. According to UNIDO, textiles constituted 56 per cent of Pakistan's exports in 1985.[33] Tables 8.18 and 8.19 give an overview of the cotton textile industry. In 2010 Abid Burki and his colleagues wrote that, 'Pakistan's economy was built around textiles and its current base is still concentrated in textiles. Cotton textile production is the most important of Pakistan's industries, accounting for about 19 per cent of large scale industrial employment and about 60 per cent of total exports',[34] but for which world demand is falling.

Pakistan's textile industry has lost its relatively more prominent position of the 1960s and 1970s, and today holds a little less than 2 per cent of the world market. Pakistan enjoyed a very dynamic performance in the 1960s, and was among the leading underdeveloped countries that were emerging in the world cotton textile market. In fact, Pakistan's record was quite envious, as between 1962 and 1970 it cornered over 11 per cent of the world market. By 1972 Pakistan held about 3.5 per cent of the world market in textiles, which fell to 1.5 per cent in just four years. It rose again to 2.5 per cent in 1983 and has since stabilized at somewhat less than 2 per cent.[35]

More interestingly, the share of Hong Kong and South Korea as a proportion of the world market tells a revealing story. In 1972 Hong Kong held less than Pakistan's share, with under 3.5 per cent of world output, while Korea's output constituted a mere 1.5 per cent. In 1988 Hong Kong held a little under 9 per cent, while Korea's share of the world market had risen to 6.5 per cent.[36] Some of the reasons for the relative fall in Pakistan's performance, and the rise in South Korea's and Hong Kong's contribution to world output, are discussed below.

Many fortunes were made in the 1960s by leading Pakistani industrialists, almost all of whom had significant interests in the textile sector. In 1959 the nine largest industrial houses accounted for 50 per cent of total production, with the five biggest contributing as much as 37.3 per cent. The Saigol group alone controlled 15 per cent of the total production of cotton textiles in Pakistan (West Pakistan). Of the thirteen largest industrial houses in (West) Pakistan, cotton textiles accounted for as much as 71 per cent of total production; engineering came second with only 7.9 per cent. By 1970 the top four industrial houses controlled almost 28 per cent

of cotton textiles, being produced by a mere twenty-three industrial houses.[37] What is clear from the above is that the cotton textile industry was highly concentrated amongst a few houses and that it was located almost totally in the large-scale textile manufacturing sector.

Table 8.18 presents a rather unflattering picture of Pakistan's prime industrial sector, cotton textiles. Although the number of installed spindles has been growing steadily, and shows a substantial increase, the percentage of spindles actually working has been lower than during the 1950s and 1960s.

In 2010 or so, while 95 per cent of installed spindles were working, one suspects that by 2011 and 2012 when the electricity crisis was at its peak, the actual number of working spindles would probably have fallen. For both these years, there were ample newspaper reports about the collapse of the textile industry, and industry overall, due to power shortages. In the looms sector, the position has been far worse, with only 66 per cent of installed capacity being utilized, and again here, one has seen complete or partial closure since 2010. Moreover, the number of installed looms has been cut by almost half and the number of working looms is currently less than one-fifth of that in the 1950s and 1960s. The main industry of Pakistan does not seem to be doing well at all, a fact confirmed by Table 8.19. While yarn production may have increased fifteen-fold since 1955, cloth production, having touched a peak in the early 1970s, fell to well below 1960 rates. A study on the textile sector in Pakistan gave the breakdown between small- and large-scale sectors as follows:

> The industry consists of large-scale organized sector and a highly fragmented cottage/small-scale sector. The various sectors that are a part of the textile value chain are: Spinning, most of the spinning industry operates in an organized manner with in-house weaving, dyeing, and finishing facilities. Weaving comprises of small and medium sized entities. The processing sector, comprising dyeing, printing, and finishing subsectors, only a part of this sector is operating in an organized state, able to process large quantities while the rest of the units operate as small and medium sized units. The printing segment dominates the overall processing industry followed by textile dyeing and fabric bleaching. The garments manufacturing segment generates the highest employment within the textile value chain. Over 75% of the units comprise small sized units. The knitwear industry mostly consists of factories operating as integrated units (knitting + processing + making up facilities). The clothing sectors both woven and knits are mainly clustering [sic.] in Karachi, Lahore and Faisalabad where sufficient ladies [sic.] labour is available.[38]

As Table 8.20, and sections 8.1 and 8.2 show, much of manufacturing in general, and of textile manufacturing in particular, now takes place in the small-scale manufacturing sector. The dramatic shift that took place in the nature of manufacturing industry in Pakistan, for the reasons explained in section 8.2, also affected the textile industry in a major way. For example, cotton cloth production, which was 625.3 million square metres in 1970/1, fell to 123.5 million square metres by 1988/9 largely on account of this shift from the large-scale to the small-scale sector.[39] The cottage and small-scale segment of the textile industry employs more than double the number of workers in the large-scale textile sector (see Table 8.20). According to a study by the Institute of Developing Economies, the negative productivity in the textile and garment sector is mainly the result of fragmentation of the industry, shifting from large-scale to smaller-scale units.[40]

Table 8.20
Overview of the Cotton Textile Industry: 1988

	Number of units	Equipment	Direct employment (estimates)
Large-scale mill sector			
1 Spinning	186	4.72 million spindles including rotors	150,000
2 Composite mills	44	16,000 looms	. .
3 Finishing	10	. .	1,000
4 Garments	50	3,000 sewing machines	5,000
Total			156,000
Small-scale cottage sector			
1 Power looms	15–20,000	100,000 looms	150,000
2 Finishing	150	. .	6,000
3 Towels	160	2,500 looms	4,000
4 Garments	2,500	80,000 sewing machines	150,000
5 Hosiery	550	10,000 knitting machines	20,000
Total			330,000

Ali Cheema states that

> under the Bhutto government the textile sector lost the importance it held in the state policy regime in the '60s. This is because the emphasis of the state shifted towards the creation of public sector intermediate and capital goods industry and was no longer on the promotion of growth through manufacturing exports.[41]

Moreover, the Cottage Industries Act created a bias against large-scale production and according to Cheema, 'this act changed the structure of the industry in the textile sector', resulting in the fragmentation of firm size. Both output and employment in the small-scale sector grew significantly after the Act, with the number of power looms increasing from 20,000 in 1968 to 32,000 in 1972 and to 53,000 in 1978.[42] Moreover, the nationalization programme of the Bhutto government broke the hold of the large-scale manufacturing sector generally, but most importantly, the power of this group was significantly depleted as the critical link between the financial and industrial sectors was ruptured. John Adams and Sabiha Iqbal concur with this view, arguing that the policies that Bhutto's Finance Minister 'put into place were the single most important cause of the poor performance of the textile industry,'[43] since the nationalization of major industries, banks, and insurance companies, and the new labour laws enacted, were all against the interest of large industry, where the textile sector was located.

Table 8.21 shows how Pakistan's textile industry performed compared to Hong Kong's and South Korea's between 1973 and 1987, and explains the reasons why Pakistan's share of the world market in textiles fell during this period and why those of Hong Kong and Korea increased. Asad Sayeed argues that

> both Hong Kong and Korea captured greater market shares as a result of a much larger component of their growth in exports coming from the competitive effect. This means that these countries were able to break into world markets on the basis of more dynamic production and marketing performance rather than merely relying on growth in the world market or product specialization at a given time.[44]

Table 8.21
Constant Market Share Analysis: Pakistan, South Korea, and Hong Kong: 1973–87

Country	World trade effect	Commodity composition effect	Competitiveness residual
Pakistan	82.1	41.9	–24.1
Hong Kong	41.1	9.5	49.4
South Korea	24.6	5.9	69.5

Sources: Compiled from: Cheema, Ali, 'Pakistan's Textile Policy and Trade Performance, 1972–90,' mimeo (Cambridge: Sussex College, 1995), and Sayeed, Asad, 'Political Alignments, the State and Industrial Policy in Pakistan: A Comparison of Performance in the 1960s and 1980s', unpublished PhD thesis, University of Cambridge, 1995, 115.

Further reasons given by Ali Cheema for this fall in world output share relate to the fact that both Hong Kong and Korea shifted into higher value-added subsectors like man-made cloth and bleached cotton cloth. He writes that 'Pakistani entrepreneurs on the other hand ignored upgradation into either downstream higher value-added processes and/or into higher value-added products within each subsector.'[45] Essentially *Pakistan failed to diversify* into other products and lines at a critical juncture when the world textile industry was undergoing change. This conclusion is reinforced by the fact that despite the imposition of import quotas by the advanced capitalist countries, Pakistan was even unable to meet the quotas. Moreover, both Hong Kong and Korea faced a stricter quota regime than that applicable to Pakistan. While both these East Asian countries were able to beat the quota constraint by diversifying and upgrading into higher value-added and quality products, Pakistan was not able to meet this challenge, and hence suffered.

Asad Sayeed argues that the 'loss in world market shares points to underlying inefficiencies in the textile sector, in spite of relatively high productivity growth in the sector',[46] and this is despite the fact, as pointed out by the World Bank, that 'the textile industry in Pakistan is the *most efficient industry within the manufacturing sector*'[47] (see Box 8.3). For UNIDO, the factors that will have to be addressed in order to increase the textile performance include problems presently related to 'a narrow production base, outdated technology, limited product range, [and] increase in quality consciousness in importing countries'.[48] (Appendix 8.2 in the first edition of *Issues*, tries to identify some political and institutional factors that have resulted in the deterioration of the textile industry in recent years).

Zubair Bandukda highlights many of the pressing issues which affect Pakistan's most important industry, that of textiles. He argues, that while Pakistan is the world's fourth largest cotton producer with an annual production of now around 12–14 million bales and its cotton fibre is considered one of the best in the world, due to poor picking, ginning, and elimination of contamination, it loses this advantage. Pakistan is also ranked fourth in terms of spindles and twelfth in terms of rotors installed, and is the world's fourth largest cotton yarn producer as well, after China, India, and the USA.[49]

About 70 per cent of Pakistan's yarn production is coarse cotton yarn and only 3 per cent accounts for fine and super fine counts. Pakistan is one of the largest exporters of cotton yarn in the world, in terms of quantity, but in terms of value it captures only 5 per cent of the export market. This shows the low value-added nature of Pakistan's exports of yarn.

In terms of weaving as well, Pakistan is the world's fourth largest exporter of woven cloth, although much of the woven fabric is of low value, which is attributed to the low level of technology both in the weaving and processing sector, with processing the weakest link in the entire textile value chain. In the world's largest market of cotton fabrics,

Box 8.3

Efficiency in the Textile Sector

The World Bank in its evaluation of the textile sector has argued somewhat surprisingly as follows:

The textile industry in Pakistan is the most efficient industry (DRC = 0.92) [DRC: domestic resource cost] within the manufacturing sector. Efficiency is, however, far from uniform, with DRC estimates at the product group level varying from 0.72 for cotton spinners to 2.20 for woollen products. In general, the industry is more efficient in the spinning of locally sourced fibre (cotton) and the use of the same in made-up items (towels, canvas, knitwear, and garments). It is relatively less efficient in the conversion of spun short staple and filament yarn into cloth (both finished and grey) and is least efficient in the conversion of imported fibre (wool) into both yarn and cloth. Internationally, the textile industry is characterized by large-scale integrated operations employing very sophisticated technology to produce an increasingly more demanding product. Both the weaving and finishing industry and the woollen industry in Pakistan are characterized by small-scale, non-integrated units employing very simple, relatively labour intensive technology to produce a product of questionable quality.

The industry as a whole operates within a largely neutral assistance regime (EPR=13%) [EPR: effective protection rate], earning average private financial returns of 17 per cent which are approximately equal to the estimated public economic return of 18 per cent. This picture is, however, highly misleading. Some 25 per cent of domestic resources are employed in industries which are very efficient and are negatively protected. These industries are all characterized by the use of man-made fibre (MMF) and are unable to pass-on an average 24 per cent distortion in input prices to their consumers because of competition from a close substitute—pure cotton textiles—which is generally priced domestically at or near the world price. Such a situation is hardly conducive to the growth of the MMF section of the industry which is necessary if Pakistan is to develop a more balanced profile relative to international demand trends.

The increased availability of imported fabric and garments after implementing the trade reform would induce a restructuring of parts of the textile industry. Such a restructuring will help Pakistan's textile sector to make better use of its competitive advantage in world markets. The trade reform would eliminate the bias against the use of man-made fibre. Cotton spinning (including mixed-fibre) would become more profitable despite the elimination of the export tax on raw cotton. In all other areas of the industry profits will suffer, unless the efficiency of production is increased, in particular the weaving and finishing and woollen yarn industries which are currently operating under high protection with low levels of efficiency.

Source: World Bank, *Pakistan: Country Economic Memorandum FY93: Progress Under the Adjustment Programme*, Report No.11590-Pak (Washington DC: World Bank, 1993), 48–9.

Pakistan's finished cloth share is extremely small, only 3 per cent of global trade. It is important to emphasize that while Pakistan's main exports are textiles and garments, they occupy a dominant position in the low cost and low quality cotton fabrics market.

The reason for this is that apart from a small number, the majority of processing units in Pakistan are not integrated but independent commercial dyeing, printing, and finishing units. Most of these units have low dyeing technology catering to the processing requirements of the low-end knitting and woven fabric manufacturers. Textile made-ups (towels and bed-sheets) as well as the garment industry's demand are also met by such units.

Textile processing is a technology-oriented business which requires capital-intensive technology, but most of Pakistan's machinery in this sector is more than fifteen years old and requires a major overhaul to upgrade it to quality and modern standards. The tendency is to invest in the printing side of the industry even though the dyed fabric is a higher value product compared to printed fabric and fetches a higher price. This trend is driven by the dominance of the power loom sector for the supply of woven fabrics. There is a need to invest in the dyeing side of the industry rather than printing which will result in the unit price of the fabric being exported.

In the textile sector, the biggest growth is taking place in the share of clothing and apparel. Clothing trade since the 1990s has grown at a rate of 82 per cent compared to textiles, 4 per cent, with both accounting for around $160 billion worldwide. Pakistan has at best 1 per cent of the global apparel market, primarily because Pakistan exports have a low share of value-added goods, which continues to increase. This means that while Pakistan has a higher share in the low value-added segment of the market, its export earnings will remain low unless the textile industry diversifies and moves into the high value-added, quality garments and made-ups sector.

In light of globalization and WTO agreements, Pakistan's textile sector has entered a completely different realm of competition and issues—see Chapter 9 Section 9.5. Musleh-ud-Din and Kalbe Abbas[50] have examined the impact of these changes and in light of these new conditions have made some recommendations which are worth considering. They argue that in the past although the textile and clothing industry has been protected under high tariffs, with subsidies, concessionary finances, subsidized cotton prices, and numerous other incentives and breaks, it has not been able to achieve high efficiency, and as we show above, has not made an entry into the high end of the quality market.

In order to take advantages of these changes, Pakistan will have to improve its quality standards across the board, from raw cotton to finished products. More research and development is required in types of cotton especially the superior long staple varieties of cotton. Musleh-ud-Din and Kalbe Abbas also recommend that Pakistan move into

synthetic fibres as this sector has been growing in recent years. Most importantly, Pakistan will have to move into higher value-addition products rather than depending on low-end or intermediate products. This would require a strong and modern weaving and processing base. Moreover, the problems which have affected Pakistan's overall industry since 2010, such as electricity and gas shortages, will also have an impact on Pakistan's textile sector. In addition, a global recession also bodes ill for Pakistan's main exports. While the value of textile exports from Pakistan may have grown in 2011, this was largely a price effect, due to the international rise in cotton prices, not so much a quantity effect. Hence, when cotton prices fell, as they did in 2012, both the volume and value of Pakistan's main exports also fell, and will continue to do so, unless some of the structural (internal to the textile sector) changes as discussed are implemented. See Appendix 9.3, in Chapter 9, on the repercussions of the post-quota regime and Pakistan's textiles sector.

8.4 Has Public Sector Industry Been a Failure?

The public sector and the role of the government in general have been much maligned and discredited in recent years. There has been a wave of denationalization and privatization of state-owned enterprises not only in underdeveloped countries, but in advanced capitalist states such as the UK as well. Not only have publicly owned and managed industrial and non-industrial units been handed over to the private sector, but with the process of liberalization, deregulation, and so called market-friendly policies adopted by underdeveloped countries, usually in the guise of a Structural Adjustment Programme, the role of the state in the provision of basic social and infrastructural facilities has also diminished markedly. Today, the conventional wisdom is that, as far as intervention by the government is concerned, 'less is better'. So, in many ways, the existence of public sector industries is itself in question, and with the increased pace of privatization taking place in most countries, including Pakistan, one wonders if in a few years any state-owned enterprises will exist at all. One of the reasons why the privatization process is proceeding at such a pace is that there is a strong belief that public sector enterprises are inefficient, costly to run, poor performers and a major drain on the exchequer. The argument goes that the state should no longer subsidize loss-making enterprises and they should be either sold to the private sector to run and manage, or closed down altogether. This section will evaluate the role, conditions and performance of public sector enterprises in Pakistan.

Figure 8.1 gives a chronology of the main developments with respect to public sector enterprises in Pakistan. The main expansion of public enterprises took place under the government of Zulfikar Ali Butto following his nationalization programme of 1972. The role of public sector industry in the 1950s and 1960s was mainly to supplement and assist the private sector, which was considered to be the leading vehicle of industrial development. The 1972 nationalization process reversed that trend, with the public sector taking the lead.

Prior to 1972 the main public sector industries were managed by the Pakistan Industrial Development Corporation (PIDC), which was created in 1952 with the aim of accelerating the rate of industrial development in the country. PIDC was 'to invest in fields in which private investment would be weak due either to technological complexity or the lack of immediate profit potential. It was also to transfer its projects to private entrepreneurs once they became profitable in order to promote and strengthen the private sector.'[51] It was also expected to promote some sense of regional balance between East and West Pakistan, developing industries in backward areas.

PIDC played a very important and effective role in fulfilling its mandate and initiated numerous projects in the jute, fertilizer, heavy engineering, and cement industries, some of which were later sold to the private sector. More importantly, however, it acted as an important 'catalyst in the subsequent development of these industries'[52] by training labour and creating important linkages with other sectors. In many ways, the role of PIDC was one of a pioneer, leading the way for the private sector in later years.

In the period 1972–7 the role of the public sector was considerably expanded, and by 1977 the government was 'heavily involved in finance and insurance, manufacture, transportation and communication, and energy. It had also entered the construction, trade and commerce, mining, and agricultural sectors.'[53] The Zia ul-Haq regime did not increase the role of the government by establishing new public enterprises, and much of the public sector investment during the early years of the Zia period went into ongoing projects. Although very little was privatized under the Zia government, the role of the public sector began to diminish as the private sector was unabashedly chosen as the leading vehicle to bring about economic and industrial development. After 1991 the contribution of public sector enterprises was further minimized with the launch of the privatization programme (see Table 8.22 for the share of the public sector in various activities).

Given the abhorrence of the regimes after Zulfikar Ali Bhutto towards the public sector enterprises and the desire to get rid of these units by the different governments since 1991, one might have the impression that the state was burdened by these loss-making, inefficient units and wanted to rid itself of them as soon as possible and at any price. Interestingly, however, the evaluations undertaken of the public sector at different times since 1977 paint a very different picture.

It must be remembered that public sector enterprises have, not merely to respond to pure market criteria, but also have social and political responsibilities and motives. Hence the 'inclusion of socio-political goals in the objective function of the existence and operations of public industrial enterprises can pull down productivity and profitability of these units'.[54] This means that the overall evaluation in financial or economic terms, as reported, will be less than the actual contribution and outcome of the public sector enterprises. Nevertheless, despite this proviso, their contribution has been very impressive.

Table 8.23 shows the important indices of the public sector industries compared to the overall manufacturing

Figure 8.1 A Chronology of Key Developments in the Public Enterprise Sector

Event	Date
Establishment of the Karachi Port Trust as the first public enterprise in what is now Pakistan	1886
Establishment of the Karachi Electric Supply Corporation (it became a public enterprise in 1952)	1913
Establishment of the Pakistan Refugees Rehabilitation Finance Corporation as one of the first public enterprises in independent Pakistan	1948
Establishment of the National Bank of Pakistan as the first public enterprise in the finance sector	1949
Establishment of Pakistan International Airline Corporation as a public enterprise and government monopoly in the air transport sector	1955
Establishment of the Pakistan Industrial Credit and Investment Corporation as the first development finance institution	1957
Establishment of the Water and Power Development Authority as a public enterprise and the major electrical power producer, transmitter, and distributor	1958
Establishment of four development finance institutions to assist in the economic development of the country:	
Industrial Development Bank of Pakistan	1961
Agricultural Development Bank of Pakistan	1961
National Investment (Unit) Trust	1962
Investment Corporation of Pakistan	1966
Establishment of the Oil and Gas Development Corporation as a public enterprise in the fossil fuels energy sector	1961
Establishment of the National Shipping Corporation as a public enterprise in the sea transport sector	1963
Establishment of the Pakistan Steel Mills Corporation as a public enterprise in the heavy industries sector	1968
Nationalization of 31 large firms in 10 'basic' industries. The private firms became public enterprises.	1972
Nationalization of the vegetable oil industry. The private firms became public enterprises.	1973
Nationalization of private, domestically-owned banks and insurance companies. The private firms became public enterprises.	1974
Nationalization of 2,000 rice, flour, and cotton ginning mills. The private firms became public enterprises.	1974
Denationalization of 2,000 rice, flour, and cotton ginning mills	1977
Efforts initiated in the Ministry of Production through its Experts Advisory Cell to improve the performance of 56 of its public enterprises	1981
Establishment of the National Disinvestment Authority	1985
Junejo government agrees to permit the private sector to establish banks.	1986
Junejo government permits private sector firms to bid on construction contract for electrical power station.	1986
Benazir Bhutto pledges no more nationalization of industry in the election campaign of 1988.	1988

sector in the period 1972–82. There is little doubt that the public sector industries performed far better than the overall manufacturing sector, *even under the Bhutto government* (1972–7) when the nationalization and pro-public sector policies were severely criticized and considered to be a failure. By no stretch of the imagination, based on Table 8.21, can one reach that conclusion. While public sector industries did fairly well under the Bhutto government, they performed *even better* under the more open and liberal economic regime of Zia. There was a significant increase in profits and productivity by the state-owned enterprises in the early Zia period, possibly due to a pro-investment and growth-friendly, overall economic and political environment, encouraging economic growth. Moreover, under the Zia regime a number of new units, initiated earlier, came into production. Asad Sayeed shows that the *weighted average of productivity growth in the public sector was higher than that of the private sector* once the numbers for the Steel Mill are removed from the sample. This, he argues is a 'surprising result', where apart from Pakistan Steel, 'the two sectors were equally (in)efficient'.[55] Sayeed's analysis clearly questions the biases perpetrated by the World Bank, which has played a central role in discrediting the contribution by the public sector. With reference to the late 1980s, a World Bank study argues that 'the private sector was confronted with pervasive regulatory controls in manufacturing and *burdened by large public enterprises suffering from poor performance and inefficiency*',[56] which clearly seems to be untrue.

A more detailed analysis has been conducted by Nawab Haider Naqvi and A. R. Kemal, who have extensively analysed the performance of public sector enterprises. The salient conclusions from this analysis are as follows:

1. Of the eight corporations which run the public enterprises, five of them, accounting for 71 per cent of output originating in public enterprises, have been *'reasonably profitable* even from a strictly commercial view'.[57]

2. It is presumed that the effective rates of protection are usually higher for the public sector than for private enterprises, but their results show that these rates are relatively *lower* in industries where public enterprises dominate.
3. The industries dominated by the public sector do not suffer from a higher level of inefficiency than that observed in the private sector, hence *'efficiency levels across industries are independent of the locus of ownership'*.[58]
4. *'The incidence of the worst kinds of allocative inefficiency is in the private sector rather than in the public sector.'*[59]
5. Of the sixty inefficient industries identified, only 9 were in the public sector.
6. Capacity utilization is high in public enterprises, where thirty-nine of the sixty enterprises had capacity utilization rates exceeding 75 per cent.

The overall conclusions of Nawab Haider Naqvi and A. R. Kemal regarding the public sector are forcefully articulated as follows:

> The public sector's profitability is due not to the higher level of protection that it enjoys (indeed, the effective protection rates are lower for them) nor due to any restrictions placed on the entry of new firms, but to its better performance and superior productive efficiency; and the charge of the *inherent* inefficiency of the public industrial enterprises is based neither on good theory nor solid empirical evidence.
>
> The basic message that comes out clearly . . . *is that changing the locus of ownership of industries is by itself neither a necessary nor a sufficient condition for an efficient operation of specific industrial enterprises.* Indeed, . . . both the private and public

> sector firms have operated efficiently as well as inefficiently, depending on the type of industry to which they belong. These results suggest very strongly that, in Pakistan, *there is nothing inherently good or bad about the public sector; or even about the private sector for that matter*.[60]

Finally, for them, 'where industrial inefficiency is the problem, steps should be taken to improve the situation regardless of the locus of ownership. The divestiture of public enterprises, mainly on ideological grounds or to secure dubious gains, or to satisfy the sensibilities of donors and creditors, is certainly not an optimal policy.'[61] These arguments, based on an extensive evaluation of public sector enterprises, were made in the 1990s, and following a thorough analytical account, make very strong arguments which went against the then emerging conventional wisdom. In the early 1990s when the IMF and World Bank sponsored Structural Adjustment Programmes were underway, there were groups and interests who were actively trying to malign the public sector. Since the 1990s, much has changed in the world, in Pakistan and in public policy as well. The movement to undermine the state and government intervention, has won many victories against those who would argue in defence of state-owned enterprises. The ideological map of the world has shifted, to one of free enterprise and free markets, where the private sector is said to be the main instrument of economic growth and development. This is the new conventional wisdom, and in Pakistan too, the dominant view in public policy circles, both independent and government, is that the public sector is a major burden on the exchequer, that state-owned enterprises are always mismanaged, cesspools of corruption, inefficient and loss-making—see Box 8.4. And hence, they should be privatized.

Given the actual performance of such enterprises, especially in Pakistan, it does become difficult to make a case for the defence of such institutions and organizations, especially when public perception also supports such claims. However, it would be unfair to dismiss the public sector in one sweep and make arguments for the privatization of all state activity. A more careful analysis of the public sector is required to provide a more balanced view and not to be caught up in the fashion of the times, such as privatization.

8.5 The Privatization Process

One of the most controversial and interesting aspects of the Structural Adjustment Programme since 1988 has been the privatization programme begun in 1990. Six years later, in 1996, it was still provoking strong reactions by observers (see Box 8.5). While governments may be pleased at privatizing a reported 65 per cent of the targeted industries, the way the process had been managed and the consequences of this programme have been subject to debate, controversy and mainly criticism (see Appendix 8.3 in the first edition of this book).

A large-scale privatization effort was launched in November 1990 by the Nawaz Sharif government when the Disinvestment and Deregulation Committee was established to identify the enterprises to be privatized and to make recommendations on how this process should take place. Earlier, the first Benazir Bhutto government also paid lip-service to the concept, and said that it would privatize the state-owned sector, but no manufacturing industry was targeted for disinvestment and not much in the form of privatization actually took place. The reason that the government gave for the slow pace of privatization was 'that it wanted to conduct an exercise that was transparent, well-conceived, and broad-based'.[62] Most critics felt that the government was dragging its feet and lacked the commitment and political will to carry the policy through.

The Disinvestment and Deregulation Committee established the principle that the government should completely retire from the production of industrial goods, and identified 109 industrial units that should be privatized at the earliest opportunity, and four of the five nationalized commercial banks, which had 88 per cent of total deposits with them (see Table 8.24). The Committee was dissolved and replaced by a Privatization Commission in January 1991, which was to supervise the privatization process. The mandate of the Commission included the valuation of public enterprises that were to be privatized, based on the assessments made by independent consultants, the implementation of the bidding process and the supervision of the transfer of the units to the private sector.[63]

In the early phase of privatization, the programme was unsuccessful with few bidders for the targeted firms. Since privatization was a cornerstone of the government's economic policy, the government revised its strategy and accelerated the process. It improved the legal and administrative procedures, and while it had decided initially to adopt the policy of offering only a few units for sale at a time, it reversed this policy in October 1991, and advertised all the 105 industrial units for immediate sale. Attempts were also made to make the entire privatization procedure more 'transparent' and effective.

One of the reasons for privatization has been the need to raise revenue. However, this measure is fraught with problems, as an important report on Pakistan's industrial sector identifies:

> Privatization is being undertaken partly to offset declining budgetary revenue and partly to compensate for government investment shortfalls. It is hoped that liberalizing the economy and opening it up to competitive pressures will encourage private investment. An option open to the government is to commercialize public enterprises. The commercialization of some of the public enterprises has enhanced their financial performance since 1983. While an improvement in the performance of public enterprises may be a catalyst for further industrial progress, progressive expansion of the private sector will depend on a number of far-reaching changes in the industrial investment environment, including an improvement in the law and order situation which has adversely affected industrial development in recent years.[64]

Box 8.4

Why State-Owned Enterprises Fail

Ihtasham ul Haque examines the role and working of state owned enterprises in Pakistan and argues how these enterprises malfunction, having a major cost on the budget. He finds that poor governance and management are the main reasons for their failure.

In any country's economic mosaic, State Owned Enterprises (SOEs) are the mainstay of self reliant growth. They help create infrastructure, absorb technology, encourage innovation, and generate employment while serving many social objectives. Sadly, this has not been the case in Pakistan. The country's 200-plus SOEs continue to haemorrhage, incurring over Rs. 400 billion in annual losses (an amount greater than what the government spends on the development budget in the whole year). And recurrent political interventions in almost every conceivable area of decision-making concerned with the working of these SOEs are only exacerbating matters.

The losses of the SOEs have increased in recent years and are now estimated to be worth 1.5 per cent to 2 per cent of GDP. This is mainly due to poor governance, mismanagement, mounting corruption, and inappropriate policies coupled with flawed internal structures. The government has expressed its concern over the alarming health of SOEs on more than one occasion yet has failed to undertake any meaningful reform with a view to restructuring and revamping them along modern lines.

The challenge of improving efficiency and putting these SOEs on a viable commercial footing is a formidable task. "Reforms are needed, including a separation of these enterprises from operational interference by government ministries,' states the Asian Development Bank (ADB) annual report for 2012. According to the bank, the economy continues to be affected by structural problems, including a domestic energy crisis, a precipitous decline in investment, persistently high inflation, and security issues. Meanwhile, budget deficits remain high, driven by substantial subsidies and losses at state-owned enterprises, aggravated by minuscule tax revenues.

Concerned government officials largely agreed with the ADB and admit that financial guarantees outstanding against the loss-making enterprises have crossed Rs. 600 billion. 'The main hurdle in the restructuring process is the stiff opposition by concerned ministries, including the bureaucrats, and the restructuring and revamping plans are heading for a flop,' says a senior official at the Planning Commission.

Finance minister Hafeez Shaikh is blamed for not taking an interest in introducing effective reforms for these enterprises, unlike his predecessor Shaukat Tarin. The finance minister has vowed to introduce such changes but so far, no breakthrough has been achieved.

In one of her presentations, former State Bank of Pakistan governor Dr Shamshad Akhtar said that SOEs contributed almost 10 per cent of GDP. She maintains that progress on reforms within SOEs stalled because of the political and economic uncertainty and concerns regarding the valuation of companies in their current state. Based on international best practices, she had proposed the setting up of an International Finance Commission-sponsored public-private partnership, which would apply corporate strategies and benchmarks to the operational, financial and service standard performances of the SOEs, with a view to making them economically viable.

Meanwhile, the call of experts to get rid of loss-making public sector units by privatizing them has faded over time. In its initial years—particularly in the early and mid-nineties—the privatization process remained relatively successful. But eventually, the allegations of selling SOEs at throw-away prices started reverberating. Meanwhile, global economic conditions also deteriorated at a fast pace, forcing potential buyers to desist from taking part in the disinvestment process. And the recession currently gripping Europe and the Americas mean that there are hardly any funds, which can be mobilised.

The ADB's flagship annual economic publication, the Asian Development Outlook 2012, highlights public sector losses as one of the major factors impeding growth in the Pakistan. The annual losses at the SOEs are attributed to a mix of inappropriate governance, corruption, inefficiency, and flawed policy. For example, power sector losses amounting to Rs. 250 billion have resulted in the creation of the gigantic Rs. 400 billion circular debt. Other major loss-making SOEs include PEPCO, PIAC, Pakistan Steel Mills, and Pakistan Railways.

The biggest drain on the exchequer is that of the Pakistan Electric Power Company (PEPCO), which is incurring a loss of over Rs. 1 billion per day. This is despite the fact that the government has continuously increased electricity tariffs at the rate of two per cent per month since 2011. While the government claims to have added 3,500 MW of electricity to the national grid over the last four years, global power statistics issued by British Petroleum reveal that power production in Pakistan has actually decreased by 10 per cent since 2008. The losses of PEPCO power distribution companies are on the rise while revenue collection of even the billed amounts is declining. The power losses of the Sukkur Electric Supply Company, for example, exceed 40 per cent while collection of the billed amount is only 59 per cent. Similar issues mar the productivity of other supply companies, which continue to incur losses and fail to collect much-needed revenues.

The losses of SOEs peaked in 2011 when their performance reached the lowest ebb in Pakistan's history, threatening the economic viability of the state. Pakistan Railways, PIA, Pakistan Steel Mills, Pakistan Agricultural Storage and Services Corporation (PASSCO), and Utility Stores Corporation continue gobbling up additional funds, making no money of their own.

PIA has become a textbook case of poor governance and political intervention and suffers losses of Rs. 70 million daily. (Its cumulative losses are estimated to be substantially more.) The last three years have witnessed the recruitment of over 2,300 people in PIA, who translate into a Rs. 100 billion loss. Promises to rightsize PIA remain unfulfilled while the number of operable aircrafts has dwindled to half. Instead of focusing on the cause of this efficiency, the government has offered PIA long-term financing for working capital, guaranteed its borrowing, and continues to pay financial charges on selected debt securities.

Meanwhile, Pakistan Railways burns Rs. 50 million every day of the year, after having incurred a loss of Rs. 35 billion in 2011–12. Since the current government took power in 2008,

PR has retired 104 of its 204 trains. Even though PR has almost come to a halt, the government has not laid off a single employee. This is despite the fact that the PR management admits that of its 110,000-strong staff, only 40,000 are required. In the meantime, PR gets Rs. 2.5 billion a month from the government for payment of salaries and pensions alone.

Pakistan Steel, on the other hand, has been out of production for several months due to want of raw material. Even so, a total of Rs. 30 billion has been doled to PSM to help cover the financial losses caused primarily by overstaffing on political grounds and rampant corruption and nepotism.

While some SOEs such as the two ports, OGDCL, PSO, SSGC, SNGPL, and the insurance sector are still showing some profits, the point to remember is that they still lose a significant amount which remains hidden due to the inherent profitability of such entities.

In a 1954 speech, former Indian premier Jawaharlal Nehru referred to SOEs as the 'temples of India' in view of their importance to the economy. But in Pakistan, the biggest impediments to the revival of SOEs are the shoddy quality of their boards, the lack of ownership and accountability, as well as a flagrant disregard of merit in appointments. The government must learn to look beyond the tip of its decidedly political nose and implement strict reforms. It must decide whether it is the business of the government to run business and, if so, what are its security-related or economic reasons for doing so. And finally, it needs to manage these investments on a sound commercial basis, separated from the government's function of policy making, market regulation or social obligations.

Box 8.5

Privatization Controversy Reveals Some Unsavoury Aspects

A number of articles in the press criticized the government of Benazir Bhutto for its policy and manner of privatizing state-owned enterprises. Sultan Ahmed writes:

The controversy in respect of privatization of large public sector units is getting heated again, and is acquiring an increasing number of disturbing facets.

The disputes are over the timing of privatization of large public sector units, such as UBL, Bankers Equity, and the selling of 26 per cent of the shares of the Pakistan Telecommunications Corporation (PTC) to a strategic buyer, over the specific use the large sale proceeds of what is often described as the family silver should be put, and about the methodology or transparency of the transactions which have not been found to be satisfactory.

The question of timing of the sale is very important. To begin with, share prices in Pakistan are low, and the Karachi Stock Exchange price index at 1,488 is about 44 per cent below the peak of 2,661 achieved twenty months ago, and has been in the doldrums for too long a time without a significant and sustained break. Worse still, the PTC shares sold abroad at Rs. 55 per share have swung between Rs. 28 and Rs. 30 making many foreign investors disinvest and move to greener pastures.

Foreign investors are usually ready to buy shares of bigger enterprises when the economy is booming, and not when it is stagnating and when they see that an economic breakthrough is imminent. That is not the case in Pakistan as the economic growth has been too low during the last three years—2.3 per cent, 3.8 per cent and 4.7 per cent despite the high growth targets set for each year. The growth target set for the current year [1995/6] is 6.9 per cent, and expectations suggest that the performance this year will be better than earlier years, particularly as the cotton crop may be as much as 10 million bales or more.

For a number of reasons, not only former Prime Minister Nawaz Sharif and former Finance Minister Sartaj Aziz have cautioned against hasty privatization of large public sector units but President Farooq Leghari has also joined the chorus. Addressing the two-day Asia-Pacific Privatization Conference in Islamabad he said: 'We cannot allow distress sale of our national assets', and wanted the privatization to take place in the best possible financial and legal environment.

When it comes to the using of the sales proceeds of privatization there is a large national consensus that they should be used for reduction of the overwhelming national debt, domestic as well as foreign. During the days of Moeen Qureshi as caretaker Prime Minister, he set up the Debt Reduction Fund to which the sale proceeds of privatization were to be credited. Dr Mahbub ul Haq is emphatic that the funds should be used for reducing the costly debt.

The government, however, has other ideas and it has talked of setting up a 'Future Generations Fund' and utilizing that for promoting education, employment, etc. And it has already used Rs. 11 billion for its Social Action Programme [SAP] and has budgeted for an outlay of Rs. 12 billion this year on the SAP.

How much is the money received so far from privatization? Various figures have been given, but not a clear well audited picture. We need a clear and complete picture now. Makhdoom Shahabuddin, Minister of State for Finance, said recently that until June 1993 Rs. 5.467 billion was received from privatization and since then Rs. 30 billion, making a total of Rs. 35.47 billion. But then, through the sale of 6 million vouchers of PTC alone Rs. 30 billion was received. He also said the Privatization Commission had so far used Rs. 13.98 billion for reducing domestic debt to the extent of Rs. 6.13 billion and the balance for the SAP.

Commenting on the issue, President Leghari has said the cynicism about privatization must go, and it is for the Prime Minister, the cabinet, and the Privatization Commission to ensure that the cynicism is replaced by enthusiasm at the national level. 'It is time the government came up with a categorical well-audited statement on the use of the privatization fund for debt reduction and gives complete details of the funds received, spent, and the balance.'

The third controversy is over the methodology of the privatization and the extent of transparency. The latest controversy in this regard is around the sale of 266 kanals of land belonging to the Pakistan Engineering Company (former Batta Engineering) at Badami Bagh, Lahore for just Rs. 362 million which will reduce its overwhelming liability of Rs. 709 million only to some extent, and the government and the company will be the loser for it.

The buyer is the big gainer as after buying it he got the stipulation, that the land should be used only for industrial purposes, deleted. If this condition had been deleted before the sale of the plot in the key market area with the Badami Auto-Market next door, the government might have got Rs. 900 to Rs. 1,200 million, and the liabilities of the company would have been wiped out altogether. It has also been argued that if instead of the 266-kanal plot being sold as a single piece it had been split into three or four plots, even with the stipulation that it should have been used for industrial purposes only, it would have fetched about Rs. 100 million. Hence, the disappointed candidates for buying have appealed to the PM for cancelling the same and some are proposing to move the courts for its cancellation.

It is to prevent such controversies and deep suspicions that President Leghari called for the kind of privatization that is clear and transparent and done with full awareness that the family silver was not thrown away. He said 'we gave hell to the IJI government when we were in the opposition for its non-transparent methodologies of privatization. Criticism of these methodologies still persists.' And clean and transparent privatization was the answer to it.

A long catalogue of major enterprises awaits privatization, while the IMF is castigating the government for being slow or dragging its feet. Among them are the public sector banks and DFIs [Development Financial Institutions], power and gas enterprises, mining and engineering projects, while the canal system is not to be privatized in the immediate future.

According to the Chairman of the Planning Commission, the pace of privatization is purposely slow, so as to avoid allegations of impropriety. But being slow alone is not enough, as the case of PECO has shown, as too many persons were interested in that precious land which was finally sold so cheaply. The President's comprehensive advice in respect to privatization has to be taken seriously by the government and the Privatization Commission, if the controversy is not to get overheated as more large projects are put on sale.

Source: World Bank, *Pakistan: Country Economic Memorandum FY93: Progress Under the Adjustment Programme*, Report No. 11590-Pak (Washington DC: World Bank, 1993), 51.

What was true in the late 1990s, seems truer in 2012, and it seems that two decades later, many of the issues and themes are almost identical. (See the very interesting analysis in Appendix 8.3 on the politics of the privatization process of electricity in Pakistan, analysis which finds that the severe electricity shortfalls of 2008 onwards have their genesis in the deeply flawed privatization policies many years ago—also see Section 8.7 below.)

The result following the renewed vigour to privatize in October 1991 was that, by November 1992, 67 of the 109 units had been issued letters of interest to sell. Of these 67, the management of 49 units had been transferred to the private sector, and an amount of Rs. 6 billion (of the total Rs. 13.3 billion for the 67 units) had been received by the government. One reason why the privatization programme did not develop on the lines that the government hoped it would was that most of the companies put on the 'for-sale' list 'were already technically bankrupt'[65] and hence interest from buyers was low.

The three most coveted sectors to be privatized were the energy sector, telecommunications, and the four commercial banks. By late 1995, the telephone and telegraph sector had been partially privatized and of the banks, the Allied Bank Limited was sold to its employees, and the Muslim Commercial Bank to a private business house. The balance sheets of the banks show that these 'newly privatized banks have rapidly improved their performance'.[66] Two commercial banks, the Habib Bank Limited and the United Bank Limited, and two industrial banks, the National Development Finance Corporation and the Industrial Development Bank of Pakistan, were privatized by the Musharraf government after 1999, as were other important and large public utilities, such as KESC and Pakistan Telecommunication Company Ltd (PTCL), both to buyers from the Gulf states, who were the new owners of United Bank Limited as well. However, a report by the World Bank made the following interesting observations about the banking sector:

> It has been a problem for potential investors to gain access to sufficient information about the quality of the assets of banks. Whereas domestic investors seem to be able to overcome this, robust foreign investors that require the information be presented according to internationally recognized standards are believed to be unsatisfied with quality and quantity of the data. This obstacle will be especially important for Habib Bank, which as the largest financial institution to be privatized probably cannot be sold exclusively to domestic investors. However, the government remains committed to privatize all state-owned banks (except the National Bank of Pakistan).[67]

Interestingly, towards the end of 1995 the United Bank Limited was offered for sale and only foreign bidders remained in the final stages of the process, a move which came in for criticism from concerned economists. Nevertheless, in 2003 the bank was eventually sold to businessmen from the Middle East.

All the evidence seems to suggest that the process of privatization came in for a great deal of criticism in earlier years. The Institute of Developing Economies in Japan identified the following criticism of the process:

> The privatization process was severely criticized by several quarters for the lack of transparency, and the inadequate attention paid to the antecedents of the new management. It was suggested that the bid evaluation procedures were incorrect, and furthermore, inconsistently applied from case to case. It was also alleged that the process suffered from favouritism, as some bidders had privileged access to information and competing bids. In a number of cases, units were transferred to management that had no previous record or experience of running an industrial unit at all; in others the new management had defaulted on its loans from the banking system even though the Commission had stipulated that previous loan defaults would invite an automatic disqualification. The government's response to these allegations, apart from a denial of any deliberate wrong doing, was that speed was of the essence, in order to overcome the inertia generated by vested interest groups.[68]

In another equally critical appraisal of the privatization process, Nawab Haider Naqvi and A. R. Kemal questioned the entire concept of privatization and showed how the process resulted in serious negative consequences.

> We share the view that public and private investments are essentially complementary in nature; and that while private investment holds the greatest promise in areas where productive efficiency matters, its success depends on a well-thought out programme of public investment which first provides an efficient infrastructure. Furthermore, public sector investment in those productive activities where the market 'fails' due to the externalities dominating there, or where no markets exist, is essential to maximize social output notwithstanding the contrary claims of the privatization enthusiasts who attribute every possible economic ill to the so called phenomenon of 'government failure'. Also, recognizing that public sector investment—even in the productive activities—is a fact of economic life in Pakistan, it is essential that privatization should take place where it has the most promise of adding to productive efficiency and economic growth. Indeed, efficiency (and growth) considerations must be seen as the only valid grounds for privatization. And in this context, there is enough empirical evidence in Pakistan to show that changing the locus of ownership from public to private is neither a necessary nor a sufficient condition for achieving any of the avowed goals of privatization; even on theoretical grounds, other objectives for going private—e.g. mobilizing financial resources for the government—had better be achieved by other, more effective policy instruments. *Indeed, the real-world experience suggests that across-the-board privatization, taking place mostly on*

> *ideological grounds, may prove not only self-defeating but positively counter-productive*. Thus, profitable companies can as well be given over to their (not-too-worthy) competitors, exacerbating the degree of concentration in the economy; and the (apparently) defaulting enterprises may in fact be given away to friends of the regime, thus increasing the element of 'crony capitalism'.[69]

Given this extensive criticism, Aftab Ahmad Khan identifies some reasons why there has been so much criticism of the privatization programme:

> An imperative for the success of privatization is the transparency of the process to avoid people's suspicion and ensure their support. All aspects of the privatization exercise must be out in the open and there should be no suspicion of political patronage, corruption, favouritism, or cronyism in implementing it. Unfortunately, this important dimension of privatization has not been given due attention in some privatization transactions and this has resulted in casting doubts on the integrity of those responsible for deciding the choice of parties in the cases. The privatization exercise in our country so far has been suffering from a lack of proper planning. There has been no systematic approach to timing, prioritization, sequencing, classification of units, valuation, and modes of privatization. If one of the purposes of privatization is to broadbase share ownership and expand the equities market, then it is imperative that all sales are quickly followed by successful flotations. A significant proportion of the privatized firms have yet to float equity in the market.[70]

Despite these numerous hard-hitting criticisms of the privatization process in Pakistan, and despite many prescient warnings by many academics and observers, the privatization process under General Musharraf's government, especially in the mid-2000s, gathered a lot of steam, as well as an equal amount of controversy. Some of the comments made in the excellent study of the Institute of Developing Economies in Japan, in 1994, were proven true in 2005–07, when numerous scandals around enterprises expected to be privatized were unearthed. The biggest, of course, was regarding the Pakistan Steel Mills, when it became clear that many of General Musharraf's leading cronies, including the Prime Minister, Shaukat Aziz, may have been involved in underhand dealings. The Chief Justice of Pakistan and the Supreme Court of Pakistan challenged the privatization of the Steel Mills, and exposed a number of issues which revealed corruption of sitting members of the government—see Box 8.6. This decision taken by the Chief Justice and the Supreme Court of Pakistan upset General Pervez Musharraf a great deal and tarred his government with proof of corruption. It was one of the reasons which led General Pervez Musharraf to dismiss the Chief Justice of Pakistan in March 2007, which eventually led to a process of bringing about General Musharraf's downfall.

8.6 The Debate over Efficiency in the Industrial Structure

Following the end of the boom in industrial development in the late 1960s, a number of books and papers were written on Pakistan's industrial performance, and the collective view was that the high growth had been achieved at very considerable costs, and that the entire industrial structure was severely inefficient.[71] For many years, perhaps even two decades, the issue of efficiency in Pakistan's industrial sector, became one of the main academic and research questions for Pakistani economists. The policy instruments that were held responsible for creating this inefficiency rested on the extent and degree of state intervention in distorting prices in the domestic market, which was said to affect the manufacturing sector adversely. As we saw in Chapter 6, much of Pakistan's early industrial and economic growth was predicated on an import substituting industrialization policy, which was the conventional wisdom of the times and was being followed by most young developing countries. The main tools for such a policy consisted of protecting domestic industry by building up trade barriers in the form of tariff and non-tariff restrictions, using multiple exchange rates, and import licensing.

The main work that sparked off the debate over the inefficient nature of Pakistan's industrial structure was undertaken by Ian Little, Tibor Scitovsky, and Maurice Scott,[72] who challenged the then premises of import substitution, protection, and the industrialization process. This study found that amongst the developing countries studied, Pakistan had the highest effective rates of protection (see Box 8.7) in manufacturing. Recalculating the manufacturing sector's contribution to value-added, the authors found that the industrial value-added actually grew at a *negative rate*, and not at 16 per cent as believed. The conclusions of the study were that too much emphasis had been given to the manufacturing sector and, hence, the agricultural sector and manufactured exports had suffered. The policy tools that caused these distortions did so in the following manner:

> The policy tools which were deemed to be responsible for this distortion were the multiple exchange rates, the tariff structure, and to some extent the system of import licensing. The multiple exchange rates meant that exporters imported their inputs at a below par exchange rate and then exported their goods at a higher rate. Also the existence of an export tax, in certain industries such as leather and cotton, meant that there was a disincentive for exports as compared to sale in the local market (where because of protection a preferential rate could be commanded). As for imports, the overvalued exchange rate meant that whereas raw materials and machinery was imported at the official exchange rate it was sold in the market at its full scarcity premium.[73]

Another study revealed that in 1964 about 75 per cent of actual value-added was due to distortions in the industrial

Box 8.6

Corruption, Fraud, and the Privatization of the Steel Mill

Two articles from 2006, when the Pakistan Steel Mill was put up for sale, or privatization, reveal the deep involvement of the most important political leaders of that time.

1. Sabihuddin Ghausi writes:

Within 22 years after its full commercial operations in 1984, Pakistan's only integrated steel mill in the public sector, which has been operating on optimum capacity for at least last three years, was passed on to a consortium of foreign and local investors at a price that is being called "peanuts" and a "no price at all" by employees unions, stock brokers, and independent economists.

Only a day before the bidding for Pakistan Steel, market analysts were putting the price of 75 per cent shares at $1 billion plus. The worth of real estate only (4,546 acres of land on which various units of Pakistan Steel are constructed) was estimated at Rs. 27 billion in March. One of the leading real estate dealers of Pakistan and a top stock broker was approached by the Pakistan Steel authorities to advise them on privatization modalities and valuation of the assets.

The developed land of steel mill was valuated at Rs. 5.5–6 million an acre and the undeveloped land at Rs. 3–3.5 million an acre. Way back in 1974, Pakistan Steel obtained 19,000 acres of land from the Sindh government at 74 paisa per square yard. But the infrastructure developed on this land from taxpayers' money has enhanced the market worth of land at present to Rs. 20 million an acre. This is because there is now 110km metalled road, 70km railway track, a 165 megawatt electric power generation station, a water treatment plant, and a jetty.

But on 31 March, all these assets were given to an investors' consortium for Rs. 21.68 billion ($362 million). Prior to this bidding, there were planted media reports on worn out machinery of the steel mills that now need replacement and revamping. But all credit goes to the management and employees who kept operating their mills at 100 per cent capacity for the last three consecutive years with no major mishap. In 2003, President Pervez Musharraf had announced a bonus for the staff in recognition of their hard work.

The Employees-Management Consortium is offering Rs. 24 billion and is demanding their first right of refusal in the transaction. It is not being heeded either by the Privatization Commission or by the prime minister's office. A stock broker on Thursday offered an immediate payment of Rs. 30 billion for Pakistan Steel.

The consortium that won the bidding includes a Saudi group Tuwairqi, a Russian group M. Magnitogorsk Iron and Steel Works, Arif Habib and Siddique Sons. This consortium offered a bid of $362 million (Rs. 21.68 billion) at a rate of Rs. 16.80 a share. Awais Leghari took the charge as Privatization Minister recently after Dr Hafeez Sheikh quit. Pakistan Steel's privatization was his first assignment and contrary to past practices he immediately issued the letter of acceptance to the successful bidder as he said that he was authorized by the cabinet committee.

The practice is that the successful bid is considered by the Cabinet Committee on Privatization chaired by the prime minister. The Privatization Commission issues letter of approval only after the CCoP has considered all aspects of the successful bid. It was not done in the case of Pakistan Steel. The Privatization Commission did not disclose the reserved or reference price of Pakistan Steel. There is no report as to who was appointed as the financial consultant and who carried out the valuation of the assets.

What makes the deal more intriguing is stone-laying of a 300-million-dollar billet plant of the Tuwairqi group on a 220-acre plot at the Port Qasim. This group is reported to have given $10 million donation for the renovation of Quaid-i-Azam mausoleum. After the Port Qasim billet plant comes into production, with one million ton production line after two years or so, the Tuwairqi group will enjoy almost a monopoly status on a industry that is called "mother industry". The steel industry is the basis of all other industries and if it comes under the control of a group that is alien, it is fraught with all consequences.

For long, Pakistan remained an importer of steel. The powerful lobby of steel importers made it sure to torpedo every effort to set up a steel mills project in Pakistan during the 1950s and 1960s. Steel Mill was called a "white elephant" when set up with the Soviet assistance at a total cost of Rs. 25 billion in the 1970s. There were many hurdles in the implementation of the project, and it was an irony of the events that the late Bhutto had laid the foundation of this project in 1974 and its commissioning was inaugurated in 1981 by the late General Zia.

From 1981 till this day, there were about 22 chairmen. In 1990, as many as six chairmen came and went in Pakistan Steel in a single year. Pakistan Steel's annual procurement of raw material and sale of steel products were worth more than Rs. 30 billion and therefore, all the powerful actors of state—bright stars of civil service and those in uniform—claimed their ounce of flesh from the project. Pakistan Steel is a classic example of inefficiency and corruption of Pakistan's high and mighty but a model of hard work of engineers and workers.

2. Privatization of Pakistan Steel Termed Biggest Scam

Representatives of more than 50 labour, political, social, and human rights organizations have expressed their strong reservations over the process of the privatization of the Pakistan Steel, and described the sale of the national asset as 'the biggest scam' in the country's history. They were speaking at a one-day consultative meeting held here on Sunday under the auspices of the Labour Education Foundation under the title: *Steel Mill Privatization—A Fraud*. The meeting was chaired by Mr Saleem Raza, Secretary of the LEF.

Speakers on the occasion pointed out that the Rs. 300 billion worth concern had been handed over to the private sector parties at a throw-away price of Rs. 21.75 billion. They claimed that under a pre-planned conspiracy, it had been handed over to some favourite parties. The conspiracy, they

added, had been hatched over the past six years. They alleged that it had already been decided to hand over the PS to a consortium of Russia's Magnitogorsk Iron & Steel Works Open JSC, Saudi Arabia-based Al-Tuwairqi Group of Companies and a local firm Arif Habib Securities whereas the bidding process was for its privatization on 31 March was just an eyewash. They wondered that the auction, which the Privatization Commission had taken one whole year to prepare for, lasted just 30 minutes.

They pointed out that it was only a day before the auction was held, that a $130 million steel factory, Al-Tuwairqi Steel Mills, was inaugurated and a piece of 220-acre land was obtained on rent from the PS for the new concern. They added that 45 million cubic feet gas and 180 megawatt electricity was also sanctioned for the group. They quoted an ex-chairman of mills, Haq Nawaz Akhtar, as saying that the PS would have fetched a higher price even if sold as scrape.

They said that only two days before the auction, the Al-Tuwairqi Group had signed Head of Terms (HoT) with the Sui Southern Gas Company for the supply of 45 million cubic feet natural gas for 10 years and the contract was extendable for another 10 years. They feared that with the PS in its ownership, the group might establish its monopoly on the whole steel industry in Pakistan which would ultimately result in a sharp increase in the prices of iron and steel products, dealing a blow to a large number of local industrial concerns.

The participants said that before the privatizing of the PS, all bank loans outstanding against the mills had been paid off so that the new owners did not have any liability. In this regard, they added, the last instalment of Rs. 2.5 billion Habib Bank loan had been cleared by the government. They said that until 1999, the mill was burdened under Rs. 19 billion loans and its annual loss stood at Rs. 9.326 billion. Later, it was administratively handed over to retired military officers who started sacking workers to curtail the losses. In 2000, the PS had a workforce of 20,533 which had shrunk to 13,080 now.

The speakers said that according to the PS finance director, the mills had generated Rs. 26.1 billion revenue in 2000 and its pre-tax profit stood at Rs. 4.85 billion. They recalled that on Oct 25, 2005, PS chairman Gen. Abdul Qayoom addressed factory workers and announced that in the year 2004–05, the mills had generated Rs. 31 billion revenues and its pre-tax profit was Rs. 10 billion. He had quoted the tax amount paid to the government at Rs. 8.9 billion. The labour leaders pointed out that present value of the PS land, at the current rate of Rs. 20 million per acre, was around Rs. 92 billion whereas the mills' other assets had been estimated at more than Rs. 150 billion. Furthermore, they added, that the new owners had been given an inventory of Rs. 7 billion kept ready in stores, besides finished products worth more or less the same amount.

They said that besides the precious land on the coastal belt near Port Qasim, the other assets of the mills include Steel Ore Plant in Thatta district, water supply plant of 110-mgd, thermal power plant, oxygen power plant, 72-km railway line, 14 locomotives of 800 horsepower each and more than 100 railway wagons. They claimed that only these assets were worth more than Rs. 150 billion.

They said the thermal power plant of the PS supplied electricity to the mills and its township while selling the surplus power to the KESC. Its oxygen plant supplied oxygen to various industrial units and hospitals. The labour leaders deplored that the PS had been sold for an amount which made just two and half years' tax it paid annually. Quoting a statement of the PS finance director, they said the mills had a cash and bank balance of Rs. 12 billion. They revealed that just one month before of the privatization, as many as 80 brand new vehicles were purchased for the mills.

They said that the PS was maintaining a production capacity of 98 per cent and its profit was on the increase every year. They questioned the justification for the sale of the PS when the factory was functioning well, its workers making no major demand and the mills paying over Rs. 9 billion per year tax. They criticised certain political, religious and ethnic organization which had been keeping a discreet silence over the privatization of the mills. The labour leaders lauded the role of labour organizations for raising their voice against its privatization from day one.

They said that on 28 April 2006, the privatization commission had announced a package of Rs. 16.6 billion for Pakistan Steel workers. Considering the package and the cash in hand amounting to Rs. 10 billion, it could be determined that the mills had actually been sold at a loss of Rs. 5 billion. Welcoming the status quo ordered by a full bench of the Supreme Court vis-à-vis the sale of the mills, they demanded withdrawal of the decision to privatize the PS and institution of a corruption case against those involved in the affair.

structure. Due to this protection, according to this study, the manufacturing cost of value-added was increased by an average of nearly 300 per cent compared to what the cost would have been had there been no protection.[74]

The analysis from the work on protection, distortion, and inefficiency in the industrial sector in the 1960s suggests that the following principal distortions were created: the neglect of agriculture at the cost of industry; excessive emphasis on the manufacturing sector, resulting in poor export performance; a distorted sectoral distribution in industry (i.e. between the consumer, intermediate and capital goods industries); and a disincentive for technical change, as the existing structure would not have encouraged much development in technology because returns were already very high.[75]

However, all the evidence presented in the earlier chapters, particularly Chapter 6, shows that none of the alleged consequences followed. In fact, one sees the reverse, with agriculture showing very high rates of growth throughout the 1960s at a time when there was supposed to be considerable anti-agricultural bias in policy. We also see that, despite the import substituting strategy, there was actually no distortion of the sectoral distribution in industry, and although the consumer goods sector showed high growth, as it should

Box 8.7

How Does One Measure Protection and Inefficiency?

Viqar Ahmed and Rashid Amjad discuss the methodology used in the calculation of effective rates of protection, and show how we come up with such concepts as a 'negative' value-added by industry.

> Basically, these exercises calculate the cost of inputs and the value of outputs first at 'market' or 'domestic' prices, which include protection and other subsidies, and compare these with the costs of inputs and the value of outputs of similar (or nearly so) goods at what they would be in the 'world' market or 'trading prices', i.e. if they were bought and sold in the open world market. The rate of effective protection is then defined as the per cent of value-added due to protection.
>
> A simple version of this concept may be shown as follows:
>
> Value-added in industry 'i' at 'market' or 'domestic' prices $= w =$ sale value of output minus cost of inputs
>
> Value-added in industry 'i' at 'world' or trading prices $= \hat{w} =$ sale value of output minus cost of inputs
>
> Effective rate of protection of value-added due to protection $= \dfrac{w - \hat{w}}{w}$
>
> Let us illustrate by taking three different cases. Suppose value-added at 'domestic' prices is a hundred but at 'world' prices is only ten. Then value-added due to protection or the effective rate of protection is 90 per cent. In the second case, suppose value-added at 'domestic' prices is again a hundred but at 'world' prices is negative, i.e. sale value of output is less than the cost of inputs (say minus ten). In this case then, as the rate of effective protection is > 100, it would imply *negative value-added* by that industry. What this means is that rather than add value to the inputs it uses, it actually 'loses' value when we evaluate the inputs and outputs at world prices. Finally, suppose value-added at 'world' prices is greater than value-added at 'domestic' prices, then this would indicate that the protection system is discriminating against the output of that industry (for example, tariffs on inputs exceed tariffs on output).

Arshad Zaman also measures EPR as follows:

> The concept of effective protection was designed to be a summary measure of the degree of incentive provided to an industry, and is usually measured in terms of Effective Protection Rate (EPR), defined as the difference between value-added at domestic prices (VAD) and that in world prices (VAW), expressed as a ratio to the latter. Thus:
>
> $$EPR = \frac{VAD - VAW}{VAW} = \frac{VAD}{VAW} - 1$$
>
> In practice, a number of assumptions are made in calculating EPRs which should be borne in mind. First, the calculations assume that domestic producers are taking full advantage of the protection offered by the tariffs. Where there is significant smuggling, this is clearly not the case, and the degree of protection is overestimated, perhaps by a wide margin. Similarly, where prices are controlled, the producers are unable to exploit the potential advantages of protection. Second, survey data on which EPR estimates are based typically exhibit under-reporting of production, imparting again an upward bias to protection estimates. Third, price comparisons based on reported CIF import prices reflect underinvoicing of imports, and consequently lead to overestimates of implicit EPRs. Finally, the substantial variation in production coefficients across firms makes precise policy formulation difficult. Due to these problems of interpretation and estimation, the actual level of effective protection should not be taken too seriously, the ranking by industry is more relevant.

Sources: Ahmed, Viqar and Rashid Amjad, *The Management of Pakistan's Economy, 1947–82* (Karachi: Oxford University Press, 1984), 211; Zaman, Arshad, 'Effective Protection and Performance of Public Enterprises in Pakistan', *Public Enterprise*, 1986, vol. 7, no. 1, 43.

have under these circumstances, the intermediate and capital goods sectors also showed very high rates of growth.

The evidence that total factor productivity growth and growth in labour productivity were considerable also confirms that there was substantial technological dynamism in the industrial sector. As Meekal Ahmed argues:

> There is little support for the arguments, that the rise in the productivity of labour in Pakistan is to be explained mainly in terms of a strong factor substitution effect combined with insufficient innovations, or that high effective rates of protection are symptomatic of high costs. On the contrary, the present analysis shows that manufacturing industry in Pakistan has, in general, demonstrated a high capacity for technological adaptation and innovational assimilation, a result which is substantiated by the important role that technical progress and increasing returns play in explaining the pattern of labour productivity advance. Cost reductions were, however, not adequately reflected in price reductions in oligopolistic markets. Hence the fact that prices remain relatively stable in the more dynamic sectors of production means that the potential for changing the pattern of production in response to the unequal incidence of productivity tends to operate much more weakly.[76]

Asad Sayeed concludes that 'there seems to be no conclusive evidence on the existence of technological ossification or other related inefficiencies in Pakistan's manufacturing

sector during the decade'.[77] The reasons why the work by Little, Scilovsky, and Scott and by others consistently came up with the conclusion that Pakistan's industry was inefficient are discussed below.

Another criticism launched against the industrial policy of the 1960s in Pakistan relates to the hypothesis that despite having scarce capital, the incentive structure was such that there was underutilization of capacity, and hence an expensive and scarce resource was being wasted. This argument ran as follows:

> Little et al. argue that in an environment where the relative cost of capital is artificially low, there will be a tendency towards over-capitalization. Also, other government controls, primarily in the form of import licensing, further exacerbate the problem of capacity utilization as the import of raw materials is linked to the acquisition of these licences as well as the availability of foreign exchange. Particularly in the case of Pakistan, the argument goes, since import licences for raw materials were linked to installed capacity, this created a tendency to install new plants in order to avoid raw material bottlenecks. To the extent that this problem exists, as the evidence put forth by Hogan and Winston suggests, this is unfortunate as the primary problem of development is deemed to be scarcity of capital and here we have a situation where there is idle capital.[78]

Asad Sayeed, examining this proposition with respect to Pakistan in the 1960s, concedes that while the rate of utilization of capital was increasing over time, the absolute level was still low (see Table 8.25). However, examining the data, he concludes that it was structural constraints—such as the inadequacy of demand, infrastructural bottlenecks such as power and transport, scarcity of skilled labour and problems of assimilating foreign technologies—which were primarily responsible, rather than the constraints pertaining to the misallocation of resources as the neoclassical orthodoxy would have us believe.[79]

Akbar Noman has argued that the claims made by Little et al. regarding inefficiency are 'highly misleading'. He argues that these authors 'derive their estimate of value added from the calculations of effective protection rates made for Pakistan. These suffer from the familiar problems of data and interpretation, *though quite possibly more acutely for Pakistan than most cases*'.[80] In the case of Pakistan, the calculation used to establish inefficiency employed figures for value added at world prices that were understated, and effective protection rates that were overstated. Akbar Noman also shows how effectively and pervasively underreporting of output by firms in Pakistan takes place by 'very considerable margins'.

Unfortunately, a number of important works on Pakistan have taken for granted the evidence and data provided by the numerous studies conducted after the 1960s, without questioning the methodology or data sources used. This has helped perpetuate the myth that Pakistan's industrial structure was very inefficient. Viqar Ahmed and Rashid Amjad also fall prey to this, arguing that

> the evidence put forward clearly showed the basic 'inefficiency' of the industrial structure, which had emerged by the mid-sixties, when compared to 'world prices'. Although it can be argued that any country starting the process of industrialization behind tariff barriers would show considerable 'inefficiency' in terms of 'world prices', there is still no doubt that the industrial structure in *Pakistan was extremely inefficient even after fifteen years* of industrialization. The reason for this was the incentive structure, created for the manufacturing sector, which put little or no pressure on the producers to cut down on costs especially capital costs of production. Also, little attention was given to the question of whether it was really beneficial for the country to set up an industry which would never really ever become internationally competitive and whose value added would in the extreme case continue to be negative even after many years of production behind highly protective barriers.[81]

However, a number of leading scholars have critically evaluated the data and evidence, and have come up with a re-evaluation of the state of inefficiency in the 1960s. Akbar Noman argues that 'the inefficiencies of Pakistan's industrialization during the 1950s and 1960s *have been much exaggerated*. They were still considerable but not so great as to rule out any justification of them as the price of rapid growth, at that stage of Pakistan's industrial development'.[82] He believes that 'the argument that high protection in the

Source: Sayeed, Asad, 'Political Alignments, the State and Industrial Policy in Pakistan: A Comparison of Performance in the 1960s and 1980s', unpublished PhD thesis, University of Cambridge, 1995, 63–4.

early years affected mainly the rate rather than the pattern of industrialization would appear to be correct'.[83] The work by A. R. Kemal and Meekal Ahmed also substantiated many of these findings, as did the excellent work by Asad Sayeed.[84] Asad Sayeed concludes his evaluation of the efficiency debate by the very important observation that 'the allocative efficiency losses that might have occurred as a result of state intervention appear to have been compensated by dynamic efficiency gains that accrued'.[85]

Another line of argument that emerged regarding the efficiency/inefficiency issue was related to industrial concentration that was excessive, and which was considered responsible for the inefficiency and deceleration in Pakistan's growth in the late 1960s.[86] However, the report by the Institute of Developing Economies concludes that 'the argument of industrial concentration provides no economic reason per se for either falling investments or inefficiency in the manufacturing sector of Pakistan in the 1960s'.[87] A. R. Kemal also believes that by the end of the 1960s much of Pakistan's manufacturing industry could 'survive without protection. The protection has resulted in higher profits and is not a result of inefficiency.'[88] The evidence on growth of total factor productivity and labour productivity, as seen in Chapter 6, shows that even though the industrial structure was concentrated, it was able to use resources efficiently.[89]

Most of the work on the industrial sector of the 1960s has tended to argue that the industrial policy was protectionist and distortionary, giving rise to deep-rooted inefficiencies in the industrial structure, which later carried on into the 1970s and caused the industrial crisis. Interestingly, a World Bank (1993) study on Pakistan has argued that the three industrial subsectors of chemicals, engineering, and textiles face domestic resource costs that are 'close to international standards and are *thus not operating particularly inefficiently*'.[90]

Table 8.26 shows the effective rates of protection and the domestic resource costs (DRCs) of some industries—a DRC coefficient above 1 indicates inefficient production conditions. The DRCs show that the textile industry is the most efficient industry within the manufacturing sector, and chemicals and engineering are only slightly inefficient. The study also argues that the 'current average effective protection levels *seem moderate*, but conceal vast differences among product groups'.[91] In the chemical subsector, industrial chemicals, fertilizers, and synthetic fibres are highly protected, while in engineering, basic metals, and mechanical products enjoy high effective protection. The electrical and electronic products are negatively protected, and protection levels for cotton spinning and made-ups are low.

While much in terms of industrialization policy and strategy changed in the 1990s and after, compared with the

Source: *Pakistan Country Economic Memorandum FY93: Progress Under the Adjustment Program*, Report No. 1590–Pak (Washington DC: World Bank, 1993), 48.

1960s, it is likely that, had the extreme extent of inefficiency identified by Little et al. actually existed, the more recent picture presented by the World Bank would have been less positive. Had Little et al. been correct, much more inefficiency would have carried over into the 1980s and 1990s than actually did. While the data, calculations, and methodology are fraught with numerous serious problems, one may nevertheless conclude that the claims of the extent of inefficiency in the industrial sector in Pakistan have been grossly exaggerated (see Box 8.8 on Total Factor Productivity in Pakistan, and Appendix 8.4 in the first edition of *Issues*).

8.7 The Energy Crisis

Perhaps the one single factor which had an impact on the industrial sector in particular, as well as the economy overall, from 2008 onwards, was the energy crisis in Pakistan. Estimates suggested that between 2–3 per cent of GDP was lost each year on account of power shortages—See Box 8.9. While electricity is now a major component in most economic activities, and hence all economic activities have suffered, but in some sectors—such as textiles and the power looms sector—the energy crisis has had a particularly severe effect. Newspaper and television reports have been highlighting the plight of the industrial sector, and for months on end in 2012, there was mass rioting across much of Pakistan, particularly in the Punjab, where most of Pakistan's industry, particularly its small-scale sector, resides. This section only raises some key issues around the power crisis and is not a comprehensive analysis of the problems affecting energy generation in Pakistan—see Box 8.10 on the politics of the energy sector, and Appendix 8.3 for a more comprehensive analysis of issues in the power sector.

In a report released in early April 2012, the Asian Development Bank stated that the absence of energy was the main constraint for economic growth, and suggested that better load-management was required to minimize commercial losses. The ADB estimated that 'losses arising from power and gas shortages held down GDP growth by 3–4 percentage points in FY2011 and FY2012. Improved management of power resources could ameliorate predictability of load-shedding to allow the private sector to better schedule work and minimize costs'.[92] Abid Burki and his colleagues in their assessment of the industrial sector in Pakistan, argued that, 'the ongoing energy crisis has crippled Pakistan's industry and economy. A conservative estimate puts the loss to industry at 13 per cent of total manufacturing sales or nearly Rs. 130 billion per annum. The energy crisis is hitting the industry at multiple levels: energy tariff increases are forcing businesses with low margins and those businesses with low margins and those who are unable to generate their own power (e.g. SMEs) to close down; unannounced load-shedding and voltage fluctuations damage machinery worth millions of dollars; unavailability of electricity harms productivity of workforce'.[93]

Akmal Hussain very succinctly summarizes the main issues in the energy crisis in Pakistan in 2012. He writes:

> The core of the power crisis lies in three facts: (a) As much as 82 per cent of total electricity production is now oil-based when oil prices are astronomically rising. By contrast, a decade ago, only 50 per cent of electricity output was fuel-based with the remaining 50 per cent coming from much cheaper hydroelectric power. Consequently, the average cost of electricity has become so high that the government simply does not have the fiscal capacity to provide the subsidy necessary to supply electricity at a price which most consumers can afford. Indeed, increasing oil-based electricity would involve doubling the price of the additional supply. (b) A related problem is billions of rupees of unpaid electricity bills by the provincial governments, semi-autonomous corporations, and federal government departments. The recovery of this shortfall prevents the government from paying its dues to the independent power producers who are then forced to cut back production. (c) Institutional weakness combined with obsolete transmission technology results in theft and transmission losses amounting to 30 per cent of the total electricity generated. The long-term solution is to invest in hydroelectric power. In the short-term, apart from improving recoveries, an annual foreign aid of about five billion dollars may be required for the next five years to achieve full capacity utilization and supply electricity at an affordable price. This means shifting our policy of confrontation with the West to cooperation.[94]

The electricity shortfall in Pakistan was around 5000 MW a day in April 2012 at a time when the full load of summer had not set in, but had been even higher, at 7500 MW in October 2011. This shortfall meant that power outages varied from between 6 hours a day in large cities to almost double that, and have been close to 16–18 hours in rural areas. This has meant that not only have domestic users not had their needs met, but importantly, the main commercial and industrial users of electricity have been denied access, resulting in the loss of economic activity. While the large metropolises comprise of large domestic consumers, it is the textile and power looms sector, and most businesses dependent on crucial power supply, which have suffered most. Most of Pakistan's economic activity takes place in the largest province of the Punjab where such industry is located. Apart from Karachi, the largest city with 20 million inhabitants, power riots have spread across the industrial towns of the Punjab. Given Pakistan's political structure at that time 2011—the Punjab provincial government and Pakistan's federal government belonged to opposing political parties—the electricity shortfall had also been used to gain political mileage. According to the ADB, the cost of power generation in the country has escalated by 'almost 40 per cent in the 2 fiscal years ending FY2011. Despite steep increases in tariff and fuel price adjustments, customer tariffs remain below cost recovery, requiring large government subsidies to keep the system operating'.[95]

Box 8.8

Productivity Growth in Pakistan: Significant but not Sustained

The Panel of Economists created by the Planning Commission of the Government of Pakistan in 2010, in its overall evaluation of the economy, also looked at Total Factor Productivity (TFP) in Pakistan.

One of the fundamental questions that arises across all economies is how much of economic growth is caused by growth in physical and human capital and how much is caused by factors such as technology and institutional change. Though there is little doubt about the positive impact of increased physical and human capital on growth, most economists feel that sustained high growth is dependent on sustained technological and institutional growth. Based on the assumptions of constant returns to scale and competitive factor markets, one can calculate the growth rate implied by the rates of change in physical and human capital and find the deviations of the actual growth rate from this implied growth rate. These deviations are the result of technological and institutional change and are called growth in total factor productivity (TFP).

This Box looks at the productivity growth rates for the Pakistani manufacturing sector, the Pakistani agricultural sector and the Pakistani economy as a whole. The reason why a disaggregated analysis is meaningful in the context of a developing country like Pakistan is because of the prevailing view that agricultural productivity growth is significantly lower than manufacturing productivity growth. This has extremely important policy implications: First, if agricultural productivity is perceived to be perpetually lower than manufacturing productivity, then policymakers will tend to bias policies and incentive structures towards manufacturing (which has generally been the case in Pakistan). Second, if agricultural productivity is perceived to be lower than manufacturing productivity, then research resources and technology adoption will be more heavily directed towards the manufacturing side.

TFP growth over the period 1985 to 2005 average 2.48 per cent per year in the manufacturing sector A detailed breakdown of the growth in the manufacturing sector is provided in Tables IV.1 and IV.2. As Table IV.1 shows, the average growth rate of large scale manufacturing output is 7.8 per cent between 1985 and 2005. During this same period, the capital stock grew at an average of 6.6 per cent a year, the labour force grew at 3.5 per cent per year and TFP grew at 2.4 per cent per year. Table IV.2 presents an interesting breakdown of the components of manufacturing sector growth. 56 per cent of total large scale manufacturing sector growth was due to growth in capital stock, 15 per cent was due to growth in labour and 29 per cent was due to growth in TFP. Thus, it can be clearly seen that manufacturing sector growth has been driven primarily by increases in capital and not increases in productivity.

Figure VI.1 shows the high correlation of manufacturing sector growth with changes in productivity. As can be seen, periods of high productivity are accompanied by high growth and periods of low productivity are accompanied by low growth.

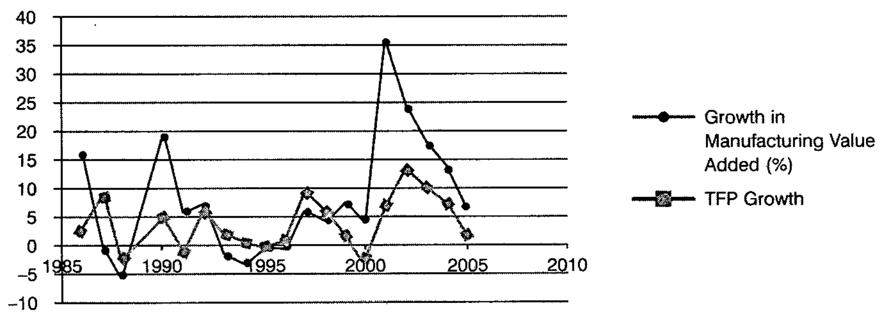
Table IV. 1: Average Growth Rates in the Pakistani Large Scale Manufacturing Sector, 1985–2005 (%)

Large Scale Manufacturing Output	Large Scale Manufacturing Capital Stock	Large Scale Manufacturing Labour	Total Factor Productivity (TFP)
7.6%	6.6%	3.53%	2.4%

Table IV. 2: Components of Pakistani Large Scale Manufacturing Sector Growth, 1985–2005 (%)

Growth on Capital Stock	Growth in Labour	Growth in Total Factor Productivity
56%	15%	29%

Figure VI. 1: Pakistani Manufacturing Sector Output and Productivity Growth



Final Report of the Panel of Economists, *Medium Term Development Imperatives and Strategy for Pakistan* (Islamabad: Planning Commission, Government of Pakistan, April 2010), 174–6.

Box 8.9

Losses Due to the Power Crisis

Mushtaq Ghuman presents an analysis of the 2011/12 power crisis and shows how this had an impact on the economy.

The country is losing up to three per cent of its GDP because of power shortages which may increase if this trend persists, a report compiled by the National Electric Power Regulatory Authority (Nepra) showed.

In its annual reports 2011–12, the power sector regulator said that the energy crisis had its roots in a number of issues, including lack of integrated energy planning and demand forecasting; imbalanced energy mix with a heavy reliance on oil and costly imports; non-utilization of vast indigenous resources such as coal and hydel; lack of effective project structuring, planning and implementation of viable projects.

According to the Pakistan Electric Power Company (Pepco), the shortfall of power in Pakistan on an average is more than 5000 megawatts. Many power plants were generating electricity at half their capacity because of fuel-related issues. The severity of power outages, it said, was persistent.

Violent protests over power cuts have become a routine in different parts of the country, besides affecting industries and businesses. Unpredictable outages, it said, had also affected industrial output because of which export of goods suffered, subsequently resulting in job cuts for industrial workers.

According to the report, over the past five years, natural gas allocation for the power sector was reduced and the use of furnace oil for power generation increased considerably. The country spent billions of dollars every year on the import of crude oil and deficit petroleum products. This has increased the cost of generation, raising circular debt, leading to higher power rates. Furthermore, the power system was afflicted by corruption and inefficiency.

It said that the situation had aggravated to such an extent in the PEPCO—the entity entrusted with the task of managing the transition of Wapda's transition to a corporate, commercially-viable and productive entity—that the survival of the Generation Companies (GENCOs), the National Transmission and Dispatch Company (NTDC) and the ex-Wapda Distribution Companies (DISCOs) is at stake.

On the one hand, there was shortage of power and on the other, Oil Marketing Companies (OMCs) and Gas Supplying Companies are not getting payments from NTDC and Discos, making it difficult for OMCs to arrange fuel for power plants. Again, Independent Power Producers (IPPs) minimized the supply of electricity despite the available capacity on account of non-payment of their dues by the Pepco and the Water and Power Development Authority (Wapda). All these factors have led to a situation where it is virtually impossible to attract new investment.

Karachi Electric Supply Company Limited (KESCL), mainly composed of various thermal power plants, has not been able to run its power plants at full capacity because of the declining supply of gas. The KESCL has not been able to arrange the required quantity of fuel from the market to operate these plants on alternative fuel due to its weak liquidity position directly linked to the circular debt crisis owing large payments to the PEPCO and the fuel suppliers.

KESCL has, at times, not produced at peak capacity, to avoid purchasing expensive furnace oil, preferring instead to purchase cheaper electricity from the PEPCO and NTDC system. This was clearly a downside of privatizing monopolies as fully integrated entities in an environment where the market was not competitively structured. The dispute between the management of the KESCL and its staff labour union has further added to the problems.

However, the new management of the KESCL has clamped down on the rampant culture of power theft in Karachi and efforts to increase the older plants' capacity are beginning to bear some fruit Besides circular debt, the other major issues hindering the overall operations of the PEPCO and the KESCL systems include gas depletion, load shedding, deteriorating fuel mix, and losses.

Gas Depletion: Historically, thermal power plants use two types of fuels namely indigenous natural gas and imported furnace oil. Initially, the power sector got the lion's share in the allocation of natural gas. However, the gas companies did not sign long-term agreements with the public sector utilities and later on, the allocation of gas to the public sector plants was allocated on an 'as and when available' basis. This pattern continued for a considerable period up to the mid eighties. However, with the passage of time, natural gas became a scarce resource because of major use in the domestic, fertilizer, and transport sectors. Lately, the allocation of natural gas for the power sector has declined to a dangerous level which is hardly sufficient to produce electricity matching the installed generation capacity.

The severity of the issue can he gauged from the fact that under the Power Policy 2002, only four IPPs were set up and that too with an annual commitment of gas for nine months. With the Gas Supply Agreements (GSAs) for these four IPPs expiring and the gas companies not willing to extend or renegotiate the same any more, it is very likely that these would he operating on alternative fuel (i.e. HSD) which will further deteriorate the thermal energy mix of the country.

Over the years, the percentage of electricity generation using natural gas has declined. This trend requires a complete reversal In order to keep the tariff reasonable for end consumers. Taking stock of the situation, the Government of Pakistan was not only exploring the possibility of importing Gas from regional countries including Iran and Tajikistan but also tapping other sources of Gas including LPG and LNG for the power sector. The government, through the Sui Southern Gas Company Limited (SSGC), was contemplating import of LNG to find a suitable alternative fuel to replace natural gas.

Load Shedding—Every segment of society including households, commercial, industrial, and agriculture is heavily dependent on the usage of electricity. Pakistan is facing an acute electricity shortage with the public being forced to stay without electricity for more than 9–10 hours in some cities and around 16–18 hours in many rural areas. It is estimated that the country was losing two to three per cent of its GDP due to power shortage, which may increase if the shortages persist. The deepening power crisis has forced many businesses to close down.

In order for the price of electricity to be affordable, it is imperative to have a proper energy mix. Over the years, the generation mix, which was earlier in favour of cheap hydel power, has deteriorated substantially. At one time, the contribution of hydel energy was around 65% in the overall energy mix of the country, which has now reduced to around only 29.15% totally disturbing the energy mix leading to an increase in the consumer end tariff. At present, the energy mix is heavily skewed in favour of thermal generation, which is mostly based on imported furnace oil. This not only leads to higher inflation but also jeopardises the competitiveness of our industry in the international market due to deteriorating natural gas allocation for the power sector, it is expected that the energy mix will deteriorate even more, further increasing the tariff for the end consumer.

On account of depleting gas reserves, most of thermal power plants being installed use imported furnace oil as the primary fuel, causing not only huge burden on the foreign exchange reserves, but also making the overall tariff for the end consumers more sensitive to price changes in the world oil market.

The report further states that the twin issues of adding power-generating capacity and stemming transmission and distribution losses on account of pilferage is a daunting task for the Government saddled with losses running into billions of rupees due to power theft during transmission and distribution and billing inefficiencies. As agricultural power supply was unmetered, many utilities wrote off all losses from the transmission and distribution as agricultural consumption. Utilities faced losses due to unmetered and unaccounted for sales.

Box 8.10

The Politics of the Energy Crisis in Pakistan

Ihtasham ul Haque gives a detailed analysis of the energy crisis in Pakistan, prevalent since 2008.

The government for the past four years has failed to come up with any short-, mid-, or long-term strategy to deal with the energy crisis. Six power plants remain shut; HUBCO and KAPCO are forced to generate half of their capacity, while up to 15 grid stations are also not working. Officials concede that the current month's 8500 MW electricity shortfall would hit an alarming 10,000 MW early next month. The independent power plants (IPPs) produce 6,250 MW, but due to non-payment of their dues, a whopping circular debt of $4.0 billion has been created, resulting in lower power generation.

Energy demand over the next five years is expected to grow by more than 7.0 per cent per annum. Forecasting, carried out by the Private Power and Infrastructure Board, up to year 2020 reveals a future demand of approximately 45,000 MW against a meagre supply of 28,000 MW, showing a shortfall of around 18,000 MW.

Back ground discussions with concerned officials reveal that the power sector, which unfortunately relies heavily on thermal generation, desperately needs around Rs. 3.0 billion a day to buy fuel, whereas collections from consumers amount to less than Rs. 1.0 billion. President Asif Ali Zardari ordered to provide Rs. 8.0 billion to the IPPs when power riots triggered in Punjab a few months ago and similar instructions given to the federal government for payments of another Rs. 8.0 billion to these power producers.

The president had instructed Petroleum Minister Asim Hussain to immediately rectify the situation, but he only ended up stopping some gas supplies to fertilizer companies and diverting it to the power sector. Hussain seems to have little idea of how to resolve the energy crisis and insists that without a long-term plan, the problem of power outages cannot be resolved. Privately, he puts the blame of the energy sector mess on politicians. The government has displayed a total disregard towards the appointment of professionals on specialized slots. The handing over the energy portfolio to Hussain—a medical doctor and former physician of the president in 2008—seems a befitting case in point. Appointment of Khalid Saeed as chairman NEPRA is another example. Some officials of the Ministry of Water & Power maintain that it is impossible to contain load-shedding until the 1600MW Neelum-Jehlum hydro project gets completed in 2016.

Apart from the immediate issue of circular debt, lack of maintenance of the government-owned power generation plants, line losses due to staggering power thefts, an inappropriate energy generation mix with less than 1.0 per cent share of coal and system losses coupled with collection inefficiency remain the major causes of the energy shortfall. In this regard, Finance Minister Hafeez Sheikh and Law and Justice Minister Farooq Naik are believed to be ardent critics of ministries of petroleum and water and power. They remain adamant that these ministries should work out fresh plans to accelerate recoveries from private consumers and the government departments as well as from the provinces, FATA, and AJK. The concerned officials maintain that without the recovery of Rs. 378 billion, the issue of load-shedding cannot be resolved.

Power shortages continue to become overwhelmingly huge as 70 per cent demand remains unmet. The power generation has reportedly dropped to a mere 9,400 MW against the total demand of 17,400 MW. Many blame it on the diversion of 680 MW to the KESC out of the total generation. The major reliance currently remains on IPPs as the rental power plants

with a capacity of 2200 MW only forecast a generation of 1450 MW owing to corruption and irregularities, blatantly pointed out by the Asian Development Bank (ADB), and eventually spawned a paltry 67 MW fleecing the tax payer of Rs. 120 billion in the process.

The 180 degree reversal of power generation mix of 70 per cent hydel and 30 per cent thermal in the 1990s is a classic example of short-sighted vision of our rulers and emphasis on 'project-oriented' and 'quick-fix' solutions as opposed to anything that could be called long-term or 'goal-oriented'.

Another aspect of the intellectually bankrupt policies is the politicisation of projects of national interest. Arshed Abbasi, an expert on water and power issues, alleges that abnormal and deliberate delay in the hydropower projects and wastage of heavy foreign exchange on RPPs [Rental Power Projects] are the biggest crimes of the Water and Power Ministry. He says that hydel power generation is being discouraged due the unprecedented influence that the thermal lobby exerts over the government.

Arshad mentions that the Board of Investment lured a foreign investment of $800 million in 2008 for the installation of a 600 MW hydropower plant, which would have sold electricity at Rs. 4.0 per unit. "But this was sabotaged by the advisor to the ministry of water and power."

The government has allocated Rs. 70 billion in the new budget for the Benazir Income Support program (BISP) which has room for a drastic curtailment to divert the much-needed funds for the IPPs. But this is now impossible as BISP is a political programme aimed at luring voters in the next elections. Additionally, Rs. 27 billion allocated as part of discretionary funds of the prime minister could also be diverted to the IPPs. Furthermore, Rs. 184 billion kept for the power subsidy can also be augmented, while cutting down huge expenses of the president and prime minister houses.

The other short term solution to the energy crisis is the removal of Rs. 400 billion circular debt and collection of Rs. 378 billion outstanding dues from the public and private electricity consumers. In addition, Rs. 166 billion are payable by the provinces and if the government could recover this amount, it could be channelled to IPPs to increase their generation to 60/70 per cent of their installed capacity.

Long-term solution lies in the early undertaking of bigger hydro projects such as the 4500 MW Bhasha Dam, which faces various issues including that of resettlements. Even if commissioned today, the project would take five years to complete. The government has also been advised by experts to convert expensive fuel-based plants into gas-fired, which would be less expensive despite importing gas. Existing thermal power plants should also be converted to coal on the fast track basis. An estimated $7–8 billion can be saved annually if the thermal plants are converted to coal from furnace oil.

Pakistan's long-term energy needs can only be met with judicious planning with regards to harnessing all the available energy resources. The country has immense power generation potential with 180 billion tons of coal reserves in Thar. Besides that, production of clean nuclear energy is also a reality since Pakistan possesses enormous human resource and expertise in this sector, which has more than 47 'safe' reactor years of operational experience. The country's 89 per cent hydro-power potential also remains untapped. Only 6,720 MW out of approximate 60,000 is being utilized, according to open book sources. Lying in the Sun Belt and having natural wind corridors in Sindh, the potential for renewable energy resources is also immense.

Source: Excerpted from Haque, Ihtasham ul, 'Powerless Pakistan', *Money Matters*, *The News*, Karachi, 25 June 2012.

Sources for Pakistan's electricity generation are primarily oil (around 38 per cent in 2010), hydel, and natural gas (both around 30 per cent). Domestic users constitute almost half of all consumption, the industrial sector (27 per cent), and agriculture (13 per cent). The problem of the shortfall, at one level, seem as simple as a supply/demand gap, related to issues of imported oil prices, and seasonal (and increasingly decreasing) water flows. However, given issues particular to the production, distribution, and pricing of energy in Pakistan, they are somewhat complicated.

Broadly, the reasons for Pakistan's recurrent energy crisis rests on the fact, that like much else of the infrastructure, in recent years, supply has outstripped demand and new developments and planning have not been able to to bridge the gap. Other complications arise as a consequence of energy losses in the power system, at the generation, transmission, distribution, and consumption stages. Transmission and distribution losses and theft alone, account for more than 30 per cent of the production of many of the larger distribution companies, (DISCOs) most of which are publically owned, either fully or partially. A vicious 'cycle of circular debt'—see Box 8.11—has emerged, where these DISCOs have to pay for electricity to the generation companies, who in turn have to pay their oil and input suppliers, but since the DISCOs receive payments intermittently and not fully, they resort to borrowing; due to the high interest costs and other reasons, debt rises, and accumulates, the government steps in when the crisis is aggravated, but the cycle breaks again. The circular debt, currently at Rs. 400 bn (USD 4.4 bn or 2 per cent of GDP), has repercussions on the fiscal state of the overall economy, as well, and given Pakistan's political economy, numerous state departments and institutions—such as the Supreme Court, Pakistan Railways, the Rangers, the ISI—avoid or delay paying their electricity dues, adding to the fiscal burden. The ADB in its report also stated that 'for every unit of power sold, there is a loss to the sector reflected in the form of subsidies. An outstanding accumulation of Rs. 220 billion was carried into FY2012, and an additional financing of 1–1.5 per cent of GDP is likely to be required in FY2012'. In addition, corruption and policy failures with regard to management and transparency—in the previous government's policy of importing 19 Rental Power Projects—have been identified by the Supreme Court, reversing some policy initiatives in the past to address the power problem.

Box 8.11

The Power Sector: A Vicious Circle of Debt

I. Faisal Bari looks at the issues around the circular debt which has accumulated in the power sector and a theoretical insight into what exactly constitutes circular debt when it comes to electricity, and some practical simple ways to get out of it

The dynamics of circular debt are not difficult to understand. When a good/service is sold/provided, the good/service moves from manufacturer or supplier to customer, and money, the price for the good/service, goes from the customer to the supplier. At each stage of production, the seller needs to be compensated as he needs to compensate those who supplied him.

The issue of debt comes in if a downstream customer is unable to pay an upstream supplier in time while the upstream one has to pay his suppliers. The upstream customer might have to resort to borrowing to ensure he has the cash flow to tide over the time while he is expecting payments from downstream. This should be a simple matter as long as the downstream customer does pay. If the payment is too delayed and the upstream supplier has to bear a large cost of interest on arranging for an alternative financial source, or if the payment does not come through or has a probability of not coming through, we have a bigger problem.

Here, the problem of circular debt can emerge when one of the producers in the value chain starts borrowing to pay others on the basis of receivables and then uses these receivables as a basis of further debt or borrows from those very people who he is supposed to pay in a subsequent period. The debt cycle will become circular, and vicious, as interest payments will keep accruing on the producer who is not able to make payments in time. This is the situation our energy sector is in.

Simplifying the matter a little, the distribution companies (DISCOs) have to pay for electricity to the generation companies, who in turn have to pay their oil and input suppliers. But the payments that the DISCOs receive, from users of electricity, come in with delays, might not be enough, and so they have to resort to borrowing to pay generators. And as mentioned, due to interest payments as well as other shortfalls the debt continues to rise to the point that it becomes unsustainable and then we get the crisis and generators refuse to produce till they are given arrears. The government steps in with some cash injection, the constraints are relaxed and the cycle starts again.

But the ultimate outcome does not change. It is a matter of time before we are in the same non-sustainable situation again.

How do we resolve the issue? It seems fairly simple. We have to pay for existing debt and have to make sure that the DISCOs are getting enough to pay for the electricity they buy in a timely fashion. Simple enough.

But if the issue is this simple, why has it become so convoluted?

Initially, the problem was that though we had done contracts on electricity generation side on commercial basis, with the IPPs in particular, on the consumer side, we were not allowing the prices to go up and reflect the cost of production. This is a frequent and common mistake when products are unbundled and markets are deregulated and/or privatized. But the price hikes of the last few years seem to have taken care of that. We are charging enough now.

Now it seems it is more a problem of electricity consumers either not paying at all or not paying on time. This includes private consumers as well, though the total amount lost due to private, especially small, consumers not paying at all or not paying on time does not seem to be huge. It is more the government departments and public sector bodies and entities that seem to be more of an issue. There seem to be significant lags in payments from larger departments.

Again there are two issues here. Either these departments just do not have the budget to afford electricity. If this is the case there is no shortcut to this than giving them the additional budget that they need. Or, it is the case that the departments have enough money but they just do not prioritise the payment to their DISCOs enough.

In this case, it is a matter for the government to be strict with these entities to ensure timely payment, or for the DISCOs to have the ability to disconnect delinquent customers, or if neither of the above can be done, for the government to step in and cover the non-payment by these entities.

If the government cannot make public sector entities pay their bills on time, and if the DISCOs cannot disconnect those who do not pay or do not pay on time, or fine those who do not pay on time, how can the problem of circular debt be addressed unless there is an injection of money from somewhere. And where can this money come from except from the government? Why would anyone else want to get involved in this problem?

The government can separate out the issue of 'stock' problem—accumulated debt—and 'flow' issue—shortfall being faced period to period. For the stock issue there is little that can be done except maybe for the government to just pay it off and cut the amount from any delinquent public sector entities that have not paid in the past to recover whatever can be recovered.

On the flow issue, the government has to give the power to the DISCOs to deal with non-payments or late-payments as they should be. If an ordinary citizen does not pay the DISCOs she is taken to the cleaners and back. Why should the case be any different for public sector entities? Imagine the audacity of these organizations: they take money from the citizens as taxes and then do not spend the money where it should be spent and in the process cause further hardship to citizens in terms of higher load-shedding. Talk about being irresponsible. If this power is not allowed to the DISCOs and the culture of paying regularly and timely is not imposed on public sector entities, and those who do not pay, private or public, are not taken to task the problem of circular debt will continue. And it will get worse.

It is good that gas and other utilities do not have the type of supply chains that electricity has or we could have the same kind of issues there too.

Having said that, conceptually, the problem of circular debt is easy to resolve: charge the right price that covers the cost of production to the consumer and make the consumer—public or private—pay for electricity on time. And, set the right

efficiency incentives for the DISCOs so that they do not hide their inefficiency cost under the circular debt issue. But if the government is not willing to do that, we will continue to have circular debt issues and the government will need to continue to dole out money. The issue could not be simpler.

Source: Bari, Faisal, 'Viscious Cycle of Debt', *The News on Sunday*, Karachi, 8 April 2012.

II. Shahid Kardar explains the mechanism of the Circular Debt.

'Circular debt' in the power sector is widely understood as an issue whose solution has eluded policymakers over the last three years. This article attempts to explain the genesis of the problem and ways to resolve it.

Simply put, circular debt arises when one party, which doesn't have adequate cash flows to discharge its obligations to its suppliers, withholds payments. When it does so, the problem is transmitted to other entities in the supply chain, each of whom withholds payments, resulting in operational difficulties for all service providers in the sector. As a consequence, none are able to function at full capacity, which, in turn, gives rise to unnecessary power outages.

The circular debt numbers that get reported in the press tend to be the sum of the receivables of each organization, a practice which ends up exaggerating the amount. This is because one party's payables are the other party's receivables; logically, these should cancel out when we subtract one from the other. At the very worst, the net amount should be much smaller. In our case, however, even this net unadjusted amount is growing by Rs. 1.4 billion a day.

Let's refer to this outstanding amount as 'stock'. To be able to understand what this stock represents and its daily build-up, let's look at a simplified and abridged version of the supply chain which results in electricity being provided in our homes.

Refineries provide oil to oil marketing companies. Most of the crude oil is imported and suppliers abroad have to be paid to ensure supply and there can be no debt beyond the terms agreed for the supply of oil. These oil marketing companies sell oil to the IPPs or the WAPDA-owned electricity generation plants (gencos), which produce the electricity and sell it to the government-run distribution companies (DISCOs) such as LESCO, PESCO, etc. which provide power to our homes and factories and bill us for this service.

The tariff (price) at which the gencos sell to the discos and the tariff at which electricity is supplied to the consumers is determined by NEPRA, after governmental approval.

But the first problem arises when the tariff is unable to cover the costs of generating and distributing electricity, which results in the receivables not cancelling out payables (as argued above). For instance, if the price of oil goes up internationally and tariffs are not revised upwards to account for this increase, the government ends up picking up the difference and thereby subsidizing electricity. Currently, the cost of generation at the margin (more than Rs. 18 per unit) is almost two times the average tariff-(less than Rs. 9.50 per unit). This comparison suggests that in order to minimize this 'subsidy', the government would be better advised to have more power outages since every hour of additional generation from imported oil raises the subsidy bill by a larger margin—almost Rs. 9 per unit as against the present average of under Rs. 4 per unit.

This first component of circular debt—the provision of electricity to consumers at rates lower than the cost of generation and distribution—is also a major factor contributing to the growth in size of circular debt. By failing to foot this bill for the subsidy, the government builds-up circular debt.

But there are three other critical components, which raise costs and feed circular debt. First, there are the inefficiencies of government-owned generation and distribution companies; cozy deals struck with providers of rental power plants; overstaffing; free provision of electricity to WAPDA employees (this costs other consumers Rs. 100 million a day); poor maintenance of plant equipment; the use of obsolete technologies (which result in technical losses as well as corruption. All of these simply add—through tariff increases—to the cost of electricity consumers are constrained to bear with equanimity.

Second, there is the widespread issue of electricity theft; the cases of DISCOs in Hyderabad, Peshawar and Quetta are now well-known while no one in FATA pays for electricity.

Finally, there's the issue of poor collection of electricity bills. Federally-managed agencies and provincial governments alone owe more than Rs. 150 billion. Powerful private individuals and companies are also defaulters as are those who, in collusion with WAPDA employees, do not pay but continue to enjoy uninterrupted supply. More than Rs. 220 billion are due from private consumers although a large portion of these alleged "receivables" are dues from fictitious consumers. This category covers theft by consumers, in collusion with the staff of GENCOs, which is parked under convenient heads ranging from non-existing consumers to "unmetered connections" (a category allowed and supported by the staff at GENCOs to facilitate this corruption and which includes agricultural tube wells).

Clearly, the basic issues are failures to a) revise electricity tariffs on a timely basis; b) prevent electricity theft; and c) ensure speedy collection of billing amounts and disconnect supply to defaulters. (The disconnections will actually also reduce the extent of outages.) In other words, the principle issue is that of governance.

So what is the solution? The liabilities in the shape of the remaining inherited 'stock' of Rs. 300-odd billion can be cleared as a one-time effort even—dare I say it—through the printing of money (at the expense of a slightly higher rate of inflation). However, such a step should be made contingent on the taking of firm and clear initiatives that will prevent the build-up of circular debt again. Such a proviso is critical because the prevailing incentive structures enable those operating the sector to live with the comfortable feeling of business as usual (with the same levels of incompetence and poor governance), convinced that the government will simply step forward, yet again, a few months down the road, to bail them out.

It's fairly obvious by now that a key issue is poor governance, reflected in the government's failure to weaken the control of

powerful lobbies who continue to ride this gravy train while the rest of the population wrings its hands helplessly.

The only solution to this issue is to either immediately privatize the management or ownership of DISCOs under an appropriate regulatory framework or to hand them over to the provincial governments. The electricity can be supplied at the provincial borders for the provincial governments to purchase from the GENCOs, thereby relieving Islamabad's overstretched budget from the burden of this seemingly never-ending electricity subsidy.

The adoption of such an approach will also ensure fairness and equity: the 'line losses' (read: theft, with the collusion of staff) of DISCOs in Peshawar, Quetta, and Hyderabad will no longer have to be borne by consumers hooked to the LESCO and FESCO systems which have lower distribution losses.

Even if the provincial governments need to set up physical infrastructure such as grid stations to reduce the distribution losses stemming from technical reasons, this one-time investment is a price worth paying in the short term. And the federal government would do well to finance this investment on behalf of the provinces, even if the money needs to be provided upfront.

Dealing with the immediate problem

The third National Energy Conference was held in Lahore in early April 2012 to take immediate measures to deal with the problem. One decision of the Conference was to distribute the load of the shortfall evenly across the four provinces, reducing the heavier burden on the Punjab. Government offices were to work five days a week, and all markets throughout the country were to close at 8 pm, except on weekends. Other measures were also announced to save electricity, such as cutting power to billboards and replacing regular bulbs with energy savers. To ensure smooth supply of power, additional gas has to be provided to power companies. The Prime Minister said that 700 MW of electricity would be saved by observing a five-day working week. Other measures taken focussed on enforcement and legal issues related to the prosecution of defaulters and electricity thieves.

Longer-term issues

The argument making most of the rounds in Pakistan for some years now, without much progress, is that Pakistan must turn to coal—both from its own large untapped reserves and from imports—to fuel power generation beyond the next decade if it is to ease the energy crisis which has had clear consequences on economic growth. Some experts believe that Pakistan has one of the biggest, barely-touched, single coal reserves on the planet—the massive Thar coalfield in the northern Sindh province with 175 billion tonnes of extremely high water-content, low-energy coal, although it is considered to be uneconomical to exploit. However, rising oil and gas prices; rising coal prices; and new technology to dry out watery, gaseous coal, or leave it in the ground but extract the gas from it instead, have resulted in some projects being initiated around the world. The Pakistan government this year declared the Thar coal fields a Special Economic Zone, with tax breaks and incentives to lure investors to develop coal gasification and mining as part of its strategy to fill the energy gulf.

Some large coal-fired power plants are under construction and more are being converted from fuel oil. Imports of low-grade coal are likely to be part of the near-term solution with the development of Thar a long-term prospect. There are also a few private, coal power plants under construction which will increase the country's need for imports and, once Karachi and Gwadar ports are expanded, larger vessels can be berthed which will make importing more economical.

Other sources of untapped energy are said to be solar (2.4 mn MW estimated by the Alternative Energy Board) and wind (350,000 MW). Clearly, these very exaggerated estimates are just that, and given that the target for producing 1500 MW from wind energy by 2013 is highly ambitious given that only 6 MW is produced from wind, all these numbers are mere speculation. Besides, technology is still very costly. The cheapest form of electricity in Pakistan is hydel, the total installed capacity of which is 6500 MW currently, but some experts believe that Pakistan could produce 50,000 MW from this source. There are issues of water availability and disputes over water-sharing agreements between provinces and India. Nevertheless, the Government of Pakistan has announced that it will build 7 dams producing about 13,000 MW, but the internal politics and financial arrangements of such projects do not permit one to make projections about the completion of such projects. Other sources of importing oil and gas from Iran or Turkmenistan or India, have major diplomatic and security issues, and although the government voices its concern about energy shortfall, there is more talk than solution. The government has added 1,604 MW to the system by commissioning six new independent power producers (1,264 MW) and a nuclear power plant (340 MW). A 49.5 MW wind power plant has recently obtained financing.

Many of the solutions proposed by the government, look cosmetic and have been announced in the past as well. Nevertheless, as in the past, short-term solutions, such as pumping some money into DISCOs to address the circular debt problem to ensure supply, will be found and the problem ameliorated. While this may aggravate the already weak fiscal stance of the government, more serious initiatives will require more substantive measures. Better price incentives, more fiscal resources to invest in power sector initiatives, a more stable political environment to attract FDI, and issues of management and control at the local level, are all required to address Pakistan's energy crisis.

8.7 Summary and Further Reading

8.7.1 Summary

It would surprise most people to know that the small-scale industrial sector of Pakistan has been the backbone of the economic growth and development that has taken place, particularly in the 1980s, and it continues to remain stable, in Pakistan, despite severe crises at a time when the overall manufacturing sector and investment in it, are suffering. In the 1960s, large-scale manufacturing produced high growth rates, but after the intervention in the economy by Bhutto, the small-scale sector grew to prominence. This sector, which has been consciously ignored and neglected by government—ironically, one possible reason for its success—is a major source of employment in the urban areas of Pakistan, and provides as much as 25 per cent of Pakistan's exports. In a situation where overall trends in industry show alarmingly worsening signs, the small-scale sector continues to thrive and show dynamism. However, it must be emphasized that the fortunes of the small-scale sector are closely tied to those of the rest of the economy: if growth falters, as has been the trend in recent years, so too must the small-scale sectors. However, it is very probable that rising remittances into Pakistan, a phenomenon from 2009, might spur up the small-scale sector as well.

The crisis affecting the textile industry has resulted from political interference, poor policies, bad management, and the inability of the industry to adapt to changing world demands and needs. Today, much of the industry is considered 'sick', and thousands of industrial units remain closed. The severe energy crisis since 2009, has made matters far worse.

This chapter, using numerous sources, has tried to show that the public sector has not been a complete failure, as is conventionally believed, and that public sector enterprises have been efficient, productive, and even profitable. The public sector has been much maligned, as is the trend these days, and so there have been growing moves to privatize all things owned by the state. However, privatization is no panacea, as changing ownership need not automatically result in efficiency, or any of the other attributes assumed to be inherent to the private sector. Moreover, the privatization process in Pakistan has been seen as a means to offer political patronage, and for this reason may prove to be counterproductive.

There is a consensus amongst economists in Pakistan that Pakistan's industry has been inefficient, due to high protection and warped incentives. This myth is repeated *ad nauseam* by scholars who have commented on the industrial sector. However, as we have shown, there is now growing awareness amongst a small group of academics that this has not been the case. The claim that industry is inefficient has been overstated, and the evidence presented is misleading, misunderstood, or distorted. Recent work shows that, while numerous problems and hindrances have hampered industrialization in Pakistan, most are of a structural nature, and the causes and claims that are popularly believed are in fact incorrect. Nevertheless, one cannot ignore the fact that between 2008–13, Pakistan's industrial production completely collapsed, with investment at its lowest levels. The government which assumes power after May 2013, will have to address this serious crisis in Pakistan's industrial sector and in its economy—See Appendix 8.4.

8.7.2 Further Reading

In addition to the texts mentioned in Chapters 6 and 7, which cover many of the general issues related to industrialization in Pakistan, including those covered in this chapter, other important and interesting books and papers include:

Nadvi, Khalid, *Employment Creation in Urban Micro-Enterprises in the Manufacturing Sector in Pakistan* (Bangkok: ILO/ARTEP, 1990) which details work on the informal/small-scale sector; Ijaz Nabi's *Entrepreneurs and Markets in Early Industrialization: A Case Study from Pakistan* (San Francisco: International Center for Economic Growth, 1988) and Weiss, Anita, *Culture, Class and Development in Pakistan: The Emergence of an Industrial Bourgeoisie in Pakistan* (Lahore: Vanguard, 1991). Ahmad, M. B. and Robert Laporte's *Public Enterprise in Pakistan: The Hidden Crisis in Economic Development* (Boulder, Colorado: Westview Press, 1989) gives a useful overview of the state-owned industries. The extensive and voluminous study undertaken by the economists at the Lahore University of Management Sciences in 2010, is essential reading for anyone interested in learning about new issues in the industrial sector in Pakistan. See Abid Burki et al. *Industrial Policy, Its Spatial Aspects and Cluster Development in Pakistan: Volume 1, Analysis Report to the Industrial Policy 2010* (Lahore: LUMS, 18 October 2010).

For more details on various aspects of industry, the references provided in the Notes should also be consulted. Newspapers, magazines, and various government publications that are published from time to time should also be reviewed to keep abreast of current issues. The government's Small and Medium Enterprise Development Association (SMEDA), is a good source for information and data, and also publishes reports. See also on privatization: Khan, Akhtar Hasan, *The Impact of Privatization in Pakistan* (Lahore: Ferozsons, 2012).

Appendix 8.1

The History of the Emergence of the Small-Scale Engineering Sector in the Punjab

The small-scale sector, particularly in the Punjab, has changed the face of industry in the province. Khalid Aftab and Eric Rahim tell us how it emerged.

At the time of its establishment in 1947, Pakistan inherited one large engineering enterprise (BECO) under a management with considerable experience in metal working. Besides this enterprise, there were less than ten medium-sized metal working and iron founding units (each employing about 20 workers) in Lahore, Sialkot, Gujranwala, and Wazirabad. In addition, these towns were also centres of considerable small-scale activity in metal working. During the Second World War, Sialkot achieved renown as a centre of manufacture of high quality surgical instruments which were exported to various parts of the Empire. Much of this production of surgical instruments was carried out small scale with fairly extensive subcontracting arrangements. (Sialkot was also famous for sports goods manufacture, again with a substantial small-scale sector.) Wazirabad, a centre of medium and small-scale cutlery manufacture, had the reputation of being West Punjab's Sheffield. Gujranwala was also a well known centre of medium and small-scale metal manufacturing. Finally, there were numerous artisan workshops in various towns catering to the farmer's needs for traditional agricultural implements and producing simple metal products for domestic use.

The indigenous labour force in the western Punjab was augmented at the time of the partition of the subcontinent by an influx from the eastern districts of workers with metal working experience. A majority of the united Punjab's blacksmiths was Muslim. A majority of the labour force in general metal work was also Muslim. Thus, with the 1947 cross-migration of Hindus and Sikhs and Muslims the Pakistan Punjab inherited more than its share of the blacksmith population and metal working labour of the united Punjab. The newcomers together with their indigenous counterparts formed a large reservoir of labour with a metal-working tradition going back many generations. Concentrated in a small number of towns they engaged in diverse metal-working activities either as labourers or as small workshop owners.

These resources formed a modest, but not negligible, base upon which future metal working in the Punjab was to be founded.

Demand from a variety of sources created markets for diesel engines, electric motors, pipes, and water pumps. The most important of these sources was irrigation in agriculture. The severe constraint imposed by water shortage on agricultural expansion was widely noted in the early 1950s. Continuing schemes launched before the partition to extend the use of tube wells, the Agriculture Department of the Punjab government, throughout the 1950s (and the 1960s), provided installation and other facilities to farmers. Although the volume of water delivered by the increasing number of tube wells during the 1950s was small, in absolute terms this development was of considerable importance in spreading the new water technology among farmers.

During the 1950s this expansion remained modest and it was confined to rich farmers in a small number of districts in the Punjab. The really spectacular expansion in demand for tube wells started from 1959–60 when the government of Pakistan's policy towards agriculture, which had suffered neglect during the 1950s, changed radically. The new policy relaxed controls and provided significant incentives for increased production. As a result, the terms of trade between agriculture and industry were improved from the point of view of the farmers who experienced a significant increase in real income. At the same time the volume of loans available to farmers for the purchase of tube wells and other inputs (for example, chemical fertilizers) increased markedly. The farmer thus had the resources to invest in improved means of water supply. He also had a strong incentive to invest because shortage of canal water, particularly at certain critical times in the year, presented a serious obstacle to increased production. After the shift in government policy towards agriculture the farmer's rate of return on investment in a tube well was estimated by one researcher at 100 per cent. Another estimated that on a 50-acre farm in Gujranwala district the cost of a diesel engine tube well was recovered in two years, and of an electric powered water pump in less than one year. Rural electrification in certain districts of the Punjab also exerted a highly favourable influence on the extension of tube well installation. Thus, from 1959–60 there was an explosion in demand for tube wells from private agriculture [from 750 tube wells installed on average annually between 1948 and 1960, to nearly 16,000 each year between 1960 and 1970]. This is also the period when small units in large numbers began to establish themselves in the industry.

. . . The small-scale sector—small production units, artisans, and the reservoir of labour with tradition in metal working—did not initially (early and mid-1950s) have the technical and other resources to respond effectively to the challenge of the expanding tube well market. However, expanding industrial activity during the period offered this sector opportunities appropriate to its resources and skills. For instance, a variety of activities (for example, electric fan making) enabled workshop owners not only to keep their skills alive but also to upgrade them. Expanding operations of large and medium sized enterprises in metal working provided opportunities for employment and acquisition of new skills. Diffusion of skills was also assisted by a number of technical and vocational training centres set up by the central and provincial governments.

Slow-speed diesel engine and centrifugal water pump production was first established in the large-scale sector and it was only gradually that the small-scale obtained the skills, technical knowledge, and physical inputs required to effect entry to the tube well industry. Diffusion of the technology for

production of tube wells proceeded simultaneously with the increasing use of tube wells in private agriculture. . . .

The initiative in producing slow-speed diesel engines and centrifugal pumps on a regular basis was taken by BECO in 1949. It obtained designs of slow-speed diesel engines from a British firm and at the same time imported equipment for their production. In 1952, it set up a joint company with KSB-AG, a West German firm specializing in pumps and turbines. (This partnership ended in 1959 when BECO purchased KSB's share in the joint company and KSB, in collaboration with a number of leading Pakistani business houses, set up a new company in the Punjab.) In the second half of the 1950s, BECO established technical collaboration with overseas—American (turbines), British (electric motors), and German (high-speed diesel engines)—firms. Thus over the decade all or much of the technical know-how required for the production of various types of diesel engines, water pumps, etc. was imported into the Punjab through the medium of BECO.

BECO and other large and medium-sized firms were able to draw on the reservoir of labour with metal-working experience for the manpower required for their expansion. The large and, subsequently, the medium-sized enterprises (in the course of their normal production and under apprenticeship schemes they were obliged by law to operate) trained a substantial number of workers in the production of diesel engines and pumps and, in this way, knowledge of this technology was more widely disseminated. Many of the new small units that entered the industry from 1959-60 were set up by (or in collaboration with) skilled workers who had obtained the necessary experience with one of the larger firms. Many tube well components requiring advanced technology in their manufacture were initially imported, later being locally produced by the large firms. By the late 1950s small units had access to these and other inputs. Some of the medium-sized firms benefitted in a similar way from co-existence with the large firms, they also had access to labour trained, and components and equipment produced, by the large firms. In their turn, when markets began to expand rapidly in the late 1950s, the medium-size firms often found it necessary to give out part of their work to small workshops in the neighbourhood. In this way know-how was passed on to many workshops who later set up their own production.

Appendix 8.2

Helping the Small-Scale Sector: Good Intentions or Stifling Dynamism?

The Panel of Economists created by the Planning Commission of the Government of Pakistan in 2010, came up with a number of solutions in order to capture the dynamism of the small-scale sector, the emphasis of which is government intervention. However, as we have argued, the dynamism of the small-scale sector exists largely because the government does not, or cannot, interfere in how the sector functions.

Inclusive growth through small scale enterprises: the role, constraints, and institutional imperatives

Since small scale industries have higher employment elasticities, smaller Incremental Capital Output Ratios (ICORs), and shorter gestation periods, therefore, an increased share of investment in this sector could enable both a higher GDP growth for given levels of investment as well as higher employment generation for given levels of growth. At the same time if the institutional conditions could be created for enabling small scale industries to move into high value added components for both import substitution in the domestic market and for exports, Pakistan's balance of payments pressures could be eased. The key strategic issue in accelerating the growth of SSEs is to enable them to shift to the high value added, high growth end of the product market. These SSE's include high value added units in light engineering, automotive parts, moulds, dyes, machine tools, and electronics and computer software. . . .

A large number of small scale enterprises (SSEs) in the Punjab and the North Western Frontier Province (NWFP) have a considerable potential for growth and high value added production such as components for engineering goods or components of high quality farm implements for the large scale manufacturing sector. Yet they are in many cases producing low value added items like steel shutters or car exhaust pipes resulting in low profitability, low savings and slow growth.

Constraints to the rapid growth of SSEs

Small scale enterprises in small towns of Pakistan face the following major constraints:

(a) Inability of small units to get vending contracts for the manufacture of components from the large-scale manufacturing sector (LSM), (b) Due to lack of expertise in production management and the frequent inability to achieve quality control it becomes difficult to meet tight delivery schedules. (c) Lack of specific skills like advanced mill work, metal fabrication, precision welding, all of which are needed for producing quality products with low tolerances and precise dimensional control. In other cases accounting and management skills may be inadequate. (d) Difficulty faced by small units in getting good quality raw materials, which often can only be ordered in bulk (for which the small entrepreneurs do not have the working capital), and from distant large cities, (e) Lack of specialized equipment, (e) Absence of fabrication facilities such as forging, heat treatment, and surface treatment which are required for manufacture of high value added products, but are too expensive for any one small unit to set up, (f) Lack of capital for investment and absence of credit facilities.

The institutional framework for overcoming the constraints to the growth of SSEs

Overcoming the aforementioned constraints would involve providing institutional support in terms of credit, quality control management, skill training, and marketing. This could be done by facilitating the establishment of Common Facilities Centres (CFCs) located in the specified growth nodes in selected towns where the entrepreneurial and technical potential as well as markets already exist. Such support institutions (CFCs) while being facilitated by the government and autonomous organizations such as SMEDA can and should be in the private sector and market driven.

The institutional features of CFCs are identified in the ensuing section. The specific technical facilities required for the CFCs, the product groups they could serve and the geographic locations of enterprise clusters are given in the Appendix-VI of this Report.

The specific institutional features of CFCs

The concept of the Common Facilities Centers is based on the fact that small-scale industrialists in Pakistan have already demonstrated a high degree of entrepreneurship, innovation, and efficient utilization of capital. The CFCs would provide an opportunity for rapid growth to SSEs through local participation in extension services, prototype development, and diffusion of improved technologies, equipment, and management procedures.

Each of the CFCs would be designed to serve a cluster of products/process related enterprises. Each cluster of enterprises could be aggregated into a corporate entity which would jointly own the CFC, with each enterprise contributing equity to the CFC.

Each CFC would constitute a decentralized hub for the SSE cluster for ensuring continuous easy access to a comprehensive package of support services such as: (i) product development, (ii) technical services, (iii) skill training, (iv) quality control systems, (v) managerial advice, (vi) purchase of high quality raw materials, (vii) marketing, (viii) institutional link up with large scale enterprises to supply them with outsourced products and components (ix) The CFCs could also perform the role of financial intermediation with the banking system and enable individual SSEs to access credit.

The CFCs could also be linked up with national research centres, such as the PCSIR and donor agencies for drawing upon technical expertise and financial resources of these agencies in the service of small scale industrial enterprises (SSEs). In this context it is advisable to establish institutional links between the research centres within Pakistan such as the PCSIR and Pakistan's manufacturing sector in general and small industries in particular. It is important to translate science research into products, processes and technological change that is market driven and required by the small scale in the small scale sector. Of particular relevance is the need to re-orient the link between the PCSIR and industry to enable certification of products and quality standards for exportables.

Organizational features and functions of CFCs

The Common Facilities Centres could have the following functional dimensions:

(i) Marketing

Provision of orders from the large-scale manufacturing sector for components, and from farmers for farm implements. These orders would then be subcontracted to the cluster of SSI units that the CFC is supposed to serve. The individual order would be subcontracted to the SSI on the basis of the skills and potential strengths of the unit concerned.

(ii) Monitoring and Quality Control

Having given the subcontract, the CFC would then monitor the units closely and help pinpoint and overcome unit specific bottlenecks to ensure timely delivery and quality control of the manufactured products. These bottlenecks may be specialized skills, equipment, good quality raw material, or credit.

(iii) Skill Training and Product Development

Skill training for technicians could be provided by the new good quality vocational training institutes (VTIs) established by the Vocational Training Council of Punjab. Similar VTIs could be established in other provinces. The CFC would provide specialized supplementary skill training on its premises to workers in the satellite SSI units when required. At the same time, it would provide advice on jigs, fixtures, special tools, and product development where required.

(iv) Forging and Heat Treatment Facilities

The CFCs would establish at their premises plants for forging, heat treatment, and surface treatment. The SSI units could come to the CFC to get such fabrication done on the products they are manufacturing on subcontract, and pay a mutually agreed price for this job to the CFC.

(v) Credit

The CFC would provide credit to the SSEs for purchase of new equipment and raw materials. In cases where raw materials are available in bulk supply, the CFC could buy it from the source, stock it on its premises, and sell at a reasonable price to units as and when they need them.

Final Report of the Panel of Economists, *Medium Term Development Imperatives and Strategy for Pakistan*, (Islamabad: Planning Commission, Government of Pakistan, April 2010), 98–101.

Appendix 8.3

Privatization and the Energy Crisis

Kamal Munir and Salman Khalid traced the genesis of Pakistan's severe energy crisis after the mid-2000s, and particularly after 2008, in the privatization policies two decades ago.

> In recent months, the Pakistan government has come under tremendous pressure to fix the dire energy situation. Entire cities plummet into darkness for up to 12 hours a day, and industry has come to a grinding halt. The government responds with making false promises and holding "energy summits" that invariably come to nothing. The blame is always put on the people who are deemed to have gotten used to "subsidies" and the non-bill-payers. What no one seems to question is the policy shift that has led to a situation where people are deprived of energy despite excess capacity in the system, and yet this is where the problem lies. This article attempts to explain how this situation has arisen.

Private power

It was in the midst of much hype that Pakistan launched the privatization of its power sector. The initiative was based on the 1994 private power policy, whose main contours were almost entirely defined by the World Bank which had long been pushing for opening the sector to private investment through generous incentives. The policy and the deals that were struck under it were lauded universally by private financiers as well as by most development institutions. The policy was even lauded by the then United States Secretary of Energy, Hazel O'Leary, who described it as 'the best energy policy in the whole world'. O'Leary's mission to Pakistan was lauded in the US Congress in these terms: "Energy Secretary Hazel O'Leary has just returned from a highly successful mission to Pakistan, which has opened new doors to American business leaders and may represent as well an important turning point in our diplomatic relationship with Pakistan". O'Leary was accompanied by 80 American business executives, primarily from the energy sector. The O'Leary trip resulted in the signing of 16 contracts worth nearly $4 billion.

The 1994 power policy was essentially based on the structure evolved for the Hub Power Project (or HUBCO), a 1,292 MW, $1.6 billion project that was celebrated widely amongst global investors. Euro money Institutional Investor first hailed the deal as "Deal of the Year", and later as "Deal of the Decade". The acclaim that this deal received meant that Pakistan had unprecedented interest from investors and had before long contracted another 19 independent power producers (IPPs) to contribute another 3,400 MW. Pakistan was advertised by the World Bank and global investors as the gold standard for privatization of the energy sector.

The deal

The policy separated generation of electricity from its transmission and distribution. Going forward, a vast majority of the new generation capacity was to be the domain of private investors who were offered a bulk tariff of US cents 6.5/kWh for sale of electricity to the still state-owned transmission and distribution companies.

Investors were to be provided a $-based internal rate of return of 15%–18% over the 25–30 years period of the power purchase agreement (however, in HUBCO's case 18% was initially agreed) after covering for operational costs, backed by sovereign guarantees of the Government of Pakistan. The IPPs could be built using up to 80:20 debt-equity ratios, although most opted for a 75:25 debt-equity ratio.

The IPPs were to be paid every month in two parts, i e. capacity payment and energy payment. The capacity payment reimbursed the IPP for all fixed costs of the power plant including debt servicing (remember the 80:20 debt-equity ratio) and provided the investor's equity return on top. These payments were to be made irrespective of whether the IPP was asked to produce electricity or not. Second, this stipulation made sure that the off-taker Water and Power Development Authority (WAPDA)/ Pakistan Electric Power Company (PEPCO)/Karachi Electric Supply Company (KESC) became contractually liable for repaying the debt (and its interest payments) taken to finance 80% of the project cost anyway.

The energy payment reimbursed the IPP for all variable costs of production (e.g. fuel costs) regardless of the type of fuel employed and its market price. All payments were indexed (if relevant) with US$/Pakistan Rs. exchange rate and inflation (local or foreign) changes. Thus, if the fixed foreign Operational and Maintenance (O&M) cost of $1/kWh is to be paid in year 1 and $1 is equivalent to Rs. 60, then the IPP was paid Rs. 60/kWh for that fixed foreign O&M component in year 1. However, if in year 2, the rupee devalued to Rs. 80 and US inflation was 2% then the IPP was paid Rs. 81.6/kWh ($1.02 multiplied by Rs. 80).

Finally, private producers were given an exemption from corporate income tax, customs duties, sales tax, and other surcharges on imported equipment. Among other incentives was permission for power generation companies to issue corporate bonds and shares at discounted prices.

The gold rush

Not surprisingly, investors rushed to invest in Pakistan's power sector and overwhelmingly set up oil-based, inefficient, single cycle power plants. Twenty IPPs (including HUBCO) reached financial closure with a combined capacity of 4,500 MW (four projects with a combined capacity of 435 MW were later terminated) and brought in a total investment of $5.3 billion, of which 25% was financed by foreign equity. It should be noted that the total predicted shortfall for which all this private investment was being brought in was only 1,500 MW! The World Bank however claims that it had advised the Government of Pakistan to contract only 2,000 MW. In any case, WAPDA was stuck with massive overcapacity for which it was contractually obligated to pay irrespective of whether it needed those IPPs to produce electricity or not.

Many thought that it would be much cheaper to follow the traditional approach of getting soft loans as a sovereign and building the power plant with WAPDA's expertise as much of the country's power infrastructure had been built that way since 1947. However, sources close to the HUBCO deal reveal that by the mid-1980s, the World Bank had indicated that soft loans would no longer be extended and the Bank would only support

international investment in Pakistan's power sector if private investment was brought in through the IPP model.

The keenness of the Bank to usher in privatization can also be gauged by the fact that it was involved in almost 88% of the total IPP capacity contracted (3,400 MW) through equity, loans, or other guarantees.

When the lights came back on

The privatization juggernaut rolled on through the 1990s. Capacity in the system increased to first meet whatever the forecast shortfall had been (this kept moving upward), and kept increasing. It took a few years for the true extent of this policy's fallout to become apparent. When lights came back on, the power sector and everything else that depended on it lay in ruins. All the promises of great service vanished. Since 1990, tariffs in rupee terms have climbed up approximately 530% for the median domestic consumer (while doubling in dollar terms) as the energy mix of the country shifted away from much cheaper hydro to thermal (read oil) based power, exposing the average consumer to the vagaries of the international oil price fluctuations. As a result, the government and the consumers found it increasingly difficult, almost impossible, to pay for this electricity. By 2011, it became usual for large parts of the country to plunge into darkness on a daily basis—all this in the presence of substantial excess, unused capacity!

In the lead up to privatization, the World Bank had provided at least three justifications for this move from public to private provision of energy. First, it claimed that the current level of service that was being provided to consumers was below par. Line losses were high and disruptions were frequent. Second, by subsidizing power production, governments were coming under increased financial strain. Facts and figures were provided to show how current expenditure on health and education were insufficient and how privatization of the energy sector would improve the government's fiscal position and free up public funds for these important causes. Finally, it was suggested that the existing subsidies were not helping the poor in any case since most of them were not connected to the grids. Thus taking away the subsidies would actually hurt the rich more than the poor.

A decade later, none of those "savings" have been allocated to healthcare and education as promised. In fact, in those sectors too, privatization has been constantly encouraged. As a result of power shortages, industry, commerce, and agriculture have been taking serious hits with the country's growth prospects dimming significantly. At the same time, residential consumers have had to endure over 8–12 hour blackouts in major cities of the country with the situation even worse in rural Pakistan.

As for improving the government's fiscal position and easing financial strain, the power policy led to a crippling of government finances through the "circular debt"—a debt that accumulated in the system because of increasing oil prices (nearly 70% of the total capacity was now based on oil-fuelled thermal units generally of low efficiency), and the consequent inability of the government to continue compensating the IPPs for fixed and variable contracted amounts. Meanwhile, the total energy produced in the country actually decreased nearly 10% between 2007 and 2010.

When the country started out on the road to privatization, its electricity generation relied on a fuel mix heavily in favour of hydro as opposed to thermal. This has now changed dramatically over the following decade with the fuel mix changing to 30% hydro and almost 70% thermal by the end of 2010. Given that Pakistan imports all of its oil and has scarce gas reserves, that the oil prices climbed to $140/barrel in this period, and combined with the fact that the much-lauded 1994 policy did not discriminate on the fuel source being employed, the consequences for Pakistan's "fiscal position" are there for all to see.

Paying the cost

The cost of this strategic policy level folly can be understood with the following comparison. As per the National Power System Expansion Plan 2010–2030 of the National Transmission and Dispatch Company (NTDC), as of 2010, WAPDA (employing hydro production) generated electricity at Rs. 1.03/kWh (1.2 cents/kWh) while public sector thermal power plants provided the same at Rs. 8.5/kWh (10 cents/kWh). However, the IPPs (primarily thermal) provided the same at Rs. 9.58/kWh (11.2 cents/kWh). As a result, the average blended cost of generation was Rs. 6.6/kWh (7.7 cents/kWh) in 2010 which further increased to Rs. 9.81/kWh (11.5 cents/kWh) for the end consumer due to line losses and theft in the transmission and distribution systems.

Even after adjusting for debt repayment, power production through indigenous hydro resources comes out much better. The estimated cost of energy from a majority of potential new hydro projects is expected to come under 4.5 cents/kWh according to a recent NTDC report. Moreover, the country has so far completely failed to develop its coal reserves (only 30 MW comes from coal) which are estimated at 175 billion tonnes (the second largest in the world). Engro Corporation, which owns a block of coal in Thar, estimates a tariff of 10–12 cents/kWh for Thar coal-based power production based on the current policy. The world average for coal-based power production in the energy mix is 40% while it is only 0.1% in Pakistan.

Incredibly, most policymakers continue to blame non-bill-payers, line losses (which are adjusted in the cost of production!) and subsidies for this situation. The solution they propose is to switch off lights in a country which already boasts one of the lowest per capita electricity consumption in the world. Similarly, they keep increasing prices to supposedly meet the "true" cost of production, when the problem lies with the cost, not the price! Because of the 1994 and later 2002 power policy, the cost is several times higher than it would have been otherwise. By choosing to buy power at exorbitant rates from IPPs the government is burdening the people, not subsidizing them! As for foreign investment, because of this policy, for the sake of the 25% equity (say $25 million for a 100 MW plant) which the IPP investors typically bring in, the government ends up spending approximately $83 million (in equity returns and debt financing costs) more through the life of a 100 MW thermal IPP!

The blackout in Pakistan is a policy failure, a result of the disastrous privatization undertaken by the government at the behest of the World Bank. Blaming petty theft, line losses, or subsidies is only going to create a bigger hole for the government. The only way to reverse this dire situation, which is crippling industry and plunging homes into darkness, is to reverse the 1994 policy. But for that to happen someone will first need to admit failure. Unfortunately, that possibility looks remote for the time being.

Appendix 8.4

Pakistan's Sagging Manufacturing Sector

It was not just 2010/11 or 2011/12 which were noticeably bad for Pakistan's manufacturing industry due to the energy crisis. This article by Nasir Jamal as early as 2008, underlined the growing malaise in Pakistan's industrial sector.

Acute energy shortages, high costs of production, sluggish domestic economy, and reduction in global demand are beginning to take their toll on the manufacturing sector. The country's industrial output, says the Federal Bureau of Statistics, fell by 6.2 per cent in the first quarter (July-September) of the current fiscal year [2007/8]. The numbers released for the first quarter of the year underscore that the large-scale manufacturing had under-performed, dampening hopes of meeting the annual target of 6.1 per cent growth in the large-scale industry.

The industrial growth has been declining for three years now. It dropped to just 5.4 per cent during the previous year from under 20 per cent in 2004-05 due to capacity constraints and high cost of doing business. The FBS figures show that the production of cotton yarn declined by 0.55 per cent, cotton cloth 0.88 per cent and powerlooms by 64.42 per cent. In the electrical sector, production of refrigerators declined by 1.6 per cent, deep-freezers 29.22 per cent, air-conditioners 22.55 per cent and TV sets 10.83 per cent. Iron and steel production declined by 1.5 per cent, pig iron 11 per cent, billets 39.26 per cent and HR sheets 22 per cent. Production of vegetable ghee dropped by 12.49 per cent and cooking oil 8.55 per cent. Production of buses declined by 41.25 per cent, jeeps and cars 47.16 per cent, and motorcycles 8.49 per cent.

'The slowdown in the industrial output was inevitable because of the cut in industrial productivity due to six to eight hours' power shutdown a-day,' Abid Farooq, former chairman of the All Pakistan Textile Mills Association (APTMA), told Dawn last week.

Hours before the Sui Northern Gas Pipeline Company, the state-owned utility, had cut off supply to 70 industrial units on Lahore-Faisalabad Road owing to what its officials said the growing demand of domestic consumers, adding to their concerns about timely shipments of their export orders. 'Most units deprived of gas supply are export-oriented textile mills. Now we hear that the utility is going to suspend supply to cement and other plants also,' he said. 'This is happening when winter has just set in. You can well imagine what treatment will be meted out to the industry in the next two months when winter will be at its peak,' he said.

Exports of manufactured goods have grown marginally in dollar value to $4.98 billion during the first four months of the current year to October from $4.52 billion last year. Textile and cotton exports have grown to $3.64 billion from $3.52 billion. Exports of other manufactured goods increased to $1.34 billion from just above $1 billion. But the manufacturers and exporters warn that full impact of the energy shortages and other negative factors on the economy will be felt in the months to come. 'True, there's a marginal rise in textile exports. But look at the industry's potential. Energy problems and spiking cost of doing business are not letting us take advantage of our potential,' argued Mr Abid.

Energy shortages are affecting smaller manufacturers more than large-scale industries. 'A number of small units have closed down in recent months because they did not have and could not arrange alternative power supply due to financial costs,' a Small and Medium Enterprise Development Authority official, who asked not to be named because he wasn't authorized to speak publicly, said. He said everyone—sanitaryware producers, fan manufacturers, sports goods exporters, auto vendors, and so on, were facing serious problems due to power cuts.

'Some have shut down their manufacturing and others laid their workers off,' he said. But he did not have the exact number of workers thrown out of job because there is no state or private institution to maintain such record in the formal or informal sectors. 'If energy shortages are causing reduction in output, the security situation is scaring foreign buyers away. The buyers are reluctant to visit us due to travel advisories. Our foreign buyers feel more comfortable in visiting and dealing with Indians, Bangladeshis, and Vietnamese because of security concerns in Pakistan,' M. I. Khurram, leading knitwear exporter, contended.

On top of that, he argued, Pakistan had become unattractive for the buyers due to rising cost of business. 'Pakistan is not a preferred destination for the American or European retail chains. We get only spillover orders,' said Khurram. 'So the reduction in industrial output should not surprise anyone in the given circumstances,' he said. The productivity as well as exports of manufacturing sector would suffer in the months to come, he added. The increasing prices of electricity and gas and spiking credit cost are blamed for the escalation in the cost of doing business and making the industry unviable.

'The growth in the cost of doing business has eroded the positive impact of currency devaluation. We are losing in the global markets despite the above 21 per cent currency depreciation,' he said. Former Lahore Chamber of Commerce and Industry president Pervaiz Hanif says the persisting economic and exchange rate instability is keeping exporters from quoting prices

for six-month orders. 'It is a difficult situation. If we undercut prices offered by our regional competitor, energy problems, exchange rate volatility, escalating inflation, etc. make the entire economic situation and exports quite untenable,' he said. Mr Khurram said the economic difficulties facing the manufacturing sector were exacerbated by the slowdown in the domestic and global sectors. 'I fear massive job loss and drop in output in the next few months.' The cost of production in the industrial sector has increased mainly because of the rising utility bills and interest rates.

The escalating cost of credit has caused fresh investment in industrial manufacturing to dry up in the last two years, increasing supply side constraints. 'There has been no significant investment in the industrial sector in the last couple of years to increase productivity,' said Abid. 'People have invested only where it was necessary to keep operations going. It is not possible to set up new industry at 22 per cent interest rate,' he added.

As most medium to large scale manufacturers somehow managed to absorb the recent hike in energy price and financial charges, they are finding it difficult to cope with power and gas cuts. 'It is a double whammy for the industry: on the one hand it raises our cost of production and on the other it results in sharp decline in our revenues,' Mr Abid said. 'And this is happening for no fault of ours.' In the given situation, he said, it had become extremely difficult for entrepreneurs to service their debts. 'The government must intervene to save manufacturers from defaulting on their loans by instructing them to delay recovery of their loans till the energy crisis is taken care of and the industry is able to operate to its full capacity,' he demanded.

Notes

1. There are definition problems in trying to identify the informal sector and what sort of activity forms part of it. The small-scale sector is also a badly defined term, especially in Pakistan, where it constitutes units 'not registered' under the Industries Act. Size is also a factor, where the informal manufacturing sector consists of those unregistered manufacturing units that employ fewer than ten persons. Moreover, the informal sector and the small-scale sector are not the same thing, although they are used here interchangeably for our purposes. See Nadvi, Khalid, *Employment Creation in Urban Micro-Enterprises in the Manufacturing Sector in Pakistan* (Bangkok: ILO/ARTEP,1990), and Alvi, Imtiaz, *The Informal Sector in Urban Economy: Low Income Housing in Lahore* (Karachi: Oxford University Press, 1997) for an extensive discussion of what the informal and small-scale sectors are.

9 Balance of Payments and Trade Regimes

The previous three chapters on the industrialization process in Pakistan and on the issues which have subsequently emerged as a consequence show that perhaps the most critical factor to affect industrialization has been the trade regime. The import substituting industrialization of the 1950s and 1960s, the non-devaluation decision in 1948, the export-led Korean War boom, the high tariffs and protection given to domestic industry in the 1960s, the devaluation decision of the Bhutto government in 1972 with its serious repercussions for the economy, the decision by the Zia regime to delink the rupee from the dollar, and all other issues related to trade and the exchange rate have, historically, had numerous consequences for the rest of the economy, and especially for the industrialization process. The trade regime in Pakistan was held responsible for gross inefficiencies in the industrial structure towards the end of the 1960s, allegations which later helped to develop a new liberal orthodoxy with respect to trade policy. The Structural Adjustment Programmes agreed to by the Pakistan governments since 1988 include trade sector reform as a major plank in the strategy. The trade regime since then has seen drastic changes in its composition and will continue to affect the way industry develops. Moreover, given the fact that the taxes raised from imports used to constitute more than half of total government revenue, changes in the tariff structure have had a significant effect on revenue generated by the government. For all these reasons, the importance of trade policy must be realized as it plays a critical role in the nature of developments within the country. And now, with globalization an unstoppable process and with the World Trade Organization (WTO) laying down the rules for trade, this new global trade and economic order will affect all countries, including Pakistan, in fundamental ways.

This chapter examines how trade policy and the changing trade regimes over the years have influenced the course of development, particularly industrialization, in Pakistan. It will also analyse how Pakistan's trade process and pattern have evolved over the last sixty-six years, where, from producing and exporting agricultural primary commodities in 1947, Pakistan today exports mainly manufactured and semi-manufactured goods. There have been many more changes in the direction of trade, the management of the exchange rate, tariffs, etc. All these factors are discussed in the sections that follow. The first section provides information about the basic structure and nature of different aspects of Pakistan's balance of payments and trade, as has been the practice in chapters which deal with large amounts of data. Subsequent sections in this chapter then, address specific issues and debates regarding trade and its impact on the economy.

9.1 Pakistan's Foreign Trade: Basic Facts

The pattern and nature of foreign trade gives a fairly good indication of the pattern and nature of the economies that enter into trade relationships. Those countries with comparative advantage in certain products are likely to produce and export those commodities. Often, they will need to import raw materials for their exports, establishing a strong link between the two. Countries that are dependent on climatic conditions for their exportable agricultural products may have to contend with output being determined by the vagaries of the weather. Single commodity exporting countries must frequently contend with changes in world demand, which can play havoc with any long-term strategy to industrialize or develop, based on foreign exchange earnings (see Box 9.1). Over time, the pattern of trade often changes, as countries move from exporting primary products to finished manufactured goods, and their imports change from consumer goods to machinery. Pakistan's foreign trade pattern follows such a sequence and this section examines that change.

In 1948/9, 99 per cent of Pakistan's export earnings were made up of just five primary commodities: raw jute, raw cotton, raw wool, hides, and tea. Pakistan fits the classical case of an unindustrialized and undeveloped country, in the early years producing and exporting only primary products and mainly dependent on adequate climatic conditions. A change began to occur early in the pattern of exports, as Pakistan's economic policies shifted towards an emphasis on industrialization (see Chapter 6). By 1951/2, the five main primary commodities contributed 93 per cent of export earnings, which by 1958/9 had fallen to 75 per cent. Pakistan's main imports in the first decade were consumer goods, cotton textiles, and cotton yarn. In these years, the direction of trade also changed: in 1948/9 India's share in exports was close to 56 per cent, but this had fallen to only 4.1 per cent a decade later. Dependence on India for imports was also reduced in this period. The main trading partners of Pakistan in the early years, not surprisingly, were the developed countries of the West, mainly the UK, the USA, Germany, Belgium, Italy, and Japan.[1]

Box 9.1

The Objectives and Tools of Commercial Policy

Viqar Ahmed and Rashid Amjad show how commercial policy and the management of foreign trade take place:

> Foreign trade management has a special significance for policymakers in developing countries since it provides opportunities to stimulate the growth process. Even if production relations are given, foreign trade offers the policymakers choices between import and local production, and export and domestic consumption, leading to a more efficient allocation of resources. Foreign trade can also transform the existing production relations by providing opportunities to remove domestic shortages of scarce factors of production, to overcome the diseconomies of the small size of the domestic market, and to exchange goods with less growth potential (for example, raw materials) with goods having more growth potential (for example, technical know-how and equipment). Commercial policy is the art of managing the exchange of goods and services between countries.
>
> In a typical developing country, particularly in the early stages of development, the bulk of exports consists of primary commodities and export earnings due to the relative inelasticity of supply, and production levels of primary goods are not only unpredictable but also vulnerable to a number of factors. The developing country also depends upon the advanced industrial countries for most of its developmental needs (technology, capital, and producer goods) and consumption requirements. The developing countries, therefore, find their external environment difficult as their terms of trade deteriorate, their access to the markets of the advanced countries is limited by tariff and non-tariff barriers, and the trade and payments gaps widen with the passage of time.
>
> The only short-term solution available to them is to seek extensive external assistance which, in due course, creates its own complications.
>
> Within the context of the compulsions of economic development, commercial policy in developing countries may pursue the following objectives:
>
> **i)** Maintaining equilibrium in the balance of payments and balance of trade, or at least limiting the extent of disequilibrium;
> **ii)** Attaining favourable terms of trade so that, with the same quantity of exports, the country is able to import greater quantities of goods and services and thus achieve a net addition to real income;
> **iii)** Promoting exports to derive the full benefits of comparative advantages and also to finance the country's import requirements;
> **iv)** Import substitution to protect domestic production, accelerate the rate of capital formation, create employment opportunities, narrow trade and payments gaps, and seek a certain degree of national self-sufficiency;
> **v)** Ensuring adequate availability of imported goods for both development and other purposes;
> **vi)** Keeping the internal and external values of the national currency at desired levels.
>
> Governments usually have a wide range of instruments of commercial policy to achieve policy goals. The most commonly used tool is the tariff structure consisting of import and export duties. Import duties can be used to influence the relative profitability of importing various commodity groups (for example, taxing development imports at lower rates than non-development imports), and to restrict the access of certain commodities to the domestic market in order to encourage savings and investment. Export duties may be used to limit the export of commodities in short supply at home and also sometimes to fill the gap between low domestic prices and high world prices.
>
> Non-tariff measures may be divided into direct and indirect trade restrictions. Direct measures comprise embargoes on the import or export of certain commodities or quota restrictions which are often specific to certain commodities, destinations, or currencies. The imposition of exchange control and the licensing of imports and exports, common in developing countries, also constitute direct trade restrictions. Licences may be issued for the import of certain commodities without much formality and with no restrictions on quantity or source. In Pakistan this is known as the Open General License (OGL) system. But for most imports, a proper licensing system is introduced which may restrict the importer to make purchases from a specific country or currency area.
>
> Indirect trade restrictions include various incentives and disincentives designed to influence the flow of foreign trade or its composition, such as a) raising or lowering margin requirements for letters of credit to import certain commodities or categories, b) fiscal incentives for industries using domestic materials aimed at reducing the demand for imported substitutes, and c) subsidies and credit concessions or priorities of certain import-replacing goods or exportable. A special tool, often used by developing countries but regarded unfavourably by international monetary and lending institutions, is the multiple exchange rate system. This seeks to maintain a high external value of the national currency in order to export goods with greater competitive advantage in the world market while importing high-priority commodities, and to maintain a low external value to export goods with lesser advantage and to import low-priority commodities.

Source: Ahmed, Viqar and Rashid Amjad, *The Management of Pakistan's Economy, 1947–82* (Karachi: Oxford University Press, 1984), 241–2.

In the Decade of Development under Ayub Khan, as industry was further established and the nature of production changed, so did that of trade. In the first decade, most of Pakistan's trade had been with the developed, industrialized countries, since they produced commodities that Pakistan needed at that time. As more and more countries began to develop and industrialize, their demands and needs for foreign goods also changed. For Pakistan this meant the diversification of both export and import markets. Pakistan began to sell its exports outside the developed countries, while the developed countries now also had a choice to buy goods from other sources.

The pattern of trade took on a different story after 1971, when Bangladesh was created, for the contribution of East Pakistan in Pakistan's trade and foreign exchange had been quite substantial (see Box 9.2). Tables 9.1 to 9.3 give the basic features of the trade regime following 1971. Table 9.1 is a summary of the balance of payments, showing the main categories of earnings and expenditure related to trade. The trade balance, which is the difference between exports and imports, has for the most part been in the negative, implying that imports have been greater than exports. The current account deficit is an important statistic composed of the balance of trade and the flow of income through invisibles, such as tourism, banking services, and insurance. In Pakistan's case, the most important contribution to the balance of payments has been workers' remittances, mainly from the Middle East. In fact, for many years Pakistan's trade and economy have been highly dependent on money from the Gulf. The rest of Table 9.1 shows the contribution of foreign investment in Pakistan, and loans and aid made by donors to the country.

Table 9.2 is a more detailed table, showing Pakistan's exports and imports from 1950 to the most recent statistics. Pakistan's trade (exports plus imports) has expanded from US$759 million in 1950/1 to $68 billion in 2011/12, an increase of about 90 times. However, this figure can be a little misleading due to inflationary trends. If we examine the constant prices for trade, the 1950/1 figure was Rs. 2.9 billion, rising to Rs. 17.11 billion in 1994/5, a rise of less than six-fold. Hence in real terms, the expansion in Pakistan's trade has been less than what current prices may suggest. One of the most interesting statistics from Table 9.2 is that for the balance of trade. Except for 1950/1 and 1972/3, the balance of trade has been negative, implying that Pakistan always imports more than it exports.

The growth rates in key balance of payments components are shown in Table 9.3. One can see a fairly haphazard pattern for exports and imports from this table. The current account deficit has shown some huge fluctuations over the

Box 9.2

East Pakistan's Contribution to Trade

In 1948/9, 99 per cent of United Pakistan's foreign trade comprised of five primary commodities: raw jute, raw cotton, raw wool, hides and skins, and tea.[1] All the raw jute and tea exported came from East Pakistan. In 1951/2, 51 per cent of United Pakistan's exports were constituted by tea and raw jute alone. In 1969/70, just raw jute and jute-related manufactured products originating from East Pakistan were providing more than 47 per cent of Pakistan's total exports.[2] In 1969/70, East Pakistan was a large market for West Pakistan, absorbing 50 per cent of the West's exports, while the East wing provided 18 per cent of (West) Pakistan's total inputs for that year.

[Table 1] shows that while East Pakistan was exporting goods worth more than West Pakistan, the western wing of the country was using these proceeds to import goods into West Pakistan, far in excess of its share in exports. As the table shows, East Pakistan usually had a surplus trade balance, while West Pakistan had a huge trade deficit in all the seven years between 1960 and 1967. Hence this evidence suggests that West Pakistan was living off the exports of East Pakistan.

P = Provisional

last forty years, more than doubling from the previous year in 1983/4, 1987/8, and 1992/3. These variations from one year to another need to be seen in light of the whole economy. Hence, Table 9.4 shows how some of these constituents of the balance of payments have changed with respect to GDP. Exports have shown a healthy trend as their share of the GDP has increased since 1980/1, while that of imports has fallen. The trade deficit has also been brought down to manageable levels, but workers' remittances have fallen by one-third compared to the huge contribution of 10 per cent of GDP they made in 1981/2 except following the events of 9/11, in 2002—see Chapter 18. The current account deficit is one of the more important indicators for the whole of the economy and has stayed on the high side, at a level which is considered to be unsustainable. Less than 3 per cent of GDP, implying that there is not too great a difference between imports and exports of all kinds, is considered a reasonable level for a country developing in the direction and at the rate of Pakistan.

Table 9.5 and Figure 9.1 show how drastically the composition of exports and imports have changed. Primary commodities, which were 99 per cent of exports in 1948/9, fell to 45 per cent in 1971/2, and were a mere 11 per cent in 1994/5, but have risen again in more recent years. Similarly, manufactured goods now contribute 70 per cent of exports, having fallen from as much as 79 per cent of Pakistan's exports in 2004/5. (However, these figures do not reveal a very important aspect of the nature of manufactured exports which is discussed below). Regarding imports, capital goods, such as machinery, and industrial raw materials have replaced consumer goods as the main imported item. In 2012, industrial raw materials constituted more than three-quarters of imports, and manufactured exports constituted 70 per cent, down from 79 per cent in 2004/05.

Tables 9.6, 9.7, and 9.8 show the composition of trade in somewhat greater detail, revealing the brittle nature of Pakistan's exports. Although 75 per cent of exports are supposed to be manufactured items, in 2002/3 as much as 70 per cent of Pakistan's exports (Table 9.8) were dependent on a single commodity, i.e. cotton. Raw cotton, cotton yarn, textiles, fabrics, cotton made-ups, garments, etc. have their source in cotton; in 2012, this figure had changed little. Rice, vegetables and fruit, which formed about 8.6 per cent of exports in 2011/12 are also agricultural commodities. Hence,

while in 1948/9 Pakistan exported mainly unprocessed raw primary products, sixty-six years later, exports continued to be dependent on agricultural commodities and on the weather, which can have serious effects on the level of exports.

The data for imports shows that not only does Pakistan import a great deal of machinery and capital goods; it has also imported wheat and cotton, two products in which Pakistan should have achieved self-sufficiency many years ago. Almost 4 per cent of Pakistan's imports were for wheat in 1994/5 when 2.6 million tons were imported. Animal and vegetable oils and fats used for making cooking oil contributed more than 10 per cent of Pakistan's imports in 1994/5.

Table 9.9 is revealing of the direction that Pakistan's trade has taken over the last twenty or so years. While the United States is still Pakistan's main export market—a fact that also has political overtones as discussed in Chapter 25—and was Pakistan's major trading partner for many years, its share has fallen since 1973/4. China is now Pakistan's main non-oil importing trading partner, a picture which is mirrored in most countries of the world. Moreover, after 9/11, Afghanistan has now emerged as one of Pakistan's main export markets. The rise of the Middle East as a major importer of Pakistani products after 1975 and as a source

for Pakistan's imports, mainly of petroleum, is also seen in the table. Kuwait, for example, provided almost 10 per cent of Pakistan's total imports in 2010/11, all of which was oil. However, Kuwait imports very little from Pakistan. The case of Saudi Arabia is more stark, where Saudi Arabia provides Pakistan oil and nothing else, and imports very little from Pakistan in exchange. This is also the case with Malaysia, where trade with Pakistan is mainly in one direction. Malaysia provides Pakistan primarily with palm oil for the manufacture of edible oil and ghee, but Pakistan exports next to nothing to Malaysia in comparison. This pattern is reversed for Hong Kong, which used to import mostly cotton yarn, while Pakistan imported very little in return. Although there has been some diversification in the direction of Pakistan's trade since the 1970s, even by 1994/5 only four countries—the USA, the UK, Germany, and Japan—constituted more than 30 per cent of Pakistan's trade. In 2010/11, this pattern had changed, and now China is Pakistan's main non-oil producing trading partner, followed by the USA, Singapore, and Germany. However, If we include oil imports as well, then Pakistan's biggest trading partner is the UAE, followed by Saudi Arabia and Kuwait. The surprise in trade direction has been the rise of Afghanistan as Pakistan's second biggest export market, after the US, even larger than the UAE.

One of the most important features of Pakistan's economy in recent years, and particularly since 2002/3, has been the contribution made by workers' remittances. Rising to 10 per cent of GDP in 1982/3, to a value of about $3 billion, they then decreased substantially, although they still contributed 3 per cent of GDP or $1.86 billion in 1994/5. The fact that Pakistan received more than $4.2 billion in 2002/3, equivalent to 15 per cent of GDP, was indeed astonishing (see Table 9.10). This issue is discussed further in Chapter 18 where we examine the very special and specific circumstances which gave rise to this phenomenal increase. The main source of these remittances, by far, has been Saudi Arabia, followed by the United Arab Emirates. Interestingly, as Table 9.11 reveals, in 1972/3 the United Kingdom was the source of more than half of Pakistan's remittances, which were then a total of only $136 million. But, what is most surprising, as much as the surge in remittances in 2002/3, is the fact that the United States replaced Saudi Arabia as the main source of workers' remittances that year. Saudi Arabia, which contributed nearly half previously, has only contributed one-seventh in this exceptional year. The reasons for this switch are also discussed in Chapter 18. After that extraordinary year, the pattern has now returned to a new normalcy, where Saudi

Arabia and the UAE contribute almost half of all remittances, but the UK and the US now also provide a large amount, signalling a different trend in the nature of remittances. It is probably correct to assume that in terms of the remittances, the post-9/11 circumstances might still guide this trend but, importantly, the nature of those who now remit incomes to Pakistan, may have undergone some change. From the unskilled workers who worked in the Middle East and Gulf states in the 1970s and 1980s, a large number of skilled Pakistanis now work and live abroad. It is probable that many of them are the new export labourers who contribute. While this causes a severe brain drain on Pakistan, it allows for remittances to grow and foreign exchange revenue to rise. However, there has been insufficient research which explains the rise in these remittances, especially during a period of global recession and major political upheaval all across the Middle East.

This section has shown that, although the nature of Pakistan's trade has changed considerably in a period of almost six decades, from producing and exporting primary products to exporting manufactured products, agricultural products, particularly cotton, still form the basis of those exports. However, for many years, Pakistan's main export has not been a tangible item, but the services provided by workers in the Middle East, again a source of income that fluctuates, as the two Gulf Wars showed. Moreover, if the Middle Eastern countries decide to opt for non-Pakistani workers, or those that provide different skills (since most Pakistanis in the Middle East provide unskilled or low-skilled services), this source of foreign exchange will also become somewhat unstable as it was prior to 9/11. Between 1973/4 and 1993, Pakistan's exports grew nine-fold. However, between 1973 and 1993, Malaysia's exports increased twelve-fold, and South Korea's twenty-eight times over; Singapore's exports, from a mere $1.8 billion (slightly above Pakistan's) in 1973 rose to a staggering $151 billion in 2004, to $350 billion in 2010, which was higher than its GDP of $222 billion. In contrast, Pakistan's GDP in 2011 was around $190 billion and its exports $25 billion. Pakistan's export and trade performance by its own standards may have improved, but clearly, by any comparison, Pakistan has not been able to ride the wave of dynamic export-led growth which has become a key feature of the Asian Tigers, or even of many of the other countries in the region. Some reasons for this can be found in the following sections of this chapter.

9.2 Trade Policy and Trade Regimes

9.2.1 The Early Years: 1947–58[2]

In 1948/9, Pakistan's major trading partners were India and the UK, which together accounted for 67 per cent of Pakistan's trade, and Pakistan, along with both these countries, was a member of the sterling area. In September 1949, the pound sterling was devalued by 31 per cent, and most countries linked to sterling also devalued. Pakistan, however, decided to maintain its old exchange rate and did not devalue, making imports from the UK and India cheaper, while Pakistan's exports to these two countries became more expensive. According to Rashid Amjad and Viqar Ahmad, 'the main motivation behind the non-devaluation decision was to be able to sell raw jute to Indian industry'.[3] In 1949 more than 50 per cent of West Pakistan's trade and 80 per cent of East Pakistan's trade was with India, and raw jute and cotton accounted for about 65 per cent of exports to India.[4] India, however, was 'resentful and refused to recognize the new exchange rate of its currency in terms of the Pakistani Rupee',[5] and trade between the two countries came to a halt. The Pakistani government had to abandon its more liberal import policy and impose some 'rather loose' quantitative controls on imports and exports in September 1949.

However, the trade regime was again liberalized within one year after the Korean War broke out and demand for Pakistan's exports—which were mainly composed of jute and cotton—increased by 109 per cent. Not only was there increased demand for these raw materials, but their prices also increased appreciably. The balance of payments position improved substantially, and subsequently, trade with India was also restored, but not before Pakistan had found other trading partners as well. The Korean boom lasted about two years and, as the balance of payments situation was particularly good, the government liberalized trade to the extent that by June 1951 as much as 85 per cent of the

imports were virtually without licence, importable on the Open General Licence System (OGL)[6] (see Box 9.1).

Following the collapse of the Korean boom, the government reimposed trade and foreign exchange controls in 1952, which according to an Asian Development Bank Study was 'probably the most important cause of the rapid rate of growth of manufacturing in Pakistan'[7] in the early years. The study continues:

> Probably the most important cause of the rapid rate of growth of manufacturing in Pakistan was the system of trade and foreign exchange controls it adopted. The country set off on this course in 1952 when it chose licensing and quantitative import controls over devaluation as a means of dealing with its balance-of-payments problems which emerged after the collapse of the Korean War raw material boom.
>
> Indeed, the import control system adopted in 1952 remained the sole basis of import licensing decisions up to 1959, and was dominant in these decisions throughout the 1960s. This system allowed the rupee to remain overvalued throughout the period, which in turn created excess demand for imports at duty-paid prices and made rationing of imports via quantitative controls necessary.[8]

This policy of 'high tariff walls and stringent quantitative controls on imports'[9] was responsible for the initiation of industrialization in general, and of the import substituting industrialization in particular, which took place in the 1950s. For Stephen Lewis, the decision by the government not to devalue in either 1949 or 1952, but instead to rely on exchange controls and quantitative restrictions to control imports, was one of the 'two major factors determining the course of industrial growth in Pakistan in the 1950s and into the early sixties'.[10] As high tariffs on consumer products raised their domestic prices, and industry became more profitable as an option than trade, it became profitable to shift into the production of these commodities domestically (see Table 9.12 for the rate of duty on imported goods). Also, there was no real export promotion policy at least until 1956, when the Export Promotion Scheme, which covered 67 primary commodities and 58 manufactured goods, was introduced, whereby exporters were entitled 'to be granted import licences for certain specific items to the extent of 25 per cent and 40 per cent on various categories of manufactured goods and 15 per cent on the export of raw materials'.[11]

The trade restrictions that were imposed determined both the extent and pattern of industrialization that was established in the 1950s and that set the trend for later developments. The trade restrictions affected industrialization in two ways:

> (i) Because of the quantitative restrictions in place, the protection to domestic producers was far greater than that implied by a comparison between domestic and duty paid prices of competitive imports, and (ii) the general scarcity created by the licensing system meant that the incentives for investment were raised across

> the board rather than differentially between industries. The former points to the degree of channelling of investments that did take place and the latter [indicates] that any bias created by the differences in tariff rates across sectors was offset by the licensing system.[12]

Viqar Ahmed and Rashid Amjad argue that these

> import controls became a very powerful lever in the hands of the government to affect and influence resource allocation in the domestic economy. Firstly, the import control system after 1952 favoured mainly the establishment of consumer goods industries by restricting the import of consumer goods and hindered the establishment of capital goods and intermediate goods industries since imports were freely allowed. Secondly, the government gave import licence privileges mainly to those importers who had imported during the 1950–2 period. These importers were called 'category holders' and this policy was referred to as the 'category system'. It obviously bestowed considerable economic gain on those who were in this category as they had almost a virtual monopoly in the trade of the imported items.[13]

Their analysis of these controls is that while the system was effective following the post-Korean recession between 1952 and 1955, the control mechanisms 'not only failed to keep pace with the basic economic changes, it also became a source of corruption and bribery'.[14] It further resulted in importers making monopoly profits, especially after the category system was introduced, and they argue, 'the licence system also became a source of economic disparity between East and West Pakistan',[15] as there were many more West Pakistani importers who received import licences.

The work by Stephen Lewis on trade policy and industrialization in Pakistan is of particular interest, for he has extensively analysed the relationship between the two and the effect of the former on the latter, for the 1950s and 1960s. He writes that after 1952 the salient features of the trade policy adopted by Pakistan were: '(i) overvaluation of the rupee with respect to other countries, (ii) use of quantitative controls on imports to regulate the level and the composition of imported goods and (iii) a highly differentiated structure of tariffs on imports and export taxes on jute and cotton'.[16] The tariff structure favoured in the earlier years was of a cascading type, with lower tariffs on intermediate and capital goods than on final goods or more

fully processed intermediate goods. Moreover, there was no duty levied on capital goods or on industrial raw materials.

However, Lewis makes the important point that 'while the tariff structure played some role in directing resources in Pakistan, *that role was a relatively minor one*. The principal determinant of the structure of imports and the set of domestic relative prices was the import licensing system.'[17]

Moreover, he makes the very interesting observation that, despite numerous interventions and distortions by the government in the 1950s, the structure of production would have been quite similar without them. He argues that

> the differentiated effects of the tariff structure, the system of import licences, and the overvalued currency had little influence on the structure of production that began to emerge in the mid 50s since the scarcity of all manufactured goods in Pakistan made it profitable to produce almost any kind of manufacture. The restrictive trade policy *speeded the process* of industrial growth by transferring substantial amounts of income from the agricultural sector to manufactures, but it is *unlikely if the structure of production* would *have been any different* if, say, a floating exchange rate had been adopted to deal with the exchange crisis of 1952.[18]

Hence, for Lewis, unlike other observers, the trade policies and the trade regime were not the principal cause of the pattern of industrial production adopted in the first decade, but only acted as a catalyst. For Lewis, the main cause of the structure of industrial production was the imbalance between the supply and demand for manufactured goods.

9.2.2 Trade Policy and the Decade of Development

A key feature of the high growth rates in industry in the 1960s was the trade regime adopted by the military government of Ayub Khan. Possibly the single most important component of the trade policy was the Export Bonus or Bonus Voucher Scheme (see Box 9.3). A study by the Asian Development Bank summarizes the key features of the trade regime as follows:

> The martial law government which came to power in 1958 began to dismantle the system of direct controls on imports, prices, profit margins, and investment. One important component of this program was the adoption of the Export Bonus Scheme in 1959. This scheme was essentially a floating multiple exchange rate for exports. The gradual liberalization of import controls continued with the Open General Licensing System and the Repeat and Automatic Licensing Schemes introduced in 1961, and reached a peak with the introduction of the Free List for selected raw materials in 1964 [see Table 9.12]. This liberalization process was unfortunately reversed in order to meet the foreign exchange shortages which arose after the war with India in 1965, the Government once again opting for direct controls.[19]

Stephen Lewis argues that after 1959 there were a number of changes in economic policy and a shift from direct to indirect controls on imports. In addition, a 'number of measures were taken in import licensing that made market forces more important in determining the commodity composition of imports and the distribution of ownership of import licences'.[20]

Unlike in the earlier years, during the 1960s there was a direct emphasis on the promotion of manufactured exports as special consideration was given to exporting industries through the Export Bonus Scheme, and additional licences were also made available to import raw materials and spare parts. Those industries that were export-oriented received a higher percentage of entitlement in licences.

The import liberalizing programme that started in 1959 along with the Bonus Voucher Scheme was responsible for the following:

> (i) over 1959–64 total imports increased much more rapidly than exports or GNP, and the composition of imports continued to shift towards the import of capital goods and processed intermediate goods (ii) market forces were increasingly relied upon to determine the commodity composition of imports (iii) a variety of new devices were introduced into the licensing scheme to increase the flexibility of entrance into the import trade (iv) substantial increases in the rates of duties on import goods which acted from the cost side, to reduce excess demand for imports.[21]

In addition, the Open General Licensing system was expanded to allow newcomers to enter the import trade 'particularly those from areas outside the major industrial and commercial centres. One of its principal effects was to give a wider distribution of the gains from processing an import licence',[22] with a large amount of foreign exchange allocated to the new OGL importers. Hence, the monopoly of the category holders of the 1950s was broken. In 1961 eleven commodities were on the OGL list, which was increased to fifty-one by 1964. Despite the numerous liberalizing measures taken in the early 1960s, Viqar Ahmed and Rashid Amjad argue that 'the import trade was still more or less controlled by the licence system which was strongly biased towards capital goods imports'.[23]

The Export Bonus Scheme undoubtedly had a positive effect on exports in the early 1960s. The scheme compensated for the overvalued exchange rate and increased exports, particularly of manufactured goods. The export of raw jute fell from 60 per cent of total exports in 1958/9 to 20 per cent in 1968/9, while exports of cotton and jute textiles increased from 8.3 to 35 per cent in the same period, and other exports increased from 2 to 20 per cent in the same ten years.[24] The Bonus Voucher Scheme also made the import of raw materials and machinery much easier when there was increased demand for such imports. For Asad Sayeed, the scheme 'was an ingenious incentive for both export expansion and import

Box 9.3

The Export Bonus Scheme

The Bonus Voucher or Export Bonus Scheme has been singled out as one of the most important instruments causing distortions in Pakistan's trade and industrialization process. However, a few studies have challenged that assertion and this excerpt from an Asian Development Bank Study reaches different conclusions.

> Success in maintaining the momentum of growth in manufacturing during the 1960s was largely due to the Export Bonus Scheme which allowed Pakistan to avoid to some degree the inefficiencies of prolonged import substitution.
>
> Introduced in 1959, this scheme provided exchange rates to exporters of manufactured goods more favourable than the official rate. Essentially, it allowed exporters of manufactured goods to receive a percentage of their export earnings in the form of transferable Bonus Vouchers in addition to the rupee equivalent of their export earnings converted at the official rate. These vouchers allowed the holder either: (i) to purchase an equivalent amount of foreign exchange at the official rate which can be used to import any item on the Bonus list, or (ii) to sell the voucher on an organized market. Since Bonus Vouchers were generally quoted on the stock exchange at 1.5 to 1.8 times their face value, the effective exchange rate for voucher recipients was Rs. 6.19 to Rs. 7.62 per dollar or even higher against the official rate of Rs. 4.76 per dollar. This compensated exporters of manufactured goods for the overvaluation of the rupee, allowing them to successfully compete in international markets, and helped to replace import-substitution-based growth with export expansion.
>
> There is considerable evidence of the impact of the Export Bonus Scheme on promoting manufactured exports. [Meekal] Ahmad [had] found that 'empirical investigation shows that the introduction of the Export Bonus Scheme in 1959 rotated the entire export function upwards'. Nurul Islam also found a high elasticity of export supply with respect to the export incentive schemes. However, the correlation between the ranking of manufactured exports by effective exchange rates and domestic resource cost was low and insignificant, leading to the conclusion that changes in effective exchange rates brought about by the frequent variation in bonus entitlement during the post-1965 period tended to confuse private decision-makers.
>
> The Export Bonus Scheme also functioned as a safety valve for imports of critical items by industry, thus providing some flexibility to the import licensing system. However, until the mid-1960s it was primarily used for importing luxury goods since the effective exchange rate on imports under the scheme was Rs. 11.90 per dollar or more. Because of declining foreign aid and the resulting foreign exchange shortages, a cash-cum-bonus list for most industrial raw materials was introduced in 1967 which provided an intermediate rate of Rs. 8.33 per dollar. Following this, the Export Bonus Scheme became something akin to a full fledged multiple exchange rate since it operated both on the import and export sides.

substitution'.[25] He quotes a study where it was shown that the Bonus Voucher Scheme accounted for 72 per cent of the effect of incentives on exports.

Although exports did increase due to the Bonus Voucher Scheme, the scheme has been criticized for giving wrong signals and causing distortions (see Box 9.3). Viqar Ahmed and Rashid Amjad criticize the scheme on the following grounds:

> The value of exports covered under the scheme did increase appreciably but the data does not tell the whole story. The rise in exports of processed goods was at the expense of the raw materials that would otherwise have been exported. Also, to the extent that the diversion of certain goods from the home to the foreign market releases domestic purchasing power to procure goods which could otherwise be exported, there is a presumed loss of earnings. Moreover, allowing for a trend factor, some rise in exports may have taken place even if this scheme had not been introduced. Finally, many exporters sold their goods in the foreign market at lower prices, sometimes even below cost, since they calculated their return in rupees in which terms the loss could be made up by the sale of bonus vouchers.[26]

The early import liberalizing policy of the military government included the dismantling of the import controls of the 1950s, and the items importable on licences, which were 90.3 per cent of imports in 1960/1, fell to 39.5 per cent in 1964/5 (Table 9.13). Also, the Free List, where commodities could be imported without licences, was increased from four to fifty items in two years, and by 1964/5 about half of all imports were on the Free List.

One reason why the government was able to be so generous in its import policy was the large amount of foreign aid the military government received. More than 40 per cent of the imports of the government were financed by the foreign aid component, which was 6 per cent of GDP in 1964/5.[27] The Asian Development Bank study argues that 'clearly, the import liberalization that took place during the first half of the 1960s, would have been impossible without this large increase in aid'.[28] Following the foreign exchange squeeze when aid was severely curtailed after June 1965, the government had to abandon its liberal import policy and

Table 9.13
Change in Import Patterns from Licences to Bonus Vouchers in the 1960s

Year	Licensed	Free List[a]	Bonus
1960/1	90.3	–	9.7
1961/2	89.6	–	9.4
1962/3	86.3	2.8	10.9
1963/4	75.3	14.9	9.8
1964/5	39.5	48.9	11.6
1965/6	32.6	40.0	27.4
1966/7	26.2	49.9	23.9

[a]After June 1965, the Free List was subject to varying and increasing degrees of administrative restriction.

felt it necessary to reimpose a number of import controls. The Free List, for example—'the most important step in the decontrol of imports taken during the first half of the 60s—was subject to increasing administrative restrictions which negated its very purpose'.[29] The Free List was reduced from sixty-six items in 1964 to fourteen in 1968 and to eleven in 1971. There was also a cut in the licensable list, but the Bonus List expanded from 215 in 1966/7 to 277 in 1970.[30]

9.2.3 A New Country: 1972–77

The Bhutto government took over a Pakistan in 1971 that was different in almost every respect from that of the 1950s and 1960s. Most importantly, the East Wing had become independent Bangladesh. Not only was half the country no longer part of Pakistan, but most of the policies of the 1960s which were held responsible for the negative outcomes regarding income and regional inequality were also quickly done away with. The People's Party government in December 1971 took over a new country and especially with regard to the trade regime.

Almost half of West Pakistan's 'exports' went to East Pakistan in 1969/70, while 18 per cent of the western region's imports came from the east (see Box 9.2).[31] East Pakistan sold its jute, tea, and other products in international markets and earned over half of united Pakistan's exports, paying for its own imports through these export receipts. On account of East Pakistan's exports, West Pakistan was in a position to import much more than its own export earnings, since raw jute and jute textiles were Pakistan's main export earners. Thus, the loss of East Pakistan was a major structural break for Pakistan. In addition, many of the reforms that were identified with the Ayub Khan regime were perceived to be the causes of income concentration in the 1960s. In May 1972 the government took steps to abolish the import licensing system, as well as the multiple exchange rate system and the Export Bonus Scheme, and the import of all luxury items was banned. However, 'the most dramatic and perhaps the most crucial of the economic measures taken in the early months of the PPP government was the devaluation of the rupee. A criticism of the Ayub and Yahya regimes had been their unwillingness to devalue the rupee, despite the exchange rate's patent unrealistic and distortive effects on exports and investment decisions.'[32]

In May 1972, along with the other measures listed above, the rupee was devalued by 56 per cent from Rs. 4.74 to one US dollar to Rs. 11, and after the US dollar was devalued in February 1973, the rupee found its new exchange value of Rs. 9.90 to one US dollar, a rate that remained fixed for about eight years (see Box 9.4).

After the devaluation, there were considerable changes in import policy. Viqar Ahmed and Rashid Amjad write that

> except for a few items reserved for industrial users, all registered importers could obtain licences for any number of importable items. The import trade was thus thrown wide open and imports were again liberalized after having gone through a restrictive phase. This was

Box 9.4
A Pegged Exchange Rate

John Adams and Sabiha Iqbal explain how the crawling peg works:

> When a country decides to peg its currency to that of a major trading partner, the rate between the two is stabilized, but the two currencies then move jointly against others. Such a policy means that the pegged country abandons autonomous control of its exchange rate which then moves independently of its policies and conditions. An increase in the value of the currency, due to a rise in the value of the currency to which it is pegged, could damage exports by limiting growth and diversification of exports. Pakistan was in this situation during the 1970s when the rupee was pegged to the US dollar. The dollar and the rupee moved downwards between 1972 and 1975 and this encouraged Pakistan's exports, but with the appreciation of the dollar in 1976–77 there were complaints from exporters that their competitiveness was being damaged. In any case, neither the downward nor the upward movement in the value of the dollar, and of the linked rupee, reflected cost and price changes in Pakistan. Moreover, Pakistan's trade has become diversified enough to reduce the predominant importance of the US dollar in its external transactions.

Source: Adams, John and Sabiha Iqbal, *Exports, Politics and Economic Development in Pakistan* (Lahore: Vanguard, 1987), 59–60.

> done in order to increase the availability of all types of goods so that industries could improve their capacity utilization and increase production in anticipation of a higher demand for exportable goods as a result of devaluation. The liberalization trend continued during the seventies and the Free List was extended to 407 items in 1976 and 438 in 1978–9.[33]

John Adams and Sabiha Iqbal write that 'a prominent feature of the Bhutto era was the absence of an explicit export policy. Between 1972 and 1977, and even beyond, Pakistan lacked a formal, organized export policy in which clear objectives and the means to realize them were laid out. . . . The government never issued a formal document, or sequence of documents, articulating an export policy.'[34] They argue that 'there was a lack of appreciation of the role of exports in the nation's development. Decisions that were made were often inconsistent with existing policy. The result was that economic incentives and disincentives for exports coexisted simultaneously.'[35]

Thus, the devaluation was seen as the main, if not the only, means of encouraging exports, and exports did indeed grow by 38.4 and 24.7 per cent in 1972/3 and 1973/4, respectively.[36] The government also collected additional revenue by imposing export taxes and was able to share in the windfall profits generated. However, the export boom was short lived due to the quadrupling of oil prices in 1974—affecting oil and fertilizer imports, and worsening the balance of payments position—and the recession that followed in the developed countries. Moreover, a sequence of bad crops due to floods, pests, and other natural factors affected cotton and rice, Pakistan's two main export items. Hence all positive effects of the devaluation were very soon lost and the consequences on the rebound were particularly severe.

The one—probably the only—positive outcome for Pakistan of the developments on the international scene in the mid-1970s was a consequence of the oil price rise and boom in the Middle East. Pakistan was one of those countries that gained in various ways from the opening up of the new markets. In terms of labour and commodity exports, the new Middle East markets were able, partially, to compensate for the loss of East Pakistan's exports. Remittances touched about US$3 billion in the 1980s and in many ways transformed the social structure of the country, but the beneficiary of the opening up of the Middle East was not Bhutto, who was responsible for building close ties with the Islamic countries, but his detractor General Zia.

It is difficult to identify many positive export-promoting measures by the Bhutto government, with the possible exception of the concessionary credit facilities for exporters, where the rate of interest charged by commercial banks on export credits was lower than the normal bank lending rate. Other than that, the following verdict from John Adams and Sahiba Iqbal best summarizes the policies of the Bhutto government towards exports.

> Between 1972 and 1977 Pakistan did not devise an adequate policy to encourage exports. The various measures were complex and provided weak incentives, often inclined towards big exporters with established records. Emerging firms did not qualify for many programs. Exemptions from excise and sales taxes were not positive incentives but merely equalized Pakistan's external competitive position. The Bhutto government was absorbed in domestic reforms and connected exports and export concessions with the previous orientation towards fostering big industries. The bureaucracy was demoralized and not charged with formulating export policy. Policy first moved in the direction of diverting potential profits from the devaluation. Poor export performance, attributable to a weak international economy and to a lack of domestic push, engendered new incentive policies. These policies were devised slowly, in a patchwork way, with many changes. The direction of movement was to facilitate most kinds of exports but most programs were not heavily utilized and were not very effective.[37]

9.2.4 The Beginning of a Liberal Trade Regime: 1977–88

Soon after coming into power, the Zia government began a series of steps to liberalize the trade regime, particularly imports, by reducing the number of banned goods and lifting other restrictions. Most non-tariff barriers, which had been imposed after the oil shock and foreign exchange stringency in the 1970s, were also removed. Between 1977 and 1983 the number of items on the Free List was increased and the procedure for importing commodities was streamlined and made much easier. In 1977, the Free List contained 438 items, and by 1982/3 91 new items had been added, including some consumer items.[38]

Despite these early measures, the World Bank, in a report examining the trade policy regime of the 1980s, argued that in 1980, 'Pakistan's import regime reached its most restrictive stage, [and] about 41% of the domestic industrial value added was protected by import bans, and another 22% by various forms of import restrictions. By 1986, the equivalent percentages were 29% and 3.7%, respectively.'[39]

The government took the step of removing explicit import quotas on non-capital imports and the 'number of commodity categories subject to import licensing value ceilings was reduced from 406 in 1980/81 to 5 consumer goods in July 1983'.[40] In addition, previously banned and restricted imports were also liberalized. In July 1983, when the import policy for the fiscal year 1983/4 was announced, the classification of imports was changed:

> Whereas previously all items not specifically permitted were banned, now all items not specifically banned were importable. Under the present system there are two lists: a banned list and a restricted list, the latter having three parts: consumer goods subject to quantitative restrictions, items importable exclusively from a tied source, and items importable by the public sector only. Along with the above changes, a

> number of items were made freely importable: 148 previously banned items, 5 items previously importable only by the public sector, and 15 items, previous importable only from tied sources. In September 1983, 70 additional items were removed from the negative list, of which 14 were transferred to the tied list, 17 were placed on the list of items importable only by the public sector, and the remaining 39 items were made fully importable. Another significant feature of import liberalization was the virtual elimination of licensing ceilings for permitted imports, though import licensing remains in effect.[41]

While tariff and import duty adjustments were a repeated occurrence in the 1980s, some measures were also taken to boost exports. These measures included export rebates, concessionary credit for exports, and income tax and import facilities for exporters. However, the most important policy reforms that affected exports were the delinking of the Pakistani rupee from the dollar and the introduction of a flexible exchange rate. Earlier, the rupee/dollar rate was fixed at Rs. 9.90 per dollar, and the strong dollar in 1980/1 also appreciated the Pakistani rupee vis-à-vis other currencies, reducing the competitiveness of Pakistan's exports on world markets.

Although there were frequent tariff reductions during the Zia regime, in 1986 Pakistan's nominal tariff rates for manufacturing industries were still among the highest in the world.[42] Table 9.14 shows the nominal tariffs faced by Pakistan's imports in 1987. In June 1987, comprehensive changes were made in the trade regime, where tariff slabs were reduced from 17 to 10. Other changes included the reduction of the economy-wide unweighted average tariff from 77 per cent to 66 per cent, while the dispersion of the tariffs remained the same. The largest proportionate decline was in capital goods, where the average tariff fell from 61 to 51 per cent.[43] Despite these changes, 'about 50% of all tariff categories, and 84% of consumer goods, carry customs duties in excess of 75%'.[44] By 1988 the World Bank felt that the trade regime that existed then 'still seems to be biased in favour of import substituting production. Domestic markets are insulated from foreign competition through non-tariff barriers and high tariffs.'[45]

9.2.5 Trade Liberalization Under Structural Adjustment: 1988 Onwards

In the budget announced in June 1988, a number of important and far-reaching measures were announced with regard to the trade policy.

> The main policy measures consisted of improving the tariff structure, reducing the number of items in the banned and restricted lists, creating a better set of export incentives, and streamlining import licensing requirements. The maximum ad valorem duty rate on all imports, with the exception for luxury cars and alcoholic beverages, was reduced from a range of 150%–225% to 125%. This change affected close to 400 items, mostly consumer goods. In conjunction with this measure, the authorities reduced the average level and narrowed the dispersion of duty rates on imported raw materials, which now range from 20 to 50% ad valorem. Greater rationalization of the tariff structure was also accomplished by consolidating the duty rates on all items with similar degree of processing within a narrow range and by adopting graduated rates on most imports according to the stage or processing. In all, tariff rates were decreased for a total of 1134 items and increased for 462 items, out of a total of more than 3200 tariff lines. The improvement in the dispersion of the duty rates, particularly for imported inputs not produced in Pakistan, should help to spur industrial activity and economic growth. Similar positive effects

> should result from the decision to reduce the number of commodities whose import were previously prohibited or restricted.[46]

Under the first major Structural Adjustment Programme begun in 1988, the government of Pakistan was committed to making extensive changes in its trade regime. The major components of the agreement with the IMF which related to foreign trade were as follows:

> The emphasis is on the removal of non-tariff barriers (NTBs) and their replacement by tariffs, with the objective of reducing the number of banned commodity categories from about 400 to 80 by FY91 [1990/1], leaving only those on account of religion, security, reciprocity, and international agreements. Also on the import side, the adjustment program contains tariff measures as well, including the reduction of the maximum tariff to 125% in FY89 and further to 100% by FY91, tariff alterations aimed at establishing some escalation with the degree of processing, and gradual removal of most tariff exemptions and concessions, except the duty drawbacks afforded to exports and exemptions granted to some key industries. Phasing out tariff exemptions will help the resource mobilization effort and also constitute an important step in the process of streamlining the tariff structure. On the export side, the adjustment program continues to emphasize export promotion by replacing the previous uniform income tax rebate system with a graduated one that encourages higher valued exports, by permitting Export Houses to retain a small part (5%) of their foreign exchange earnings, and by allowing the private sector a greater involvement in exporting rice and cotton.[47]

By 1993 a number of important steps based on the Structural Adjustment Programme had been taken. The maximum tariff had been reduced from 225 per cent in 1988 to 90 per cent at the end of the adjustment programme. In March 1991, import licensing had been abolished except for commodities on the negative list, while this list of banned and restricted imports was cut down.

One of the more important policies undertaken by the government was initiated in February 1991, when resident Pakistanis were allowed to open foreign currency deposit (FCD) accounts, which were previously allowed only to foreigners and non-resident Pakistanis. The procedure for opening such FCD accounts was greatly liberalized and banks paid higher interest rates on these deposits than LIBOR.[48] Although the rupee was not fully convertible, no questions were asked about the source of funds. Foreign currency deposits increased from $1.6 billion in June 1988 to $2.3 billion in February 1991, and to $3.7 billion in June 1992, rising to more than $8.5 billion in August 1996. Of the last amount, 37 per cent was held by Pakistani residents.[49] The World Bank believed that since 1990 'the foreign exchange inflows into FCDs have significantly helped meet Pakistan's external financing requirements. In FY92 new inflows into FCDs were almost as large (about 75%) as Pakistan's total capital account balance. *However, the reliance on FCDs has increased Pakistan's vulnerability to external shocks*, in particular in view of the low reserve cover.'[50] A warning which was prescient and came true in May 1998 when the government froze the FCD accounts after its nuclear tests—see Chapter 18.

At the end of the 1988 Structural Adjustment Programme, the World Bank suggested that the government of Pakistan should take the trade policy measures further, especially with reference to the trade taxation regime. These measures included:

> (i) removal of all remaining non-tariff barriers to imports, except those in force for health, safety, and religious reasons; (ii) removal of import tax exemptions and partial concessions, except to exporters; and conversion of specific duties into ad valorem duties; (iii) reduction of the range of customs duty rates with a maximum rate of 30% and a minimum rate of 10% (with only 3 rates, 10% for raw materials, 20% for intermediates, 30% for finished consumer goods); (iv) removal of Iqra and the license fee; (v) elimination of export taxes; and (vi) extension of the coverage of the sales tax to imports of all manufactured goods, concurrently with the removal of exemptions from sales tax granted to domestically produced manufactures, and elimination of any inequality in the treatment of domestically produced and imported goods with regard to excise duties. Finally, further actions are also needed to reform the existing deletion programs (related to domestic content requirements) and to enhance the effectiveness of export promotion schemes aimed at putting exporters on a 'duty-free basis' while at the same time reviewing the cost effectiveness of other export incentives such as the income tax rebates. Such a program should be accompanied by continued active and timely use of the exchange rate policy.[51]

In light of these and other recommendations, the government in 1993 announced a new trade reform package, the main features of which were as follows:

1. Maximum tariff levels will be set at only 35 or 50 per cent with six slabs of 10, 15, 25, 35, 45, and 50 per cent. Existing tariff rates will apply to motor vehicles, alcoholic beverages, POL, wheat, fertilizers, pesticides, and life-saving drugs.
2. Tariff reduction will be phased in gradually over a three-year period.
3. Many concessions and exemptions present in the existing tariff regime will be withdrawn gradually.
4. Tariff structure will represent a cascading of nominal tariffs with progressive stages of manufacturing. Locally produced goods will be subjected to higher tariff rates compared to goods not produced domestically.

5. Tariffs on machinery and equipment will be 10 per cent unless this machinery is produced locally.
6. High-priority domestic industries (such as engineering and chemicals) will receive nominal protection of 50 per cent.
7. Raw materials and intermediate goods predominantly used in the production of exports would be subjected to zero rate of duty.
8. Existing import licence fee, Iqra surcharge, and flood relief surcharge will be merged with the statutory tariff rates.[52]

The importance of the trade regime, and imports in particular, can be gauged from the fact that 54 per cent of total federal government revenue in 1992/3 originated from import taxes. Hence, any attempt to change the tariff regime would also have significant effects on revenue generation.

Riaz Riazuddin evaluates this policy and in Table 9.15 shows the rate-wise value of imports and import duties for the fiscal year 1991/2. He shows that as much as 45 per cent of total imports were no longer subject to any duty. And although the statutory duty rates ranged from 0 to 435 per cent, 'the effective rate of duty which is the proportion of actual duty collection to the value of imports subjected to duty is only 33 per cent'.[53] The table also shows that as much as 61 per cent of collection was obtained from the statutory duty range of 40–90 per cent, while duty rates of below and above this range contributed only 16 per cent of the collection.

For Riazuddin, 'there is a likelihood that lower tariffs in the short run can cause balance of payment difficulties as well as displacement costs. The phased reduction of tariffs and gradual withdrawal of exemptions is likely to lessen these costs.'[54] These suggestions are quite different to those proposed by the World Bank, which believed that 'with regard to the phasing of the proposed reforms package, international experience *shows that a speedy process is feasible and has strong advantages*'.[55] The World Bank cites Mexico's trade reform programme of 1985–9 as a good example of this approach, where the maximum tariff rate was reduced from 100 per cent to just 20 per cent within two years. Given Mexico's geographical and political importance with respect to the USA, and the fact that it is one of the three states along with the USA and Canada which form the North American Free Trade Association (NAFTA), the comparison with Pakistan may seem a little irrelevant. Moreover, the crash of the Mexican economy in December 1994 was also blamed on the liberalization programme followed by its government, and other countries would be wiser to learn from Mexico's mistakes rather than follow its example (see also Chapter 17). (The international trade environment has changed since the formation of the World Trade Organization in 1995. Repercussions for Pakistan are discussed in Section 9.5 and Appendix 9.1.) It would be fair to say, that from the mid-1990s and after the formation of the WTO, there has not been significant reform in the trade sector in Pakistan. Most of the trade reforms were undertaken in the 1988–95 period, and other than occasional interventions to change a few rates or to give some incentives, the basic structure and direction of intervention has been the same since the mid-1990s.

9.3 The Debate Over Efficiency and the Trade Regime

Asad Sayeed writes that 'protection through tariffs, quotas and exchange rate distortions is deemed to distort allocative efficiency and hence reduce growth and productivity of the economy over time'.[56] We will now examine this claim with respect to trade policy in Pakistan, especially in the 1980s. (Although some of the discussion from Section 8.6 is repeated here, this present section focuses more on trade-related inefficiencies and the impact on the effective exchange rate.)

With respect to the rapid industrialization and high growth of exports in the 1960s, John Adams and Sabiha Iqbal summarize the issues as follows: 'Pakistan followed a highly protective industrial policy to encourage import substitution. Incentives were provided in the form of a highly graduated tariff structure, import licensing, and quantitative restrictions on imports. At the same time, elaborate stimuli were provided to encourage the export of manufactured

Table 9.15
Rate-Wise Value of Imports and Duties: 1991/2

Statutory rate of duty	Total import value	Duty-free imports	Dutiable imports	Import duty	Effective rate of duty
Zero to 40%	44,843	32,391	12,425	2,600	21
40% to 90%	67,771	20,187	47,584	19,593	41
90% to 435%	4,023	813	3,210	2,307	72

goods.'[57] Asad Sayeed argues that 'the incentives provided by the tariff structure have been the central bone of contention in discussions about efficiency of the industrial sector in the 1960s'[58] And the result, for John Adams and Sabiha Iqbal as for so many others before them (see Section 8.6 in the previous chapter), was as follows:

> Although the profusion of inducements encouraged the growth of the output and exports of the manufacturing sector, they generated inefficient resource use in industry and created a bias against exports of agricultural goods. Within the manufacturing sector resources were often attracted to high-cost industries dependent upon imported inputs. Guisinger and Lewis estimated effective rates of protection for thirty industries and found negative value-added for three cases, implying that the world market value of material inputs exceeded the value of output. Others were also critical of the import-substitution policy. Pakistan's industries were using processes which were economically inefficient, when judged by world market prices for inputs and output. Since domestic prices had become distorted by tariffs, quantitative restrictions, and multiple exchange rates, economically inefficient choices of processes and techniques by private businessmen became real possibilities. In effect, producers could purchase capital inputs at well below the opportunity cost to the economy since they were direct licensees for imported goods. An incentive was thereby created to use excessively capital-intensive techniques. Khan found that the capital–labour ratio in many industries in Pakistan was higher than in countries where labour was far less abundant.[59]

We have argued in Section 8.6 that almost all these allegations were proven to be incorrect by scholars once they studied the data in much greater detail. However, even today the same sort of criticism continues to be launched of the industrial policy pursued in Pakistan.

In recent years, the World Bank and the IMF have become the greatest champions of free trade in Pakistan and all across the globe. They castigate countries like Pakistan for maintaining tariffs, restrictions, and non-tariff barriers, and, in general, an import-substituting regime. The World Bank and the IMF argue that such import-substituting policies have an anti-export bias and cause allocative inefficiencies. Their recommendations include a drastic cut in tariffs, the removal of all non-tariff barriers, and constant devaluation. They recommend a 'liberalized', 'neutral' trade regime based on the 'rationalization' of the tariff structure, with lower average tariff rates and the elimination of exemptions. For them, not to take these comprehensive steps would result in continued inefficiency.

The World Bank, in its analysis of the trade regime in Pakistan, argues that despite the very extensive and far-reaching changes that have been made since the early 1980s, 'the changes have not been substantial enough to establish a more neutral trade regime'.[60] The continued presence of non-tariff barriers is a problem because they 'generate more serious distortions, with greater resource allocation inefficiencies, than direct price protection obtained through tariffs'.[61] Moreover, they create a host of other inefficiencies, as follows:

> As is well known, import bans/restrictions break the link between domestic and international relative prices, pushing the economy further away from resource allocation patterns consistent with the country's comparative advantage. NTBs [non-tariff barriers] work to create monopolies and oligopolies through the elimination of foreign competition in industries where scale economies are important. Government attempts to regulate and control such markets rarely achieve the level of efficiency generated by the spur of foreign competition. In other industries where the domestic market is too small to support production at a minimum efficient scale, NTBs, combined with existing investment sanctioning procedures, allow several firms to operate profitably in the small domestic market with no pressure to improve their cost competitiveness. Examples of fragmentation of production are evident in some of Pakistan's manufacturing industries, such as transport equipment, polyester yarn, electrical machinery, and household appliances.[62]

The World Bank very strongly recommends the replacement of non-tariff barriers by tariffs, as the latter form of protection for domestic industry is deemed to be much less inefficient. However, due to the high tariff rates and dispersion of the tariffs, the structure is still considered to be highly inefficient and protectionist. Summarizing the main features of the trade regime in the late 1980s, with its numerous faults and resulting distortions, the World Bank argues that

> Pakistan's import regime provides high and extremely uneven levels of protection afforded to various domestic industries, with many commodities benefiting from almost absolute protection (subject to the fact that smuggling restricts these levels). Due to exemptions, baggage allowances and extensive smuggling, some products enjoy lower nominal protection than those implied by the statutory tariff rates. This combination of heavy protection and extensive exemptions and import leakages (formal and informal) has fostered an inconsistent structure of protection with indeterminate and, perhaps, continuously changing effects on the incentives for industrial investments. As a result, socially suboptimal production and investment decisions in terms of production mix, diversification and plant scale are being undertaken while other economic opportunities are foregone. Finally, as a result of the complexity and diverse effects of various elements of the protective structure, it is very difficult for the Government to determine the effects of the present import regime and thus administer the protective system in a way that supports Pakistan's economic objectives.[63]

While the foregoing quote finds faults with the trade regime on the import side, the export side is also not spared. The World Bank believes that the trade regime has a strong anti-export bias: 'The fundamental problem is that Pakistan's export growth prospects are being adversely affected by the remaining import-substituting bias of the trade regime.'[64] This anti-export bias is shown using estimates for effective exchange rates for imports and exports and their ratios (Table 9.16). The EER (effective exchange rate) ratios in the table indicates neutrality if the ratio is 1, and a bias towards import substitution and against export promotion, as is actually revealed by the table, when the ratio is greater than 1. The table shows that the import substitution bias has increased over time (row 4A), and that there is a bias against primary agricultural exports (row 4C). The final conclusion: 'both the qualitative and quantitative evidence suggests that Pakistan's trade regime is still biased in favour of import-substituting production',[65] and hence is inefficient.

Just as in the 1970s there was a strong bombardment of 'evidence' and analysis that the government in the 1960s had got its industrial and trade policies all wrong, with the result that it was claimed that there was huge inefficiency in the industrial sector, so in the 1980s and 1990s the World Bank and the IMF have taken it upon themselves to expose the persistent perceived inefficiencies in Pakistan's trade and industrial regime. However, unlike the scholars who examined Pakistan's trade and industrial structure in the 1960s and found inefficiencies, the World Bank and the IMF in the 1980s and 1990s are in a position where they cannot just recommend, but impose, alternatives. Clearly, the Structural Adjustment Programmes since 1988 are evidence of that. However, even in the 1970s and later, there were a group of scholars who showed that much of what was considered to be conventional wisdom was, in fact, pure myth, and that the extent of inefficiency in the industrial structure in the 1960s was grossly exaggerated (see section 8.6 in Chapter 8). It is possible, then, that as further independent research is conducted on the trade and industrial regime of the 1980s, much of the evidence, 'both qualitative and quantitative', will be exposed as incorrect and biased. One recent study has done just that.

The work by Asad Sayeed has shown that virtually every study and analysis conducted on the manufacturing sector in Pakistan in the 1980s argues that protection through tariffs, quotas, or exchange rate distortions affects allocative efficiency negatively and, consequently, reduces growth over time. There seems to be almost an identical repeat of the situation prevalent in the 1970s at the end of the Ayub regime, when virtually every study and analysis conducted on the manufacturing sector argued that the Ayub regime was highly inefficient. Just as the high-growth regime of Ayub Khan was labelled as inefficient, so the high-growth Zia regime been put in the same category.[66]

Asad Sayeed has taken great pains to show that much of what has been suggested about the consequences of the trade regime under Zia is incorrect. Although Pakistan had the highest average tariff rates compared with other developing countries in 1986, *there was no direct relationship with the growth performance of the manufacturing sector*—in other words, countries with low tariffs do not necessarily have high growth, and vice versa.[67] The World Bank has also held Pakistan's high tariff dispersion to be a cause of inefficiency in the industrial sector, yet it has been shown that 'a high dispersion of tariffs was central to Taiwan's successful trade regime'.[68] Moreover, it has been seen that countries with the highest dispersion in tariffs may actually have high growth rates in manufacturing.

Sayeed's study also questions the overemphasis on showing the causality between tariffs and growth, and shows that actually 'productivity growth, or any other measure of efficiency, therefore, is more critically determined by other policies and the political economy of the sector'[69] and tariffs cannot be singled out as the causal factor. The empirical and conceptual problems that effective rates of protection (a central component of perceived inefficiency in the industrial sector) had in the scholarship of researchers in the 1970s still persist, and Asad Sayeed finds that there are serious difficulties in their calculation and use. He very strongly rejects the claims made by the World Bank that Pakistan's import policy has resulted in inefficiency in industrial production. He says 'that the excessive importance given to the tariff and non-tariff barriers is unwarranted. Firstly, there is no definite conclusion that can be drawn about efficiency reducing elements from the import regime. Secondly, no major inconsistency between the tariff regime and the structure of tariff exemptions and non-tariff barriers was identified.'[70]

One of the major allegations against the Ayub regime was that, since there were inefficiencies in the nature of protection, there was too much emphasis on import substitution at the expense of exports. This was seen to be incorrect, for there was ample growth and diversification of exports under Ayub, despite inefficiencies and an anti-export bias. The same allegations that the trade regime of the 1980s was anti-export based are equally untrue, for Pakistan's aggregate export growth in this period was a healthy 9 per cent per annum. While there are numerous problems with Pakistan's export structure, especially that it has such a narrow base, that it is dependent on one commodity—cotton—and that the textile sector has been in a crisis in recent years, the annual growth of exports has, nevertheless, been quite impressive. Clearly, there is a need to diversify into more value-added products within the textile sector, and in other sectors, but it would seem to be a little harsh to draw the conclusion, as the World Bank does, that Pakistan has had an anti-export bias.

The barrage of criticism of the industrial and trade policies of the Ayub regime was never articulated into policy, for the Ayub regime was replaced by a regime which had different priorities. Moreover, those who found fault with the policies were not in a position to implement alternatives. It was another matter that much of the analysis was found to be faulty later on. The difference is that the analysis and evidence that is currently invoked to identify the extent of inefficiency in the trade regime also makes recommendations that can actually be translated into policy. It is too soon for studies to emerge, as they did earlier, to examine in detail the claims made that industry was indeed inefficient. However, even if such evidence does emerge, it may be a little late to reverse

the policies currently being advocated and implemented since they are now part of the new, pre-liberalization, globalized, conventional wisdom.

9.4 The Exchange Rate

The exchange rate has played a critical role in the trade regime and the process of industrialization in Pakistan on more than a few occasions. As early as 1949, a conscious decision by the government of the day not to revise its exchange rate downwards, i.e. devalue, in line with the devaluation of the pound sterling by about 37 per cent, caused a great deal of uproar and eventually had serious, albeit positive, repercussions for the economy of the country (see Chapter 6 and Section 9.2 above). The decision taken by the government was so important that it has become known as the 'Non-Devaluation' decision. While the young government of Pakistan faced a serious crisis on the exchange rate front so early in its tenure, which added to numerous other crises of that era, the role that the exchange rate has played throughout the nearly fifty years of Pakistan's existence is very significant indeed. This section will highlight some of the features of the foreign exchange regime in Pakistan.

Table 9.16
Effective Exchange Rates for Exports and Imports, and their Ratio

	1980/1	1984/5	1986/7[ad]
1 **Nominal exchange rate (Rs/$) – period averages**	9.90	15.15	17.00
2 **EERs for imports[a]**			
A All imports			
a) Based on statutory import levies (EERm)	19.27	30.25	33.35
b) Based on actual import taxes (EERm2)	15.74	25.90	n.a.
B Import EER by commodity categories:			
a) Consumer goods			
EERm1	25.74	40.15	40.03
EERm2	19.01	27.30	n.a.
b) Raw materials for consumer goods			
EERm1			
EERm2	15.92	30.75	n.a.
c) Raw materials for capital goods			
EERm1			
EERm2	15.25	23.76	n.a.
d) Capital goods			
EERm1	18.13	28.50	30.60
EERm2	14.81	24.09	n.a.
e) Textile products			
EERm1	24.95	38.94	38.76
EERm2	n.a.	n.a.	n.a.
3 **EERs for exports[b]**			
A All exports (EERx)	11.02	17.18	17.92
B Export EERs by commodity categories[c]			
a) Raw cotton	8.91	13.64	15.50
b) Rice	9.90	15.15	17.00
c) Cotton yarn	11.66	16.45	17.19
d) Cotton cloth	11.75	17.75	18.22
e) Leather products	10.49	16.66	18.69
f) Carpets	10.99	18.50	18.63
g) Ready-made garments	16.25	23.79	25.00
4 **EER ratios**			
A EERm1/EERx	1.75	1.76	1.86
B EERm2/EERx	1.43	1.51	n.a.
C (EERx for manufactured exports/EERx for primary agr. exports)	1.25	1.27	1.21

[a]Customs duties, sales tax, and surcharges are included in the calculations. Due to unavailability of information on domestic and international prices, no attempt was made to take scarcity premiums resulting from non-tariff barriers into account.
[b]Duty and tax drawbacks, compensatory rebates (until mid-1986), and the subsidy components of concessionary export credited and included in the calculations.
[c]Further disaggregation was not possible because of lack of detailed data.
[d]July–November period.
Source: World Bank, *Pakistan: Growth Through Adjustment*, Report No. 7118-Pak, Washington, 1988, 74.

For nearly 35 years, Pakistan maintained a fixed-peg regime for its exchange rate. The rupee was first linked to the pound sterling in the early years after 1947, and Pakistan was a member of the sterling area. Later, as the USA became more dominant across the globe, and as Pakistan's political fortunes became more aligned with those of the USA, the US dollar became the key currency with respect to the Pakistani rupee, as it did with most other currencies.

Pakistan did not devalue in 1949 when other countries linked to the pound sterling followed the fate of the pound and devalued; nor did it devalue in 1952, following the Korean War boom, once the post-boom recession had set in and foreign exchange was scarce. Instead, Pakistan pursued import controls so that imports could be regulated and the foreign exchange crisis managed. The government was criticized on both counts: for not devaluing and for imposing controls and tariffs on the free import of goods. Such controls were considered to be inefficient in attracting scarce resources, and a more market-friendly mechanism was considered to be more efficient. Finally, the first devaluation took place in June 1955, when the rupee was devalued by 30 per cent with respect to the pound sterling in order to bring it in line with other trading countries.

For the next seventeen years, the official, nominal exchange rate of the rupee was fixed at Rs. 4.76 to one US dollar. However, as far as almost all analysts are concerned, the rupee was, for most of those seventeen years, grossly overvalued (see Sections 8.6 and 9.3). Not only was the rupee overvalued, but a system of multiple exchange rates is said to have undermined all semblance of efficiency normally attributed to a reliable and correct exchange rate value. Gustav Papanek shows how the official Pakistani exchange rate was, in a real sense, a multiple exchange rate:

> Some exporters faced an effective rate of 8 rupees to the dollar, if their commodities had been assigned 40 per cent vouchers, all of which could be sold in the open market. At the other extreme, exporters who received no vouchers and export duties faced an effective rate of less than 4.7 rupees to the dollar. . . .[71]
>
> . . . The importer who could get a regular import license paid the official exchange rate (4.7 rupees to the dollar). The importer who had to buy a bonus voucher paid more than twice that amount (as much as 12 rupees to the dollar). Finally the importer who bought a voucher restricted to the import of raw materials or investment goods, could pay yet a third rate, somewhere between the other two.[72]

The entire Ayub period, despite the substantial success related to the growth rate and exports, was criticized for maintaining multiple exchange rates and an overvalued rupee. When Zulfikar Ali Bhutto took over after the elections, much of the old order was drastically changed and the rupee was devalued by 58 per cent.

Not only did the rupee find a new value of Rs. 11 to the US dollar, but the entire system of multiple exchange rates and the Bonus Voucher Scheme was done away with. Viqar Ahmed and Rashid Amjad argue that 'the substantial net devaluation of the rupee removed at one stroke the subsidy the industrialists had received in the earlier period because of the overvalued exchange rate'.[73] While earlier in 1949, 1952, and 1967 the governments had been criticized for *not* devaluing, in 1972 the government was criticized *for* devaluation and for the extent of the devaluation. The arguments which criticized the devaluation decision were as follows:

> a) devaluation on such a high scale could have been justified if domestic production of exportable goods could also be increased rapidly which was doubtful at that particular time due to the unsettled environment created by the loss of East Pakistan;
> b) devaluation increased the cost of investment [involving foreign exchange] by about 131 per cent (which was the increase in the value of the dollar in terms of the Pakistan Rupee);
> c) the internal price structure was adversely affected since devaluation raised the overall cost structure and thus accelerated the inflationary pressures on the economy.[74]

Hence, the nominal exchange rate of the Pakistani rupee was changed by the government only twice during the period 1947–82, once by 30 per cent in 1956, and then by 58 per cent in 1972. In February 1973, the US dollar was devalued by 10 per cent and hence the Pakistani rupee was revalued by 10 per cent to Rs. 9.90 per dollar, the official rate which continued until January 1982. Until then, the government had maintained a fixed-peg exchange rate, needing to intervene only twice. The rupee/dollar exchange rate was fixed, and the Pakistani rupee's fortunes were inextricably linked to those of the dollar (see Box 9.4). When the dollar appreciated, so did Pakistan's currency with respect to its numerous other trading partners. Hence, Pakistan's economy was tied to the prospects of an economy sixty times its size. While alignment in the political sphere between Pakistan and the USA had progressed a great deal, this linking of the currencies was perhaps taking things a bit too far.

On the recommendations of the IMF, the old system of pegging the rupee was replaced by a flexible exchange rate mechanism, whereby the government of Pakistan—actually the State Bank of Pakistan, to be more precise—sets a rate for the Pakistani rupee based on a weighted average of the currencies of Pakistan's major trading partners. After 1982, the US dollar no longer retained its unique status as the determinant of the rate of the Pakistani rupee, but became one of many in the basket of currencies that collectively determine that rate. This mechanism of determining the exchange rate for the Pakistani rupee vis-à-vis other currencies, established in 1982, is still followed today. However, the very controlled nature of the exchange rate market in the 1980s has given way to a more open market in the 1990s (see Box 9.5). The 'market' rate, which is indeed determined by the supply and demand for currencies, is now the official exchange rate, and the premium between official and kerb rates is rather small.

From Rs. 4.76 to one dollar in April 1972 to Rs. 9.90 for a period of nine years, once the rupee was allowed a managed float, its value depreciated by more than 230

Box 9.5

The Foreign Exchange Market

In previous years, there was no foreign exchange 'market', and the State Bank of Pakistan rationed foreign currency. All that has now changed, and foreign currency can now be purchased openly in the market.

Foreign exchange is bought and sold in Pakistan in two markets—the official market and the parallel market. In the official market, the State Bank of Pakistan (SBP) announces every morning rates at which it stands ready to buy or sell foreign currency to authorized dealers, which, in turn, transact with customers at a specified spread. Purchases and sales of foreign currency for trade transactions are required to take place through the official market. Some capital account transactions, such as repatriable foreign currency portfolio flows, also go through the official market. In addition, banks are required to turn over foreign exchange held in foreign currency accounts to SBP at the official exchange rate, and may buy the foreign currency back when the deposit matures or is withdrawn.

All other transactions take place on the parallel market, which consists of money changers licensed by the SBP. Transactions on this market are not taxed, nor are identities of the transactors recorded. The money changers set exchange rates to equilibrate market supply and demand, thereby determining the size of the premium that foreign exchange on the parallel market commands over the official rate.

The parallel foreign exchange market in Pakistan can provide potentially useful information about the likely course of future official exchange rate adjustments by the SBP. In principle, an increase in the parallel market premium should reflect market expectations that the rupee is misaligned, presumably because reserves have dwindled or because inflation has eroded external competitiveness. In either event, a devaluation would be required to ease the economy's external adjustment.

Actual daily data from the parallel market, however, suggest that, at least in recent months, the premium does not generally anticipate changes in the official rate. Indeed, the premium tends to widen immediately *after* official exchange rate adjustments by the SBP. If, following some adjustments, the official rate is held fixed for some time, the premium tends to return to its trend level. Thus, it appears that rather than responding to economic fundamentals, the parallel foreign exchange market premium responds to exchange rate moves by the SBP in the short run.

As an alternative to selling foreign exchange on the parallel market, individuals may purchase Foreign Exchange Bearer Certificates (FEBCs) from commercial banks. FEBCs, though purchased with foreign exchange, are rupee-denominated obligations of the Government of Pakistan, and pay a rupee return. The certificates, the face value of which is determined at the official spot rate when purchased, may be encashed at any time in either rupees or foreign currency. If the bearer of the FEBC chooses to encash in foreign currency, the official spot exchange rate prevailing at the time of encashment is applied. The FEBC is a bearer certificate, and the purchaser is not required to declare the source of foreign exchange at the time of purchase.

There also exists a secondary market for FEBCs, in which the certificates are bought and sold for a premium over their face value. Arbitrage between the parallel foreign exchange market and this secondary market equates the premia associated with foreign exchange and FEBCs.

Finally, there also exists a forward market for foreign exchange. Authorized commercial banks are allowed to quote forward buy and sell rates of foreign currency in rupees for transactions that would go through the official market. While these rates are set to equate supply and demand at the various maturities, they do not necessarily reflect true market forces since market players are not allowed to take positions except to offset foreign currency receipts or payments for trade transactions.

per cent between January 1982 and June 1996 (see Table 9.17). Figure 9.2 shows the annual depreciation for each year, ranging from a minimum of 2.3 per cent in 1994/5 to 28.28 per cent in the very first year. For much of the 1980s the fall in the value of the rupee was caused by the crawling peg or floating exchange rate, under which the State Bank of Pakistan nominally depreciated the rupee by a few paisas whenever needed. From 1993 onwards these depreciations—or technical adjustments as the State Bank called them—were supplemented by direct devaluation. However, since 2000, the State Bank has managed the rate differently through other mechanisms, rather than through direct devaluation and the rate stabilized for some years and even appreciated. However, while the exchange rate was kept steady in the 2002–08 Musharraf period, after 2008, for numerous reasons, the rupee/dollar rate saw a significant deterioration. In the 2008–13 period, the rupee depreciated by as much as 37 per cent, from Rs. 61.7 to Rs. 98.15. In the 2002–08 period the rupee/dollar rate changed only from Rs. 60.09 in 2002, to Rs. 61.76 in early 2008 when the PPP government took over—see Chapter 18 for further discussion.

How much devaluation is enough? What should be the 'correct' rate for the rupee/dollar? Many analysts feel that the Pakistani rupee has always been and continues to be overvalued, and hence Pakistan's exports are overpriced and uncompetitive compared to its competitors. They would prefer to see a substantial devaluation of the rupee at frequent intervals. Different reasons are given for this constant adjustment, some quite irresponsible (see Appendix 9.2). Nevertheless, despite the argument made repeatedly that

Table 9.17

Pakistan's exports are inelastic (i.e. their quantity will not rise substantially even if there were some devaluation: see the first article in Appendix 9.2), the rupee has continuously lost value against foreign currencies. This may not be the best way to increase exports. Structural factors, including better-quality products, credit, and infrastructure, may be the key with which Pakistan can open the door to more and better exports. The net result of a falling rupee is likely to be highly negative.

Table 9.17 shows a continuous trend of depreciation each year since 1982/3, with the rupee losing considerable value in some years compared to the year previously. It lost 17 per cent in 1996/7 compared to the value in 1995/6 and again nearly 16 per cent in 1998/9 over the previous year. It has lost value every single year since 1982, with the exception of 2002/3 and 2003/4. In both these years, the rupee had *appreciated* in value against the US dollar bucking the earlier trend. The reasons for this are discussed in greater detail in Chapter 18 where we examine events and developments since 1998. Numerous factors and events have taken place since then which have had a bearing on Pakistan's economy in an important way, as well as on foreign exchange reserves and on the exchange rate—also see Box 9.6.

9.5 Dealing with Globalization and World Trade Organization (WTO)

9.5.1 Some Political Economy Issues

One of the most remarkable features of the last decade of the twentieth century, which will actually determine the nature of the world, its politics and most certainly its economics, well into this current century, is that of globalization. One cannot escape from this term or from its impact in even remote corners of the globe. The world has 'become smaller', 'one-world', a 'global people', and similar descriptions are defining the new world social and economic global relations. Whether it is the email, the Internet, Facebook, or information beamed through the numerous satellites on the thousands of global and regional news channels across the world, relaying live information embedded somewhere or the other, an interconnected world is a reality.

As a description, globalization refers to the widening and deepening of the international flows of trade, capital, technology, and information within a single global market. Globalization is a complex of changes produced by the dynamics of *capitalist development*—and this is important—as well as the diffusion of cultural practices associated with this development. As a prescription, those who believe that globalization will produce the best outcome for growth and human welfare, advocate the liberalization and opening up of national and global markets in the belief that the flow of trade and information will increase welfare.

In order to advance this agenda of capitalism on a global scale, or "globalization", multinational corporations have taken the lead, with multilateral organizations like the IMF, World Bank, WTO and even the UN, supporting

Box 9.6

Has Pakistan's Substantial Devaluation Increased Exports?

The general argument put forward for devaluation is that it should make our exportable commodities cheaper in the international market, in absolute terms and also compared to our competitors, and should so increase exports. The downside is that as the currency depreciates, imports also become more expensive and can cause inflation and costs to rise if a country devalues. While Tables 9.1–9.3 (in the text) show Pakistan's trade figures, Table 9.17 shows the extent of the rupee devaluation. Since 1982/3 the rupee has depreciated by nearly 500 per cent, from Rs. 9.90 to one US dollar to nearly Rs. 60 today. Clearly, exports have not risen a fraction as much.

While Pakistan's main exports have increased both in terms of volume and in terms of value, this increase has been very small compared to the fall in the value of the rupee. One reason for this is that most of Pakistan's exports are textiles and textiles still face a regime of quotas. Hence, no matter by how much the rupee depreciates compared to Pakistan's competitors in this market, Pakistan's textile exports will increase only up to the permitted quota ceiling. Hence, analysing the overall export trend in the 1990s on the basis of *volumes* exported rather than by receipts in US dollar terms, provides support to skepticism about the benefits to exports from the continual and heavy adjustments undertaken. Perhaps non-price factors, like quality, have a more important bearing on boosting factors.

There is also an interesting *moral hazard* problem involved here. The continued devaluation of the rupee may actually *retard* Pakistan's move into value-added textiles, by insulating the margins of producers of low value-added goods such as yarn and grey cloth over an extended period of time. By making windfall gains on account of a depreciating rupee, the textile industry may avoid making the required capital investment decisions to moving up the value ladder.

While exports have not grown by as much as the depreciation would have warranted, there have also been substantial import and related costs on account of this depreciation.

Having had to service a great deal of extra debt throughout the 1990s, increased devaluation raises the rupee cost for conversion of the dollar. For example, in 1995/6 external debt servicing grew by 0.5 per cent in US dollar terms, the total interest and principal payments increased by 15.5 per cent in rupee terms. In 1997/8, while debt servicing in US dollar terms was lower by over 8 per cent year on year, the rupee costs were *higher* by 17.2 per cent on account of a weaker rupee.

Two other factors associated with a cheaper rupee in the case of Pakistan, have been higher imported inflation with increases in domestic oil and petroleum, and hence, electricity prices, throughout the 1990s, and the phenomenon of 'dollarization'. Industrial electricity tariffs increased by 85 per cent in the period 1993–2000, while furnace oil's price rose by 292 per cent—both partly due to devaluation, although other factors were also responsible. *Dollarization* in Pakistan's context, seen for much of the 1990s, has been the buying of dollars in the open market *expecting* the rupee to devalue further and consistently, making profits by this conversion. With a depreciating rupee, the *expectation* that it will depreciate further, will cause it to do so as people push up the rate while buying dollars.

It seems that the costs associated with a depreciation of the rupee are *significant* while the benefits are *uncertain*.

this agenda by preparing the ground for corporations to make headway into the expanding global market. The International Financial Institutions (IFIs) have established an institutional framework for a process of development and free international trade. Structural Adjustment Programmes—see Part VI of this book—led to a new 'enabling policy framework' with the 'liberalization' and opening up of economies where restrictions and government interventions have been increasingly done away with opening the doors to global capital. With IFIs and large corporations, along with of course, political actors as well,[75] determining the economic and political agenda of countries, the powers of the nation-state have been significantly eroded, giving way to the influence of international institutions. As a result, the power of the state has been drastically reduced and it is less able to regulate and make policies pertinent to its own country. The Keynesian welfare state or the strong developmentalist state of the late twentieth century, able to determine national policy over vital economic and social life, has been waning.

Now, external and non-elected officials—of the IMF, World Bank, other donors—play a major role in shaping macroeconomic and social decisions that affect the basic structure of the economy and living standards of nations. Today, in many parts of the world—including Pakistan, as Part VI of this book shows—officials from these agencies decide on government spending, property relations (private versus public ownership), development strategies and many other decisive aspects of social existence bypassing the electoral system of countries. These global agencies have usurped power from states and local governments and have deprived the state of the nation's sovereignty.

There have also been countries which have restricted the role of IFIs while still being major players—and beneficiaries—of globalization. India and Malaysia come to mind, where both are growing global players, yet they have set their own terms in negotiations with the transworld governance agencies, and have prospered as a result. What seems to play a key role in determining the country's ability to take on these IFIs, is an

active and political civil society and political groups (as in India) and/or strong nationalistic leadership (as in Malaysia). Pakistan, sadly, has neither.

Trade, one of the key instruments of globalization, does have a great number of benefits and many of the East Asian countries including China, have prospered on account of this globalization. India, too, in recent years has benefitted on account of the information technology boom exporting software and other services. With world travel and communications increasing and improving, tourism in many parts of the world has emerged as an important earner of foreign exchange. There has been some transfer of technology to countries where multinational corporations have shifted manufacturing, as in the case of Mexico, so as to cut costs. Those countries which have had a highly skilled and educated workforce have benefitted far more than those countries where skill and literacy levels are low. Also, more peaceful, less corrupt, and perhaps more democratic countries, may have prospered more on account of globalization than countries like Pakistan which has neither been peaceful nor democratic. One must not forget either, that globalization, particularly of capital—hot money—has had a devastating effect on many countries in the 1990s—Mexico, Argentina, and countries in East Asia.

One of the major objections to globalization by demonstrators in Seattle, Prague, Bangkok, and other sites has been that it is an unfair system in an unequal world. There is no 'level playing field', and developed countries, particularly the US, European Union, and Japan, determine the rules of the game. In many cases, the rules and regulations that these Big Three along with the IFIs, enforce on underdeveloped countries, are not followed through in their own countries. The IFIs and these countries insist that subsidies to different sectors in underdeveloped countries and protection or special privileges be done away with, yet fail to follow suit. Economist Joseph Stiglitz who won the Nobel Prize reveals the extent of these subsidies in Europe and the US and says: subsidies in advanced countries exceed the total income of sub-Saharan Africa—around *$1 billion a day*! the average European subsidy per cow matches the $2 per day poverty level on which billions of people barely subsist; and, America's $4 billion cotton subsidies to a mere 25,000 well-off farmers brings misery to 10 million African farmers.[76] On average, it has been estimated that the prices these farmers receive for their output are 31 per cent above what they will get in international trade. Farmers receive 80 per cent higher prices for milk, 100 per cent more on sugar, and 360 per cent for rice, all behind high tariff walls. So much for free trade. Undoubtedly, not a level playing field (see Box 9.7).

There is no way one can escape globalization, and perhaps there is no need either. Globalization has led to deindustrialization in some countries as well as increased capital formation in others. Exports have increased in some, while imports due to lower tariffs have increased in others. The domestic economic, social—particularly education, skill, and infrastructure—and political arrangements (civil and governmental) determine how individual countries negotiate and benefit from globalization (also see Box 9.8).

9.5.2 Globalization and WTO's Impact on Pakistan

Much of Part VI of this book, on structural adjustment, and many of the chapters elsewhere, is on Pakistan's interaction with globalization in the guise of the IFIs mentioned above. Without a doubt, the impact of globalization on Pakistan's economy, has been significant, both positive as well as negative. Even in the case of the industrial sector as we show (Chapter 7), the economy has been affected since 1988 by following policies of liberalization, a key component of globalization. Although Pakistan's economy has been far more open and more liberal, and for longer, than most others—compared to India, for example—it has since 1988 reached a higher plane altogether. Since this theme has been discussed in numerous contexts in this book, in this section we merely look at some important aspects which affect Pakistan's economy under the guise of globalization and as a consequence of the World Trade Organization agreements which came into existence after 2005—the WTO came into existence in 1995.

Pakistan, like all countries of the world, has implemented the provisions of the World Trade Organization guidelines and agreements. Trade and industrial sectors have undergone radical change in compliance, first with the Structural Adjustment Programmes of the IMF and World Bank, and more recently, in compliance with GATT and WTO rules and regulations. These rules provide a legal framework for international commerce and there are various protocols which affect different sectors.

Countries were required to improve access to foreign goods and markets by reducing/eliminating tariffs and abolishing quotas. In addition, subsidies both on exports, credit, and on domestic goods—as we argue in the section above—were to be eliminated and countervailing and anti-dumping measures taken. Let us see how these measures have affected Pakistan's textiles, which constitute more than 60 per cent of its exports—also see Chapter 8 Section 8.3, for far more details on the Textile Industry.

International trade in textiles and clothing has been subject to quantitative restrictions in industrial countries. Historically, these restrictions were governed by the Multi Fibre Agreement (MFA) which started in 1974 and was last extended up to 31 December 1994. Following the Uruguay Round of multilateral trade negotiations (1986–1994), the WTO Agreement on Textiles and Clothing (ATC) came into force from 1 January 1995. It envisaged a transitional period of ten years till 31 December 2004 by when the MFA restrictions on textiles and clothing were phased out in four phases. From 1 January 2005, the entire textiles and clothing sector was integrated with General Agreement on Tariffs and Trade (GATT) 1994 and all restrictions on imports of textiles by any of the WTO members, were to have come to an end, opening up the textiles sector on the basis of a 'free' market and 'free' movement of goods and services. The ATC principle, in essence was to remove all quantitative restrictions by industrial countries on imports of textiles and clothing from all countries, allowing far greater access to exports from developing countries such as Pakistan, bringing in a new,

Box 9.7

Globalization and its Discontents

Nobel Prize winner for Economics in 2001, Professor Joseph Stiglitz, has been a critic of the way globalization has taken place and the way it has been made use of by developed countries. Some excerpts from his writings.

> The critics of globalization accuse Western countries of hypocrisy, and the critics are right. The Western countries have pushed poor countries to eliminate trade barriers, but kept up their own barriers, preventing developing countries from exporting their agricultural products and so depriving them of desperately needed export income. The United States was, of course, one of the prime culprits. . . .
>
> But even when not guilty of hypocrisy, the West has driven the globalization agenda, ensuring that it garners a disproportionate share of the benefits, at the expense of the developing world. It was not just that the more advanced industrial countries declined to open up their markets to the goods of the developing countries—for instance, keeping their quotas on a multitude of goods from textiles to sugar—while insisting that those countries open up their markets to the goods of the wealthier countries; it was not just that the more advanced industrial countries continued to subsidize agriculture, making it difficult for the developing countries to compete, while insisting that the developing countries eliminate their subsidies on industrial goods. Looking at the 'terms of trade'—the prices which developed and less developed countries get for the products they produce—after the last trade agreement in 1995 (the eighth), the *net* effect was to lower the prices some of the poorest countries in the world received relative to what they paid for their imports. The result was that some of the poorest countries in the world were actually made worse off.
>
> Western banks benefitted from the loosening of capital market controls in Latin America and Asia, but those regions suffered when inflows of speculative hot money (money that comes into and out of a country, often overnight, often little more than betting on whether a currency is going to appreciate or depreciate) that had poured into countries suddenly reversed. The abrupt outflow of money left behind collapsed currencies and weakened banking systems. The Uruguay Round also strengthened intellectual property rights. American and other Western drug companies could now stop drug companies in India and Brazil from 'stealing' their intellectual property. But these drug companies in the developing world were making these life-saving drugs available to their citizens at a fraction of the price at which the drugs were sold by the Western drug companies. . . .
>
> Not only in trade liberalization but in every other aspect of globalization even seemingly well-intentioned efforts have often backfired. When projects, whether agriculture or infrastructure, recommended by the West, designed with the advice of Western advisers, and financed by the World Bank or others have failed, unless there is some form of debt forgiveness, the poor people in the developing world still must repay the loans.
>
> If, in too many instances, the benefits of globalization have been less than its advocates claim, the price paid has been greater, as the environment has been destroyed, as political processes have been corrupted, and as the rapid pace of change has not allowed countries time for cultural adaptation. The crises that have brought in their wake massive unemployment have, in turn, been followed by long-term problems of social dissolution—from urban violence in Latin America to ethnic conflicts in other parts of the world, such as Indonesia.

forceful, era of global competition. It was felt that the new regime would have a significant impact on countries which were enjoying secured market access which they would no longer have; on the other hand, countries which were being constrained by quotas would now be able to enhance market access under the new, 'free', regime (also see Box 9.9). The quota regime was expected to be over, once and for all.

Before we see how this has had an impact on Pakistan, let us briefly look at what the old regime of restrictions and reforms was like. First of all, the incidence of protection in industrialized countries for textile and clothing has been much higher than other manufactured products. On average, these tariffs were three or four *times* those on other manufactured products, with tariffs increasing with each stage of processing.[77] Average tariffs on fibres were about 1 per cent, while on clothing often more than 20 per cent.

Musleh-ud-Din and Kalbe Abbas present a very interesting analysis of what the earlier MFA tariff and quantitative regime was doing. They argue that the MFA had restricted potential imports into major industrial markets and that growth in volume of textiles and clothing exports of developing countries had been slower because of the agreement. They make numerous important points and say: 'Countries that are efficient producers of textile and clothing products have been particularly vulnerable to the imposition or tightening of MFA quotas. . . . Other effects of the MFA include trade diversion to less restricted countries away from competitive suppliers. . . . The rigidities of the quota system under the MFA have also enabled traditional suppliers to maintain their market shares despite declining competitiveness, and thus have prevented more efficient new entrants from competing on equal terms'.[78]

Box 9.8

Trade Liberalization and the Indian Industry: Some Illustrations of Adverse Impact

The liberalization of trade regime over the past years has sparked off the process of efficiency-seeking restructuring of the Indian industry. In the process a number of industries have also been adversely affected. In particular, the recent phase out of the QRs has affected adversely a large number of small-scale industries that manufacture items reserved for small-scale units. It has been estimated that about 400,000 small and medium industries have closed down in India due to their inability to face competition from imports. The Strategic Management Group in the PMO has apparently identified 45 product groups whose imports have increased sharply following the liberalization. The government is taking action to safeguard the country's interests wherever necessary.

Some illustrative cases of surging imports adversely affecting the local industry are noted below.

- *Watches and clocks*: Unable to face competition from cheaper imports, a number of well established manufactures have closed down. These include Jaina Time Industries, Bifora, Allwyn, Timestar, and Action. Ajanta is shifting production to China.
- *Electrical fittings and other household electrical goods*: Owing to a sharp increase in cheaper Chinese goods, over 300 factories making electrical goods have reportedly closed down.
- *Toys*: Imports of Chinese toys that are cheap, have wide variety, and better quality have critically affected the Indian toys industry. Many units have closed down, some are working at much lower capacity utilization than earlier. Many of the toys manufacturers have turned traders dealing in Chinese toys.
- *Dry and lead acid batteries*: Chinese dry batteries cost a fraction of locally produced ones. Similarly lead acid batteries imports from Bangladesh are cheaper than the cost of materials going into them. Obviously the local manufacturers of these have been hit.
- *Acrylic fibre, yarn and PP/HDPE woven fabric*: Taking advantage of free trade agreement with India, Nepal has captured 12 per cent of India's acrylic yarn market. Acrylic fibre imports from Nepal have increased from just 2,500 tonnes in 1997 to 12,000 tonnes in 2000. About 1,000 tonnes of woven PP/HDPE fabric sacks is also coming from Nepal every month that is about 40 per cent cheaper than (locally produced one. JK Synthetics has downed shutters while Indian Acrylics, IPCL, Pashupati Acrylon, Vardhman Acrylics and Consolidated Fibre & Chemicals are cutting capacity utilization.
- *Banaspati and edible oils*: Nepalese manufacturers import edible oils from Malaysia at negligible duties, process them into vanaspati and export it to India which works out to be at least Rs. 4 per kg cheaper than the locally produced one. Capacity utilization of Indian units has been reduced to 25 per cent.
- *Copper wire rods*: An estimated 32,000 tonnes of copper in various forms is entering India from Nepal where the duty rate on it is low at 5 per cent (compared to 38.5 per cent in India). It is affecting the local producers, viz. Birla Copper, Hindustan Copper, and Sterlite [Industries (India) Ltd.] in terms of their capacity utilization.

The Pakistan government loosened government controls on cotton exports under WTO commitments. The All Pakistan Textile Manufacturers Association (APTMA) argued that the unrestricted export of cotton would deprive the spinning industry of raw material and push up production costs to uneconomic levels. Since most countries have removed trade barriers (i.e. import restrictions) and as quotas were removed from other garment and made-up producing countries as well, it was anticipated that there would be greater demand for Pakistani yarn and fabric and therefore, there would be even less cotton available for local producers. According to WTO rules, the government is not in a position to intervene either in terms of discouraging exports of cotton, yarn, or fabrics, or provide subsidies to garments and made-up exports. The fear that textile manufacturers had was that their industry would suffer and Pakistan would lose out on valuable exports. However, it is was also considered possible that farmers, or at least owners of large land on which cotton is grown, would benefit by access to the free market.

One argument put forward by many Pakistani policymakers and industrialists at that time, was that after 2005 when a quota-free world takes over, Pakistan's main exports, textiles, would get a huge boost as there would be an increase in Pakistan's exports not restricted to quotas as it was earlier. On the face of it, this argument made a lot of sense, after all, the argument went, developed countries earlier bought only a certain amount of Pakistan's textiles constrained by set quotas. In addition, there were those in Pakistan who argued that quotas in Pakistan were being sold at a premium in the black market since there was perceived to be a shortage of quotas, and this premium was borne as an additional cost to textile exporters and in some cases was considered to constitute a major part of the exported item's price. Both these factors suggested that Pakistan's textiles would increase as one element of costs would fall and there would be greater demand. But, this is only one side of the picture.

First of all, Pakistan is not the only country which has had quota restrictions removed—all countries, including Pakistan's main competitors China, India and Turkey, can sell as much as they possibly can. In fact, one argument was made that Pakistan should be grateful for the existence of a quota regime because it limits imports from competitors

Figure 9.2

Positive and negative values denote depreciation and appreciation, respectively.

like China and India, and allows at least some Pakistani textiles to get through. A quota-free regime meant increased competition and only the best and cheapest products would compete and sell. There was no guarantee that Pakistan could meet the new standards and one was not in a position in 2005, before the lifting of quotas, to say for sure that Pakistan's exports would increase; they could also have fallen (also see Appendix 9.3).

There were dozens, if not scores, of studies which looked at the anticipated impact of the fuller imposition of WTO rules and agreements on Pakistan, and a large majority warned that globalization and further expansion of the WTO umbrella would have a very negative impact on Pakistan's main exports. This has clearly not been the case and Pakistan's textile exports have expanded, given the constraints and issues mentioned in an earlier section. Imports have certainly increased a great deal, including of consumer goods, but as we argue above, the main commodities imported into Pakistan, have not been luxury items or consumer goods, but industrial raw material and, of course, petroleum products. There has not been much research after 2005 on the impact of globalization and WTO rules on Pakistan's exports, but impressions and evidence suggests that perhaps the impact may not have been as devastating as many feared. The world seems to have benefitted from economic globalization, although there are serious negative consequences, both of a political and economic nature—see Appendix 9.3 and 9.4. Moreover, it is also clear, that developed countries still have the power and dominance in a highly unequal world, to impose quota restrictions and construct other barriers which restrict imports from developing countries. While tariff and quantity restrictions have been somewhat done away with under the WTO regime, new forms of non-tariff barriers have been imposed. Sanitary and environmental standards have been imposed, as they were some years ago in the case of Pakistan's surgical goods exports. Social barriers or those pertaining to child labour or other kinds of restrictions can circumvent the no-barriers provision. Political, rather than economic or trade-related, factors have come to dominate the new, free trade, world order—see Appendix 9.4. Also see Box 9.10 for how Pakistan's exports have failed to diversify while other countries have shifted to higher value added products.

9.6 Summary and Further Reading

9.6.1 Summary

Pakistan's trade pattern has changed dramatically since 1947. From being a primary goods exporter, Pakistan now exports primarily manufactured and semi-manufactured commodities. However, its exports are still critically dependent on cotton, which contributes around 65 per cent to exports. From about 11 per cent of GDP in 1947, exports and imports together now amount to around 35 per cent of GDP. Remittances have played an important role in Pakistan's economy since the late 1970s, and once provided as much as 10 per cent of GDP; their role has since diminished, albeit is still considerable and they now usually account for around 6 per cent of GDP.

The rupee has depreciated markedly in the last many years, since the exchange rate was Rs. 9.9 to one US dollar. Since it was allowed a managed float, the annual devaluation of the rupee has been, on average, 8 per cent a year, fluctuating between 2 per cent in one year, and as much as 16 or 17 per cent in another year. Given the nature of Pakistan's macroeconomy, its inflation rate, fiscal deficit, and adherence to the Structural Adjustment Programme, one can expect a continuous drift in the value of the Pakistani rupee into the future.

Box 9.9

Agreement on Textiles and Clothing (ATC) and South Asian Textiles and Garments Exports: A Case Study of Pakistan

Developing countries and, in particular, the South Asian countries have a comparative advantage in textiles and clothing. However, their exports of textiles and clothing have been subject to a high degree of protectionist treatment. Developed countries have been following a restrictive trade regime of high tariffs and non-tariff barriers in relation to the textiles and clothing industry. The Multi-Fibre Agreement (MFA allotted quotas to regulate imports of textiles and clothing into developed countries from developing countries. MFA applies to 80 per cent of the world textile and clothing exports, with around 40 participants and 100 bilateral restraint agreements. MFA quotas have thus led to a loss in the export earnings of developing countries.

MFA was aimed at providing 'temporary' protection to developed countries' home industries and at providing 'orderly' access to developing countries entering the developed country markets. Moreover, prior to the Uruguay Round, the tariffs on textiles and clothing averaged 18 per cent for developed countries compared to 6 per cent for other manufactured products. These tariffs also increase with the value-addition, being 1 per cent on fibres and 20 per cent on clothing.

As per the WTO Agreement on Textiles and Clothing (ATC), MFA in textiles and clothing is to be phased out in four steps within 10 years starting from 1 January 1995. As a part of the implementation of ATC, the developed countries will have to eliminate these quotas, even though it is back-loaded with most of the liberalization to be carried out at the end of the period. This leaves room for discretion in their phase-out schedules. The Agreement requires that importing countries should include at least one product from each of the four groups—tops and yarns, fabrics, made-up textiles, and clothing—to make the transition more even. The Agreement also has transitional safeguards for unexpected surges in imports which are not yet integrated into the GATT framework. However, keeping in mind the interests of developing countries, these safeguards can only be applied selectively and for a maximum of 3 years. ATC also provides for a reduction of 22 per cent in industrial countries' bound tariffs. This will reduce the proportion of developed country imports subjected to peak tariffs from 35 per cent of the pre-Uruguay Round to 28 per cent. This is much lower than the proportional tariff cuts in bound tariffs which are applicable for the other industrial products.

Thus, it is clear that implementation of ATC offers great potential to developing countries for an increase in their exports of textiles and clothing. However, it also poses a challenge: With the elimination of quotas, the South Asian countries will be competing freely with other countries, some of which might be more competitive. Hence, the South Asian countries may lose their market share unless adequate steps are taken to strengthen their competitiveness. In this context, Pakistan's case study is illustrative.

The textiles and clothing sector in Pakistan is an important segment of the economy. It accounts for 8 per cent of GDP and 30 per cent of the value-added and 40 per cent of the labour force in the manufacturing sector, and over 75 per cent of merchandise exports. The rapid expansion of the industry has been facilitated by the availability of raw cotton and cheap labour. While the number of spindles doubled from 3,226 to 8,356 between 1972–73 and 1998–99, the number of looms actually fell by half from 29 to 10 over the same period.

Pakistan's textiles and clothing are exported largely to the western countries. North America is a major market and accounts for more than 50 per cent of the exports of hosiery, towels, and made-ups. Similarly, about 49 per cent of the readymade garments are exported to the United States and Canada. Next comes Europe in the export of cotton fabrics, ready-made garments, hosiery, towels and made-ups. Asia accounts for 66.36 per cent of the cotton yarn exports.

The phase-out of MFA quotas under ATC poses a big challenge of the industry and has critical dimensions for the economy and its export earnings. It requires the country to take steps to improve, consolidate and strengthen its competitiveness by improving efficiency. Pakistan does have the traditional advantage in raw cotton availability but has not yet exploited it to the maximum potential. The low level of MFA quotas being used show that all is not well with the domestic textile sector. Some of the challenges faced by the Pakistani textiles and clothing industry are as follows:

- There is a need to improve quality standards of all its textiles from raw cotton to finished products. Efforts have to be made at improving the quality of domestic cotton through greater R&D so as to develop superior varieties of long staple cotton.
- The industry should diversify its base from cotton products to synthetics to take into account the consumption pattern of the major export markets. There is a growing market for manmade fibre and products which should be tapped by increasing the production capacity of synthetic blends.
- The main focus of attention should be value-addition instead of intermediate and raw products. This requires a strong and modern weaving and processing base with a vertical integration of textile units.
- Efficient utilization of resources as well as increasing the productivity and efficiency of the industry.

Besides steps taken at the domestic level, intra-regional co-ordination based on specialization and vertical integration among the South Asian countries may help in strengthening the competitiveness of their exports of textiles and garments by enabling them to benefit from economies of specialization and scale.

Box 9.10

Pakistan's Falling Exports and Rising Exports of Other Developing Countries

While Pakistan's exports have stagnated over the years and have been stuck in a singularly textile mode, other countries in the region have performed far better. The *Fourth Annual Report* of the Institute of Public Policy, Beaconhouse National University, Lahore, brings this point out clearly.

Over time Pakistan has steadily lost ground in manufactured exports to all other major developing countries: its share in this group was 1.4 per cent in 1980 but had fallen to 0.4 per cent by 2008. Even excluding China, Pakistan's share has dropped more than 50 per cent to 0.4 per cent over 1980–2008 (see Table 1). There are three main factors for this relative decline and missed opportunities. First, Pakistan remains heavily dependent on relatively slow growing textile exports—it has also made less headway in faster expanding garment exports. Secondly, since 2005, it has lost market share in both textiles and clothing not only to China but also to emerging important exporters like India, Turkey, and Vietnam. (see Table 2) Third, its record in fast expanding other manufactured exports whether sports goods, surgical equipment, automotive parts, or jewellery has been dismal and its presence in international markets is negligible. Pakistan missed out on purely non-cotton textiles in the 60s due to its restrictions and high import duties on inputs for mixed or synthetic textiles. It missed on electronics in the 60s and 70s and information technology in the 1990s. Lack of structural changes has been responsible for slow growth as well as low value added in exports.

There is some satisfaction that textile and clothing exports at the annual rate of $12.5 billion in July–December 2010 showed an improvement of over 25 per cent over the corresponding period last year. But this represents largely a recovery from the low level in 2009. More importantly, a significant part of the improvement is due to the much higher prices of cotton and cotton goods in recent months.

How far we have fallen in the export field, compared to some of our peers and competitors, is also clear from Table 3 on the trend in exports of goods and services and the share of exports in GDP. Just three decades ago, Pakistan had greater export orientation than any of the countries in the table. Now, even the two continental economies, India and China, have a much larger export sector than Pakistan. Turkey, an inward looking economy in 1980, has transformed itself.

Vietnam a new comer to the export field is now far ahead of Pakistan in just a couple of decades. In real terms, adjusted for rise in international prices, Pakistan's exports are estimated to have grown by an average of 4.5 per cent per annum since 1980 compared to 9 per cent annual growth in India—certainly not a stellar performer in the export field.

As a late comer to the field of manufactured exports, except in textiles and clothing, Pakistan faces formidable challenges. But, there are several grounds of optimism. First, Pakistan's market share in the world manufactured goods other than textiles and clothing is miniscule. Secondly, though right now Pakistan is not very competitive in textiles and clothing, the room for productive improvements is immense provided the right investments in modernizing industry and upgrading skills are made with the help of foreign partners. Pakistan should look for help to China as well as countries like South Korea, Malaysia, Turkey, and Hong Kong that increasingly face limits on their textile and clothing exports because of rising wage costs. Thirdly, proximity to China and India, the two fastest growing markets in the world, offer great long-term potential though right now there are political obstacles in the way of expanding trade with India, and Pakistan actually has a large trade deficit with China. Finally, the potential of agricultural exports has not even begun to be explored seriously.

Table 1
World manufactured exports and major developing countries' market share

	US$ Billion		Market Share (%)		
	1980	2008	1980	2005	2008

Just as the industrial policy of the early years was maligned for causing inefficiencies in the economy, so too was trade policy. The same reasons were given for distortions being caused in the structure of the economy by trade policy, as were alleged to have resulted from industrial policy. However, this chapter, reviewing the work of some scholars, has argued that many of the so called distortions had export-enhancing impacts, and that these measures were productive. The Bonus Voucher Scheme of the 1960s, in particular, was singled out as a mechanism that caused serious distortions in the economy. However, as this chapter has shown, the scheme was conducive to promoting industrialization and exports.

Pakistan's trade pattern and trade policy have continuously been moving towards fewer and fewer controls, lower tariffs, and more openness. Non-tariff barriers have been replaced by tariffs, and tariff rates have come tumbling down. Since 1988, as per the agreement with the IMF and the World Bank under the Structural Adjustment Programme, a 'liberal' import policy has been pursued, with lower tariff rates and fewer tariff slabs, along with a persistent 'readjustment' of the Pakistani rupee. Despite the substantial devaluation that has taken place, Pakistan's exports have not responded as one would have hoped.

Export-led growth is considered to be a key ingredient in economic development as the much-cited East Asian miracle suggests. However, the important factor overlooked by Pakistan's policymakers is that the supply-side incentives—prices, inputs, tax incentives, etc.—do not help exports as much as removing structural weaknesses. Quality control, the provision of infrastructure like communications and energy, and direct incentives to exporters are all necessary to ensure that exports increase to an extent where they contribute extensively to economic development. To do that, Pakistan requires an export bias in policy, a fact that has been ignored for most years.

9.6.2 Further Reading

Since industrialization and trade are so closely linked, many of the references given in Chapters 6–8 should also be studied to understand how trade influenced industrialization in Pakistan. On Pakistan's trade: Adams, Adams and Sabiha Iqbal, *Export Politics and Economic Development in Pakistan* (Lahore: Vanguard, 1987); see also Viqar Ahmed and Rashid Amjad's *The Management of Pakistan's Economy, 1947–82* (Karachi: Oxford University Press, 1984). Some references in the Notes will also be useful for additional reading on trade.

Appendix 9.1

The World Trade Organization

The following is an edited extract from a report by the Export Promotion Bureau in 1995.

> It all began in the Latin American resort town of Punta del Este, Uruguay. And it seemingly ended in Marrakesh in April 1994. Seemingly, because now is the real beginning of the outcome of the talks that commenced in Uruguay in 1986.
>
> On 1 January 1995, a new organization came into existence—the World Trade Organization (WTO). This new organization replaces the General Agreement on Tariffs and Trade (GATT) and will supervise and oversee the most ambitious global trade accord ever.
>
> What is this GATT accord and how is this likely to affect Pakistan's exports?
>
> The Uruguay Round of trade talks ended with the signing of an accord that is about 500 pages long which contains resolutions that affect a wide variety of subjects both directly and indirectly.
>
> The signing of this accord could allow Citibank to open more branches in Pakistan. It could result in the closing up of thousands of factories across the country because of accusations of environmental pollution. It could reverse our efforts to make Pakistanis computer literate. It could threaten our carpet exports because of social dumping. It could rake in profits for our garment and footwear exporters. The list goes on.
>
> But like all agreements, the WTO Agreement has its loopholes and provisos, its qualifications and conditions and its Schedule of Commitment which can help protect infant industries and restrict market access.
>
> So, did the Marrakesh Agreement achieve nothing more than a 'new and improved' label? The answer depends on how the world implements the accord.
>
> **Objectives of the WTO Agreement**
>
> > Recognizing that their relations in the field of trade and economic endeavour should be conducted with a view to raising standards of living, ensuring full employment and a large and steadily growing volume of real income and effective demand, and expanding the production of and trade in goods and services, while allowing for the optimal use of the world's resources in accordance with the objective of sustainable development, seeking both to protect and preserve the environment and to enhance the means for doing so in a manner consistent with their respective needs and concerns at different levels of economic development,
> >
> > Recognizing further that there is need for positive efforts designed to ensure that developing countries, and especially the least developed among them, secure a share in the growth in international trade commensurate with the needs of their economic development,
> >
> > Being desirous of contributing to these objectives by entering into reciprocal and mutually advantageous

arrangements directed to the substantial reduction of tariffs and other barriers to trade and to the elimination of discriminatory treatment in international trade relations. . . .

A group of 117 countries agreed on 15 April 1994 to set up a World Trade Organization to implement, administer, operate and further the objectives of the multilateral trade accord.

The basis of the WTO Agreement is the premise that free trade is good for all. By lowering tariffs and quotas the playing field will be levelled and everyone will have the opportunity to compete in a free world market.

Studies have estimated that by removing restrictions, world income is likely to grow by over $200 billion a year by the year 2002. This growth will be shared by all countries, albeit disproportionately—the developing countries are likely to experience slower growth in their income.

Salient features of WTO Agreement

The GATT accord is expected to reduce tariffs around the world by an average of about 40%. This will make consumers happy because prices of imported goods will decrease. It will make exporters glad because reduced prices will stimulate increased demand for their exports. However, developing country industrialists with large excess capacity or inefficient plant and management who were previously protected by prohibitive import duties will have to face price as well as quality competition.

According to the WTO agreement, developed nations which were restricting the import of textiles and clothing have to phase out the Multi-Fibre Arrangement (MFA)—quantitative restrictions on the import of fibre, textiles, and apparel. Quotas are to be totally lifted over a staggered period of ten years. This will mean that Pakistani apparel exporters can sell as many T-shirts in America as US buyers want. However, restrictions on importing T-shirts from India, Bangladesh, and Hong Kong will also be removed and Pakistani shirt exporters will have to be competitively priced.

This agreement has also introduced new patent and copyright protection laws for intellectual property. We will now have to pay top dollars for computer software. Pirated software will be confiscated and destroyed. The computer revolution that is sweeping across developing countries may come to a grinding halt—unless software manufacturers in the West adopt LDC user-friendly pricing policies.

While pirate shops will have to go underground, authorized dealers of computer software and vendors of audio and video cassettes and CDs will experience a massive growth in their sales. The recent introduction of Time-Warner videos in Pakistan shows the tremendous market opportunities available. Even though Time-Warner video rental rates are over 100% higher than those of pirated videos, the introduction of a quality product has been well accepted in the market. Appropriately priced computer software can also take off.

The WTO agreement also addresses the problems of trade in services—including banking and insurance. A country cannot indefinitely limit market access to foreign firms in the service sector based on quantitative restrictions on the number of service suppliers or the total value of service transactions, or the number of service operations. For example, if a foreign bank which already exists in a country applies to open an additional branch, it is seeking market access. If the procedure for licensing of new branches is less onerous for domestic banks than it is for foreign banks, then the country can be accused of discriminatory restrictions.

WTO and tariff reductions

The results of the market access negotiations of the Uruguay Round of talks has been the agreement to reduce tariff rates on non-agricultural goods by about 40%. These rates have been annexed to the agreement in the form of national schedules of concessions.

The tariff reduction programme agreed upon is to be implemented in five equal rate reductions unless otherwise specified by a country. The first such reduction has come into effect on 1 January 1995 and the final rate is to become effective within a period of four years.

Pakistan has been very liberal in its tariff reduction and market access programme and has already announced the reduction in tariffs on several important product categories. On 1 January 1995 Pakistan slashed by 50% the tariff on an item of interest to both the US and Europe—cotton and silk fabrics. Our textile mills will now have to compete with European and US fabrics under protectionist fences that have been lowered from about 70% (plus 15% sales tax) to 35% (plus sales tax).

The government has also committed itself to reducing average tariffs from the current 70% to 45% in 1995–96 and 35% in 1996–97. Used to working under a regime of import restrictions and licensing, Pakistan's industrial sector has numerous inefficient and obsolete factories. The tariff reductions that will come into effect will result in a shake out and inefficient producers will have to shape up or close down.

Tariff reductions and government revenue

Pakistan relies heavily on indirect taxation for government revenue. Import duties and sales tax on imports account for over 40% of total government revenue and a reduction in tariffs is expected to cut heavily into this source of funds. This may exacerbate the budget deficit.

However, the government is banking on the success of its taxation reforms to bridge the gap. First, reduction in import tariffs compounded with restrictions and monitoring of Afghan Transit Trade may result in a reduction in smuggling. More imports will come in through the legal channel thereby generating import duty income for the government. Secondly, introduction of VAT—a broad based General Sales Tax—is likely to increase revenues. And, finally, greater sectoral coverage of income tax through the inclusion of agricultural income in the tax net is expected to yield sufficient revenues to bring down the budget deficit to 3% of GDP by 1996–97. If the political will to enforce all aspects of the tax reforms programme is lacking, we may end up with lower import duty collections and a yawning deficit.

The WTO Agreement and agriculture

The Uruguay Round of talks have deliberated on various aspects of the agricultural sector. This sector is heavily protected not only in developing countries but also in developed countries. Tariffs on agricultural products are to be

reduced by 36% in developed countries, 24% in developing countries. This reduction is to be undertaken over a period of 6 years for the developed countries but over 10 years for developing nations. Least developed countries are not required to reduce their tariffs.

The Japanese rice growers have a powerful lobby that almost managed to disrupt the Uruguay accords by preventing the opening up of the Japanese rice market to foreign competition. However, they later agreed to minimal market access—between 3% to 8% of domestic consumption over a ten-year period.

European Community farmers also work under heavy farm subsidies. Their subsidized output is sold in the domestic market as well as to foreign buyers. Reduction of these farm subsidies may lead to higher international food prices as subsidizers reduce the surplus that they dump overseas. Developing countries that import such food grains will suffer.

Domestic farm support policies that have a limited impact on trade are excluded from reduction commitments. Such policies include government support for research, disease control, food security, and environmental programmes. Other farm support policies which are not exempted will have to be reduced by 20% by developed countries and 13.3% by developing countries (excluding the least developed).

Direct export subsidies on farm products have to be reduced and the total quantity of subsidized exports also has to be limited. However, subsidies to reduce the cost of marketing exports of agricultural exports or inland transport and export freight charges have not been subjected to reduction. This is of significance to Pakistan as we are currently providing a 25% freight subsidy to encourage the export of fresh fruits and vegetables.

Circumvention of the agreement through food aid donations and export credits is to be controlled through certain provisions in the agreement.

As protectionist farm policies supported by strong political lobbying are expected to threaten the accord, the WTO agreement includes an agreement on Sanitary and Phytosanitary Measures. This gives governments the right to control food safety and plant protection but has to be limited to the extent necessary to protect human, animal, or plant life.

Japan's recent removal of the ban on the import of Washington apples from the United States is an example of how this policy could open up markets. What is important is that the countries which have signed up should apply these rules across the board. Succumbing to US pressure, Japan could selectively open its market for agricultural imports but phytosanitary regulations could be enforced to ward off rice imports from Pakistan.

The EC has recently stiffened its import regulations for fruit and vegetables, introducing packaging as well as quality standards. Pesticides and fungicides imported from developed countries are used in the production of fruit and vegetables in developing countries and at times residues of such products constitute grounds for barring entry. With good intentions, the WTO agreement can help resolve these problems. But if nations so desire, they can wield the quality card for discriminating against foreign imports.

An important issue related to agriculture is the protection given to intellectual property rights insofar as they apply to patents for plant varieties and 'breeder's rights'. This could mean that farmers would have to pay royalties for growing crops of a particular type even if they used their own seeds. Such royalty payments could affect the profitability of farmers in developing countries. Indigenous research into plant varieties—especially rice and cotton in Pakistan—should be speeded up to avoid heavy royalty payments.

The WTO Agreement and textile exports

World trade in textiles and clothing is heavily restricted and subjected to quantitative restrictions. The United States and Canada as well as most of Western Europe have shuttered out suppliers of clothing and textiles from Asia, Latin America, and several other regions to protect their own overpaid workers.

One of the major achievements of the Uruguay Round of trade talks is the agreement to phase out the Multi-Fibre Arrangement and put an end to quotas on textiles and clothing. The phasing out of quotas is scheduled to take place over a ten-year period in three phases. The first phase began on 1 January 1995 when the quota imposing countries lifted quotas on several items allowing the free import of a number of textile and clothing products from Pakistan.

According to the agreement, 16% of total 1990 imports of textiles were integrated into the GATT—freed from quotas—on 1 January 1995. These products are from a specific list in the agreement and have to include items from each of the following categories: fibres and yarn, fabrics, textile madeups, and clothing.

On 1 January 1998, in the second phase, an additional 17% of 1990 imports would be integrated followed by a further 18% of 1990 imports on 1 January 2002. All remaining products would be integrated on 1 January 2005.

Between each phase, the level of quotas imposed on the products that remain under restraint is to be reduced by a speedy enhancement of quota limits. According to the MFA, annual growth levels accepted for most categories are about 5–7%. These are to be increased by 16% in Phase I, by 25% during Phase II and by 27% in Phase III. This means that a product that remains under quotas for the entire duration of the ten-year phasing out period will have its quota level enhanced by 5.8% every year between 1995–98 from the existing level of 5%. In Phase II (1998–2002) the annual growth level will be enhanced to 7.25% and in Phase III (2002–2005) this will increase to 9.2%.

During the initial three years there will be a marginal opening up of the textile and clothing sector. Between 1998–2002 the level of integration will be only 33%. It is only after the seventh year of the accord begins in 2002 that 51% of the textile products under quotas will be freed. The developed countries have, therefore, delayed the opening up of their textile sector to unhindered foreign competition but they have negotiated with developing countries like Pakistan and India to lower tariff levels on imported fabrics and textile products. In fact, Pakistan has already agreed to allow the import of foreign fabrics and children's garments at a nominal tariff level of 35%. This lowering of the tariff level took effect on 1 January 1995.

Impact of the WTO Agreement on Pakistan's textile exports

Cotton yarn

Pakistan's most significant textile export is cotton yarn which accounts for about a third of all textile exports. Selling yarn has never posed a major problem and greater market access for our yarn will not lead to any significant trade gains. It is the availability of cotton which will determine growth in this sector. If cotton is available in abundant quantity, our textile spinners can convert it into yarn for both domestic sale and export.

The declining cotton crop may lead to increased usage of man-made fibres and poly-cotton yarn. Spinning mills have to be flexible enough to make both types of yarn. Besides, finer counts of yarn will be spun when cotton is not readily available. Both these point towards quality upgradation as a means of increasing export earnings.

Increased exports of textiles and apparel in a quota-free world will increase the demand for cotton yarn and push up prices which have already climbed up from an average of about $1.5 per kg to $2.75 per kg within the last two years.

In 1992-93 and in 1991-92 we doubled our textile spinning machinery imports each successive year and we now have sufficient capacity in our spinning sector to meet our domestic needs and export over $2 billion worth of yarn in 1996-97 (from the current $1.2bn) provided we have a good cotton crop.

The WTO accord may help keep yarn prices up but removal of supply constraints is important to keep our yarn exports going. In six years our yarn exports jumped up in value from $260 million in 1984-85 to $1,183 million in 1990-91. They have only remained stagnant during the last few years due to lack of cotton.

Cotton fabrics and synthetic textiles

Some cotton fabrics and synthetic fabrics are subjected to quota restrictions and it is expected that as soon as quotas are lifted, their exports will grow.

About 30% of our cotton fabrics and 50% of our synthetic textiles go to developed countries and the WTO accord may lead to an initial spurt in exports to these countries. However, increased competition from the Far East may reduce US and European apparel and textile made-up manufacturing and the fabrics being exported by Pakistan may find a bigger and growing market in the Far East or Latin America rather than in Europe or North America.

Quality improvements in the processing of fabrics will be needed to meet competition from the Far East. Colour fast printing and dyeing as well as a quantum leap in the designing of motifs and patterns will be essential for upgrading the quality of our fabric exports. Flawless weaving and strict quality control will also ensure growth of this sector.

Textile made-ups

Bedsheets, towels, and other textile made-ups supplied by Pakistan are among the cheapest in the world—barring China. Exports of most of these items are affected by quotas. The WTO agreement will provide greater market access to our exporters and we should be able to increase our exports of such products.

The current cotton crisis has pushed up the cost of raw material—yarn—for made-ups manufacturers and they are experiencing difficulties in export at their traditional low prices. What is required is that exporters of made-ups should invest in upgrading their marketing skills and cater to the higher level of the market.

Providing institutional linen in bulk—plain white towels and bedlinen—may generate export sales but dyed, embroidered. and appliqued towels fetch prices that are several times greater. Admittedly, they require more marketing efforts but they are the long term saviours. A shipment of cheap towels from China can immediately displace exports from Pakistan but a well-designed and packaged product from Pakistan will not be easily dislodged by foreign competition.

Garments and knitwear

The clothing sector possesses the biggest promise for delivering Pakistan out of the under $10 billion exporters club. Our knitted T-shirts are in great demand in the US and Europe and quotas on the export of T-shirts have been stifling growth in this sector. Once the quotas are removed we should experience a tremendous growth in the demand for a large number of our clothing goods.

However, it is unclear as to when quotas on these items will be reduced. It seems most likely that quotas on major clothing exports will only be lifted in 2005. This will mean that there will be no significant change in our exports of garments and knitwear for the next ten years.

As the phasing out of the MFA involves the lifting of restrictions of different categories during different periods, it is likely that Pakistan's exports of, for example, trousers, will become quota free while export of trousers from India and Hong Kong will continue to remain under quotas. These opportunities have to be seized and efforts have to be made to get our foot in the door as soon as possible.

There will be continued resistance from the West to our clothing exports as is evident from the following statement made by the President of the US Amalgamated Clothing and Textile Workers Union:

> [By signing] the accord without toughening its labour standards, Congress and the administration are putting millions of US jobs at risk by linking the American economy to those of countries that lag dramatically behind America in wages and work standards.
>
> [Supporting this agreement is to] rob children and young adults of their youth. The [WTO] should include mechanisms to enforce internationally recognized workers' rights, including outlawing child labour, and set environmental standards.

If such 'social dumping' or 'environmental dumping' objections are given weightage, the West will continue to have a ploy for limiting our clothing exports.

As it is, the first phase of abolishing quotas has shown that the West is planning to take the harder decisions later. By only abolishing quotas on items such as 'umbrellas' and 'fabrics for

making parachutes', it is obvious that apparel exporters need not celebrate just yet.

Long term prospects for growth in Pakistan's garment and knitwear exports, however, are quite positive. In the last five years, garment exports have grown from $394 million to $613 million while hosiery (knitwear) exports have grown from $274 million to $509 million.

The textile export sector—aided by the Export Promotion Bureau—is making investments in improving fashion designing and upgrading skills in manufacturing by setting up a dozen textile training institutes and a fashion design school. By the time quotas on the export of apparel are lifted, these institutes should have turned out enough trained professionals to meet the quality requirements of an unfettered world of competition.

Leather and leather goods exports

After textiles, leather is the most important sector of Pakistan's exports. Every year, we have been supplying over 15 million sq. metres of leather to the world, of which 3 million sq. metres goes to Italy alone—Italy's famous Gucci shoes may be made of Pakistani leather!

During the last ten years we have also developed our leather garments industry which is now generating exports of $376 million. Our footwear industry is, however, still in its infancy and is expected to take off in the next few years.

The entire leather group today contributes about 4600 million in export earnings. With some marketing and training efforts leather garments exports can grow substantially. Footwear exports can also grow dramatically if import regulations for raw material used in the footwear industry are relaxed. The leather industry has the potential to become a $2 billion export industry within five years if we continue to upgrade skills and also ensure adequate supplies of hides and skins by tapping the Central Asian markets.

Central Asia presents a very large export market for our leather products and is currently catered for by 'tourist-businessmen'. Streamlining the financial and banking arrangements between the region and Pakistan will help boost exports there.

One major problem that looms large for the leather sector is the environmental rules that infiltrate into the WTO. The WTO agreement incorporates an Agreement on Technical Barriers to Trade which covers processing and production methods related to the characteristics of the product itself. If the leather that is being exported by Pakistan is being manufactured in tanneries that spew untreated effluent into the environment, countries can restrict our leather exports.

The leather industry of Pakistan has taken cognizance of this and is already undertaking efforts to minimize ecological damage.

Food exports—rice, fruit and vegetables, and seafood

Last year, when the Japanese government opened up its rice market due to a bad rice crop it was very selective in its policy. Pakistan was unable to get a share of its market. Although we do not produce the glutinous rice that is eaten by the Japanese, we do produce rice which can be used for industrial purposes (making sake and rice noodles). 'Quality considerations' prevented the import of our rice.

The opening up of the rice market in Japan is unlikely to create any major new opportunities for us.

We should be watchful of conditions on 'quality' safeguards that will need to be taken on the export of fruits and vegetables. Traces of pesticides and chemicals—that were sold to Pakistan by the West—are posing as hurdles in our export of produce.

We have to educate our farmers on the proper usage of chemicals and a back-to-basics approach is ideal for green vegetable exports. Proper packaging and temperature controls are also needed to increase our exports of fruits and vegetables.

Fish and seafood exports are also affected by quality standards. Untreated sewage flows into the sea and is polluting our marine environment. Industrial effluents are also being dumped untreated into the sea. These, along with overfishing, have affected our fish catch. Indiscriminate use of fine mesh nets and fishing during the breeding season is reducing our fish population.

These problems need to be addressed if our fish exports are to grow. But what is more important is the quality upgradation that we have to undertake to ensure that we are not subjected to restrictive trade practices.

In early 1994, French fishermen protested against the cheap import of fish from abroad by destroying containers of imported fish. Within weeks of this incident, the French authorities asked the Pakistani government to supply them with a list of exporters of seafood whose fishing and packaging practices conform to the health and hygiene requirements of the EC.

An attempt was apparently made to bow down to domestic pressure by using the subterfuge of quality.

Our seafood exporters generally work in extremely unhygienic conditions. They have to upgrade their facilities to conform to internationally acceptable standards as the sword of quality will be used more and more aggressively in the new, liberated world of trade.

WTO and ISO 9000

When quotas on our textile exports are removed, the world will have another instrument to restrict our exports. This is the ISO 9000 rule, ISO 9000 is a new quality standard that is being espoused by the world to foster good manufacturing practices and quality safeguards in all processes both in the manufacturing and service sectors.

In Pakistan one company has so far been certified to be conforming to ISO 9000 standard—AEG. Unless other manufacturers and exporters join the bandwagon and begin standardization and quality controls, Pakistan's exports will perpetually remain under the ominous threat of quality sanctions.

Appendix 9.2

Devaluation: Arguments For and Against

The following three articles, two written a few days prior to the 28 October 1995 devaluation, one immediately following the 12 September 1996 devaluation, examine the arguments for and against devaluation in Pakistan.

The devaluation dilemma

Business and banking circles in Karachi are abuzz these days with the prospects of an imminent devaluation. Exporters and importers, understandably alert, are hedging their bets as they believe that the Government of Pakistan is about to devalue the rupee substantially. Leading currency analysts in the city, for their part, are also predicting a massive devaluation of the rupee against the US dollar before the end of the year.

These devaluation rumours have been sweeping the market for many weeks and have intensified of late, resulting in a near panic buying of dollars. At the same time, importers have stepped up business considerably in a bid to capitalize on the higher existing exchange rate before imports become more expensive. Even the federal commerce minister, Chaudhry Ahmed Mukhtar, joined the fray a few days ago, revealing that the government intends to devalue the rupee by three per cent by the end of the year. In all this ruckus, the only quarter which has consistently taken a different stance is, in fact, the very institution that is supposed to announce changes in the value of the rupee, the State Bank of Pakistan.

State Bank Governor Yaqub has repeatedly and strongly denied all the rumours and speculation about devaluation, massive or otherwise. With statements ranging from 'no devaluation in the offing' and reports that he has 'ruled out devaluation', to the stronger 'dismissal' of the commerce minister's statement, Governor Yaqub has consistently clung to his claim that devaluation will not take place. Furthermore, he has warned those 'gambling' on a probable devaluation of the rupee to do so 'at their own risk', in the process reminding them of a similar warning issued by him when the government decided to make the rupee convertible in June 1994.

At the time, currency analysts and market players were, as is the case now, expecting a massive downward movement in the rupee and had consequently indulged in 'a pre-1994 budget buying spree to make windfall profits'. In the event, however, the rupee depreciated and adjusted by only 9.3 per cent after the partial convertibility on 1 July 1994. But despite the claims and warnings by the governor that devaluation is nowhere in sight, the fact remains that the rupee has seen as many as nine downward adjustments since the budget was announced on 14 June.

The spot buying rate of the rupee was pegged to the US dollar at 30.97 prior to the budget. The first post-budget downward movement occurred on 28 June, when it lost four paisas and settled at 31.01 rupees. In the 14 weeks from the mid-June budget to the end of September, the nine downward adjustments have resulted in a 58 paisa, or 1.87 per cent, depreciation in the value of the rupee. At the end of September, the spot buying rate of the rupee with respect to the dollar was 31.55. The Governor of the State Bank, for his part, has called this drop a 'corrective adjustment' and not a devaluation.

Bankers and currency analysts, however, are forecasting a substantial devaluation before the end of the year. They predict that the December rupee-dollar parity will be 32 rupees to the dollar at the very minimum, but will most likely be closer to the 33 rupee mark. One analyst believes that the 'most real value for the rupee before the year is out' is a massive 35 rupees to the dollar. Another view, that of a senior banker in a leading US bank, is that the rupee will depreciate by 10–15 per cent by early November. This means that his bank is advising its clients that the dollar will be worth 36.2 rupees in a few weeks, well before the end of the year.

Most analysts give four reasons for the impending devaluation, three of which relate to what are called 'fundamentals'. They believe that there is a need for devaluation because of the continued widening of the trade gap, the fall in foreign exchange reserves and mounting inflationary pressures. The fourth reason is said to be the recent adjustment in the Indian rupee. Not all of these claims are valid.

The trade and current account deficits, for instance, have both been falling over the last few years, not widening. The trade deficit in the last financial year 1994–95 as a percentage of GDP was the lowest since 1980. The current account deficit (as a percentage of GDP) for the last year, meanwhile, was the lowest since 1987 with the exception of 1991-92. The trend for the two deficits, which are very closely related to the exchange rate, has, therefore, been downward. On the other hand, foreign exchange reserves have been rising consistently since 1990, and at the end of the last financial year stood at 2.74 billion dollars, the highest level ever. On these two counts, which reveal important trends related to the exchange rate, currency analysts have got the direction of the movement wrong.

Inflation is the only fundamental on which the analysts are right, but for the wrong reasons. Inflation has been on the rise and has affected what is known as the real exchange rate, which compares the inflation rate in exporting and importing countries. High inflation in one trading country vis-à-vis the other implies a deteriorating real exchange rate, and hence the need to devalue the nominal exchange rate to make our goods more competitive. It is true that Pakistan's inflation rate is higher than that of its trading partners, but devaluation on these grounds would only add fuel to the fire. Devaluation for Pakistan would prove to be inflationary and further worsen an already explosive price situation.

The main reason extended in favour of devaluation is that it will make exports more competitive—that is, cheaper—and thereby increase the volume of exports and foreign exchange earnings. However, even at a theoretical level this is a questionable proposition. Firstly, exports may not be price sensitive and they may respond to non-price factors; as such, lowering the price of exports may not affect volume and

lead to an increase in demand. This very phenomenon was observed in Pakistan after Moeen Qureshi's devaluation two years ago. Often, a J-curve effect is seen, where the balance of trade—the value of exports minus the value of imports—first deteriorates before any improvement is seen. This often produces the knee-jerk reaction of further devaluation and only adds to existing problems.

Also, even if exports do indeed increase, the price of imports will also rise at the same time, and under numerous conditions the effect of devaluation may substantially worsen the balance of trade and negate the entire exercise. Furthermore, after the utter devastation of the Mexican economy following a bungled devaluation nine months ago, foreign investors have become more cautious about such interventions in emerging markets, and local governments are aware of these concerns.

The fourth argument for devaluation is the weakest. The justification in fashion these days is that since the value of the Indian rupee has fallen, or depreciated, to be precise, Pakistan must devalue immediately. Newspaper articles are clamouring that the 'Indian move is an economic invasion to knock out Pakistani exports in the world market'. There are numerous inconsistencies in this claim.

Firstly, Indian goods are not strictly comparable to Pakistani exports and nor are all of them perfect substitutes. Secondly, export orders and contracts are usually signed well in advance, and are based on numerous non-price considerations such as political factors, long-term dealings, practices and ties, institutional factors, tradition, culture and a host of other influences. Thirdly, Indian exports generate almost four times the foreign exchange that Pakistani exports are able to bring in, implying that the Indian market is already more established than Pakistan's. Fourthly, the devaluation seen in the Indian rupee actually took place in the kerb market, where the rupee fell to 35 per dollar for a short while, but then stabilized at around 33.80. The official value of the Indian rupee did not change.

Finally, Indian exports have surged this year, rising by as much as 29 per cent which is a very healthy trend indeed. Essentially, then, a devaluation in the Indian rupee by a few percentage points should not cause concern to our exporters. What matters for us is the US dollar.

Strangely enough, while all currency analysts and traders have been arguing in favour of devaluation, they have not given enough weight to what happens to the US dollar. Pakistan follows a managed float and although there is a basket of currencies to which the rupee is linked, the US dollar is still the key currency. This April the dollar fell to an all time low of one dollar to 80 Japanese yen, and after a 15-month high is now hovering around 100 yen. The US dollar started its upward movement in July and the changes in the dollar–Pakistani rupee rate need to be seen in that context. A stronger US dollar would put pressure on the Pakistani rupee, and hence the need for the 'technical adjustments'.

The key determinant in the next few months for the Pakistani rupee will be the value of the US dollar, not the Indian rupee. Once the dollar stabilizes, so should the rupee. Furthermore, there has been very little adjustment so far this year, mainly because the dollar was weaker, and based on past trends, there is considerable room to manoeuvre.

At the moment the government's most immediate task is to deal with rising inflation, which was 14.8 per cent in August on a year-on-year basis. Devaluation at this point will only fuel inflation without necessarily improving the balance of trade position. Exports showed a healthy trend last year growing by 15.7 per cent with a total value of 7.8 billion dollars. The target for the current fiscal year 1995–96 is 9.2 billion dollars, and if the cotton crop is good, as is very probable, one can expect an increase in exports. The stumbling block for high exports is not the rupee–dollar parity rate, but the anarchic and devastating political situation in Karachi. All attempts at improving the economy and expanding exports must be predicated on finding a quick and just solution to the politics of Karachi.

To this end, the business community should be pressurizing the government to come to terms with the real concerns of the people of this city. In comparison, the whole hype about devaluation as the key to our economic problems will soon fall into perspective.

Walking the exchange rate tightrope

Most governments hate to devalue because in the short-run there are more losers from devaluation than there are gainers. The reason is simple. Imports and locally produced import substitutes become more expensive after devaluation and this affects the consumption basket of a large number of voters. On the other hand, exporters who benefit from devaluation are relatively few and the benefits of export-led income and employment growth come with a lag. So, why did the Governor of the State Bank of Pakistan devalue the rupee last week by 3.65 per cent?

Prudent exchange rate management is a delicate balancing act. Ours is a managed float, whereby the Governor of the State Bank sets the value of the rupee in view of the supply and demand for other currencies. In so doing, he weighs in the fact that the evidence on supply and demand is made murky by speculators. If he misreads the signals, and devalues excessively, the result is inflation and extra debt burden. If he over-values the currency, he risks out-pricing Pakistani exports and under-pricing imports, resulting in a trade deficit.

What should the Governor be guided by? The bazaar value of the rupee–dollar exchange rate and the FEBC premium are usually contaminated by speculation. More reliable guides are domestic and international inflation rates and the fiscal and trade deficits. Inflation in Pakistan, currently running at 13–14 per cent, is considerably higher than the trading partners' inflation of around 4 per cent. This suggests an appreciation of the real exchange rate, which requires a devaluation of the nominal exchange rate (real exchange rate is the nominal exchange rate times relative inflation; if the latter goes up, the nominal exchange rate has to be adjusted to maintain the value of the real exchange rate).

The other guide is the fiscal and the trade deficit, which together affect the current account in the balance of payments. A large current account deficit means that we

are spending more than we are earning. The fiscal deficit is unsustainable at over 4 per cent (post-budgetary shenanigans render the government's fiscal target for this year less credible) and the trade deficit has shot up to $3.5 billion. If these deficits were temporary, due to crop failure or other calamities, and if we had the reserves, we could have run those down to tide over the emergency. Alternatively, we could borrow short term in the international commercial capital market to cushion the economic shock. But if the problem is endemic and if reserves are already low, the international capital market demands a heavy premium, which increases the debt burden. In any case, such quick fixes are unlikely to get to the root cause of the problem, which is that as a nation we spend more than we earn.

What the Governor needs is a policy measure that reduces our expenditures and increases our earnings. Given the current macroeconomic picture, a sizeable devaluation of the currency is precisely such a policy measure. It sends a strong signal to domestic spenders that imports are expensive, so avoid them. Simultaneously, a message is sent to foreign consumers that Pakistani goods are cheaper, come and get them. This brings down the trade deficit and checks the pressure on reserves. Having arrived at this conclusion without any arm twisting, we may now approach the concessionary international lenders, i.e. the IMF and the World Bank, borrow at low rates and be rewarded for our wisdom!

It is often argued that neither Pakistani imports nor exports respond to price changes and therefore devaluation is an ineffective instrument. This is nonsense. In the aggregate, responsiveness to price signals is rational human behaviour. When imports become expensive, we postpone purchases and that reduces aggregate demand. Similarly, why should foreigners not buy more Pakistani goods when they become cheaper?

But let us ask ourselves what would happen if we did not devalue. An increasing number of people would take a position against the Pak rupee, confident that the value of the rupee cannot be sustained. This would put greater pressure on the rupee and the needed devaluation to correct the imbalance later would have to be much larger.

Another woolly argument is that we do not have 'exportable surpluses' and therefore exports do not increase when we devalue. This notion of exportable surpluses is a perplexing one. Does Lahore export knitwear because T-shirts are left over after the Lahoris have bought what they need? Does Sialkot export soccer balls because it has some to spare after meeting the needs of Sialkoti soccer players? Countries don't export because they have surpluses, but because they have a comparative advantage based on their abundant factor, which in our case is labour, raw cotton, and leather. If we price these factors correctly via the exchange rate, we will export, surplus or no surplus.

Finally, we must begin to address the fundamental problems faced by the economy to avoid devaluations, which may sometimes be necessary but are always disruptive. We must tame the impulses that result in fiscal deficits and address the perverse incentive structure that retards export-led growth. Otherwise, we shall find ourselves running frequently to the tailor to loosen our belts when the real culprit is obesity. Only by fighting obesity at both the aggregate and the individual level, will we achieve a stable and realistic exchange rate, which is the corner stone of sound macroeconomic management.

Source: Nabi, Ijaz, *The Friday Times*, Lahore, 19–25 September 1996.

Is there a case for devaluation?

The answer to this question is pretty straightforward. There is no evidence at all that the Pakistani rupee is over-valued and, therefore, there is little reason to believe that a devaluation is on the cards. Neither movements in the balance of payments and the capital account nor in the real exchange rate vis-à-vis our major trading partners and competitors suggest that the rupee is misaligned. Indeed, a devaluation, when none is called for, may actually retard our principal policy objective of reining in inflation.

First, the balance of payments. A sudden surge of imports or a sharp fall in exports or in factor payments registers as a balance of payments deficit. If it is not funded by movements on the capital account, reserves begin to be depleted. This shows that we want the rest of the world's goods and therefore its currencies more than the world wants ours. This is a clear signal that we must adjust downwards the value of our currency.

However, the evidence on recent movements in balance of payments does not show any sudden deterioration. The balance of trade is a negative $2.3 billion, which is in keeping with the medium-term trend. The services account is also in the negative at around $2.5 billion, again fairly close to the trend. Remittances, on the other hand, have registered an increase of around $500 million over the previous year. All of this adds up to a current account deficit of $2 billion, which is a little worse than last year's but is a substantial improvement over the year before that, when we went on a spending binge (the yellow cabs scheme).

A current account deficit is consistent with the fact that being a developing country, we are a net importer of capital. The capital account shows that direct foreign investment and concessionary official flows have financed most of the current account deficit—in fact, our reserves actually improved by $242 million in 1994–95 as a result of such transfers. All of this adds up to the conclusion that there is absolutely no untoward development in the balance of payments or in capital movements that calls for a devaluation of the rupee.

The second argument for devaluation is that, as a result of high inflation relative to our trading partners, the real exchange rate (which is simply the nominal exchange rate adjusted for the change in relative prices) has appreciated. This has raised the price of our exports and lowered the price of imports. This loss of international competitiveness, it is argued, must be remedied by a devaluation of the rupee.

Installation triggered

This is a sophisticated argument and requires a careful look at the evidence on movements in the nominal exchange rate and relative prices vis-à-vis our trading partners. I have done this for our five major partners, the US, Japan, Germany, UK, and

Table 1
Nominal effective exchange rate

Pakistan	100	323	2.23		
		Relative price index 167.95			
					242

France who together account for nearly half of our foreign trade (imports plus exports).

Table 1 gives the movement in the nominal effective exchange rate, or NEER, (which is simply an index of the nominal exchange rates of the five major trading partners weighted by their shares in trade) between 1980–81 and September 1995. The calculations show that NEER depreciated from 100 to 405. In other words, the same unit of major trading partners' currency now costs nearly four times as much as in 1980–81. This is a substantial nominal devaluation of the rupee. The question is: is it enough given that inflation in Pakistan is considerably higher than in the major trading partners?

To answer this, we have to look at how the relative prices have moved between Pakistan and the major trading partners. Table 2 traces the movement of prices in Pakistan and its five major trading partners. The last column of the table shows that the trade weighted consumer price index of our trading partners has increased from 100 to 168, while the index for Pakistan has increased from 100 to 323. It is this relative increase that exporters bemoan when they ask for a devaluation.

In other words, what the exporters want is a depreciation of the real effective exchange rate (REER), which is simply the relative price index (calculated in Table 2) divided by NEER (calculated in Table 1). Notice that NEER is 405 and the relative price index 241. Thus the depreciation in the nominal exchange rate has more than compensated for the higher price level in Pakistan relative to the major trading partners. In fact, there has been a substantial depreciation of the real effective exchange rate, so that Pakistani exports have become even more price competitive than in the past. Thus there is no justification at present for a devaluation of the nominal exchange rate to restore price competitiveness.

The recent adjustment of the Indian rupee is being cited as the third argument for devaluation. The evidence does not support this either. Between 1974 and 1975, India's CPI index increased from 100 to 488.5, while the nominal exchange rate index fell from 100 to 24.23. Meanwhile, Pakistan's CPI increased from 100 to 379 and the nominal exchange rate fell from 100 to 31.36. Thus the ratio of the two indices in the countries has moved fairly close together over the years and Pakistan has not suffered any loss of price competitiveness vis-à-vis India. India's exchange rate is now market determined and short run fluctuations in it do not call for an immediate response from us.

It is interesting that the market has read the evidence correctly and is not signalling a lack of confidence in the nominal value of the exchange rate. There is virtually no premium, other than the small margin to cover transaction costs, either in the curb market or the FEBC rate of exchange.

It is worth bearing in mind that exchange rate policy can influence only the nominal exchange and not the real exchange rate. The latter, which is the proper measure of competitiveness, is determined by relative price movements. Indeed, it may well be that a short term devaluation, when it is not called for, may buy a lot of long term inflation, resulting in an appreciation of the real exchange rate, thus producing results contrary to those intended.

Furthermore, a devaluation always has some short run costs such as an increase in the international debt burden and a general reduction in the standard of living. If there is a crisis in the balance of payments or a substantial appreciation of the real exchange rate, it might be worthwhile to bear the short run pain. But when such misalignments are not indicated, it seems unnecessary to add to the difficulties of the ordinary citizen already suffering under the ongoing structural adjustment.

Having said all this, we must recognize that exporters indeed are hurting. But the real culprit is high domestic inflation, which has raised the costs of production, including the high interest rates. To control inflation, our principal policy target must continue to be a reduction in the fiscal deficit. This is the best way to restore competitiveness in the long run to put the economy on the path of exported growth.

Appendix 9.3

Winner or Loser? A Post-Quota Case Study of Pakistan's Textiles and Clothing Exports

Umair Hafeez Ghori analyses the impact on Pakistan's Textiles and Clothing (T&C) sector after the quota regime came to an end. Excerpts from his detailed analysis follow.

Issues for consideration

A major weakness of Pakistan's T&C industry is the lack of diversity (both in terms of products and target markets). Since the end of quotas, growth was recorded only in selected textiles segments, while clothing exports declined significantly. The emphasis on cotton textiles is a major factor behind the lack of product diversity into the man-made fibre (MMF) and composite MMF-cotton categories. This especially affected Pakistan's exports to the EU/US in the wake of the economic slowdown.

Prior to the economic slowdown in the EU/US market, there were predictions that the looming crisis may affect Pakistani T&C exports. The main reason behind the need to diversify from heavy reliance on cotton-based products is that polyester and MMF products are considered more affordable than 100 per cent cotton products (that cost more and are difficult to maintain). Since the global financial crisis affected the average spending on clothing, consumers preferred the cheaper composite fibre products. This is further reinforced by statistics examined where growth is visible only in textiles related made-ups sector rather than value-added clothing industries.

Anis-ul-Haq (Deputy Secretary of the All Pakistan Textiles Mills Association–APTMA) admits this weakness and comments that: '. . . we are caught in the web of 80–20! 80 per cent of our exports go to 20 per cent of countries. Similarly our fabric composition is mainly 80 per cent cotton and 20 per cent synthetic fibre. Our export reliance versus domestic use is also in 80:20 ratio whereby we place 80 per cent reliance on export and rather than value addition. We suffer from structural imbalance and hence are not trained in value addition production'

According to Anis-ul-Haq, Pakistan's industry is handicapped because very few entrepreneurs venture out and search for alternative markets. Pakistani entrepreneurs mostly rely and plan on the basis of business information gleaned either through business magazines and informal networking rather than through trade offices abroad.

In addition to the typical Third World problems and supply side constraints such as power shortages, poor infrastructure, bureaucratic inefficiencies and political instability, Pakistan faces gradual obsolescence of its industrial infrastructure. The average performance of Pakistani T&C was not unexpected, given that exporters and industries were well aware of the risks and potentials of quota expiration. Most entrepreneurs invested in upgrading infrastructure and capacity building of workers through training programmes in order to enhance their productivity for the post-quota period challenges.

The value added industries have incurred the bulk of losses in the post-quota period in Pakistan. Awais Mazhar, owner of Angora Textiles (a vertically integrated unit specializing in knit garments, woven garments, and denim products that handled orders from high-end clothing brands) was one of the foremost casualties of the quota expiration process. According to Mazhar, a major cause behind Pakistan's decline in the value-added sector is low labour productivity along with extraneous factors such as the security situation, rising costs, energy constraints, and negative image of Pakistan as an outsourcing venue. Mazhar claims that he followed and acted upon 'all those analysis that over informed me when quotas were about to run out and the virtues of vertical integration'. Mazhar not only upgraded his manufacturing capacities by importing state-of-the-art equipment but also embarked upon an ambitious employee training regime.

Mazhar also provides unique insights of how the flawed investment policies of the Government of Pakistan affected the value-added industries, for example, in a bid to attract the global chemicals giant ICI into investing in the polyester subsector of Pakistan, the government offered ICI a 15 per cent tariff wall against any competing imports. As a result of this protection from competition, the polyester manufacturers in Pakistan often demand a price of their choice from the textile industries that combines traditional cotton yarn with MMF. The increase in cost is transferred from the textiles industries to the value added industries that are forced to source their inputs from local manufacturers because of high tariffs on textiles imports. These comments by Mazhar provide a link to Anis-ul-Haq's comments of Pakistan being 'caught in the web of 80–20' (as mentioned earlier).

The implication of these comments is that unless Pakistan reduces tariffs on textiles imports and MMF sectors, the input costs will continue to rise and will directly affect any value added sectors that are import-dependent. Unlike the MMF dependent clothing sector, bed linen, towels, and cotton denim fabric are not import dependent. This is the primary reason why these sectors have seen growth in the post-quota period and the value added industry has not.

Exports from Pakistan's value added industries were also affected by the yarn crisis of 2009–2010. This crisis sprang from high global yarn prices. Since Pakistani yarn is widely viewed as relatively cheaper in US dollar terms as compared to Indian and Chinese yarn, most yarn manufacturers exported their output rather than selling domestically causing yarn shortage for the clothing industries. The clothing industry pressured the Government of Pakistan to introduce a temporary 15 per cent export duty based on quotas in a bid to limit exports. However, this restriction was removed in July 2010 after the apex body of the textiles industry (APTMA) reported that 50 yarn-producing units had either shutdown or scaled down their operations.

In addition to the issues highlighted above, Pakistan's value added industry is significantly impaired by their inability to offer full-package service for foreign retailers. Syed Shad Mustafa (director of an intermediary company that sources local inputs for foreign clients) dispels the impression that only supply side constraints are to blame for Pakistan's performance in the value added segment. Mustafa cites extended power shortages in some cities of India, frequent natural disasters and civil disturbances

in Bangladesh and states that the decisive factor in modern clothing trade is the ability to follow the 'direct-to-store' service (the 'DTS Model'). Mustafa further elaborates that instead of being entirely dependent on reports by experts and business magazines to inform them of shifting market dynamics, Pakistani manufacturers following the DTS Model maintain overseas offices and warehouses. This allows them to gauge changes in fashion trends, and offer superior client service including reduced turnaround times for fashion-sensitive categories. If Mustafa's comments on DTS Model are contrasted with Awais Mazhar's experience, it may well explain why a vertically integrated processing unit that supplied leading foreign retailers went bankrupt. However, realistically speaking, the small- to medium-sized operator does not possess enough resources to maintain overseas offices. Therefore, the disparity between large operators and their business advantage over small- to medium-sized operators are likely to continue in the future.

Another factor affecting the performance of the Pakistan's T&C industry as a whole is preferential access. In the backdrop of the War on Terror, it was expected that the US would 'reward' Pakistan by concluding an FTA and reduce barriers to market entry (tariffs were as high as 29 per cent in some categories). The US retail industry backed Pakistan but there was heavy opposition by the US textiles industry groups. This opposition has continued to date and as a result no FTA with the US has materialized so far.

Pakistan's industry also needs to shift its focus on to other developed economies. Any FTA with the developed countries such as the EU, Canada or Japan would give Pakistan's T&C industry a competitive edge over its regional rivals. The need for an FTA with developed countries is further reinforced if the impending EU-India free trade agreement (FTA) is taken into consideration. Currently, Pakistan has an FTA arrangement with China which allows Pakistan to export textiles products to China while not extending preferential treatment to Chinese T&C imports into Pakistan. However, Trade Development Authority of Pakistan (TDAP) data shows that the only significant Pakistani T&C exports are raw cotton and cotton yarn. It is obvious that Pakistan's exports have less potential to succeed in China currently; therefore, exporters primarily concentrate on targeting US/EU markets.

While the T&C industry would definitely like to see FTAs with developed countries, the policymakers have cautious opinions about regional FTAs, especially liberalizing the currently impotent South Asian Free Trade Area (SAFTA) which excludes several T&C tariff lines from liberalization schedule. In this context, Omer Hameed of the TDAP states that the government is generally in favour of trade liberalization but certain sectors in the T&C industries voice strong opposition to it. Hameed forcefully argues in favour of trade liberalization and comments that 'our industries need to decide whether they want to stay in infancy of development or diversify and be competitive'. The opposition to sectoral liberalization usually comes from small- to medium-sized operators that are more numerous and exert significant pressure on the government. As a result, the Government of Pakistan is reluctant in opening up sensitive sectors such as T&C and agriculture. Policymakers are perhaps also mindful that they lack the resources to retrain, adjust, and compensate laid-off workers in wake of regional liberalization of the T&C sector. This fear preys most on the minds of the politicians that dictate trade policy rather than economists.

Since the larger T&C groups are aware of their competitive advantage, they see regional liberalization as opening up of an additional market. The small- to medium-sized enterprises, particularly the cottage industry-sized clothing units apprehend diversion of their orders to India if Pakistan's fabric manufacturers get a better rate as a result of tariff liberalization. These clothing units also fear that the influx of competing imports would affect their business in the local markets as well. Therefore, these sectors oppose regional trade liberalization in the Stolper-Samuelson sense.

The fears of the sectors are not unfounded. In a poor country with high inflation and unemployment rate, repercussion of mass lay-offs and decline in the leading industry is something that no policymaker can ignore. However, the myths and fears that have built in the minds of the small- to medium-sized operator against regional liberalization must be dispelled; for example, regional liberalization in the textiles sector would have meant that tariffs on fabrics and yarns would be considerably reduced, thereby enabling the clothing industries to use imported inputs. The recent yarn crisis in Pakistan could certainly have been avoided if the tariffs on yarn imports were lower!

The public choice theory also explains why Pakistan has not moved in the direction of regional liberalization, even where the government appears to acknowledge the positive effects this would carry for the Pakistani economy. The reality is that similar to developed countries, trade policy is dictated by the politicians that keep political, and not economic, considerations in mind. As a result, any measures that promote free competition with foreign imports are often looked at with hostility. Therefore, the Government of Pakistan must shoulder some blame for the mediocre performance of Pakistani T&C industries in the post-quota period.

Nevertheless, the recent positive steps taken by Government of Pakistan building on the Textile Vision 2005 scheme must be appreciated. The new Textile Policy for 2009-2014 scheme aims to enhance T&C exports to 25 billion USD by 2015. The policy extends PKR 42 billion in incentives during the fiscal year 2009-2010. Export refinance is reduced at a rate of 5 per cent with a PKR 2.5 billion allocation. PKR 5 billion is allocated as a relief on the existing long-term loans of the textile industry. Duty drawbacks are offered between 1 to 3 per cent for a period of two years for value added textile exports which will aid the industry to offset both its direct and indirect costs. Most importantly, this policy exempts the industry from regulated power supply (referred to as 'load shedding' in Pakistan) and allows it to have a prioritized gas supply. The new policy also establishes a Technology Upgradation Fund (TUF) that will contribute as a grant around 20 per cent of the capital cost on upgrade of T&C infrastructure.

Pakistan's T&C value added industries have yet to be weaned off their dependency on preferential access to the developed markets even after lapse of quotas, for example, Pakistan lobbied aggressively to secure preferential access to the EU market after 2005, having been unable to secure concessions under the EU GSP+ regime. More recently, these efforts culminated in the offer by EU to extend preferential treatment to Pakistan's T&C exports in October 2010 and also to assist the Pakistani recovery in the

aftermath of the severe flooding in the country. The October 2010 package of concessions featured three years of duty-free access for 75 per cent of tariff lines accounting for 27 per cent of Pakistan's exports to the EU (mainly in the textiles sector).

These concessions were later 'watered down' in November because of pressure from India and other EU members engaged in textiles production (namely, Italy, Portugal, Spain, and France). The revised package still kept the duty-free access for 75 tariff lines, but reduced the duty-free access period from three to two years, with a third year conditional on an assessment. Furthermore, the EU has incorporated quotas on sensitive categories (for example, fabrics, towels, women's jeans, and socks) which incorporate a suspension of duty-free access if imports grow by more than 20 per cent. For other products, a safeguard mechanism will serve as a safety net to protect against any major import surges. The EU package still has to secure official approval from the EU parliament and is further subject to waiver granted by the WTO. There is a strong likelihood that the waiver may face opposition from both the EU-based textiles manufacturing countries and other T&C exporters that compete against Pakistan in the EU T&C market. However, recently India dropped its opposition to the proposed EU package. In exchange, Pakistan has agreed to grant India most-favoured nation (MFN) status that it previously had not extended to Indian imports.

Pakistan's T&C industries are understandably desperate to enhance their competitive standing in the EU market. However, even when this concession package comes into force, it brings moderate benefits to the Pakistan's T&C industry (especially the value added segment comprising clothing products). Statistics examined in this research note have demonstrated that Pakistan's apparel exports have not experienced positive growth after 2005. Furthermore, availing this package would effectively mean that Pakistan's exports will be subjected to quotas and safeguards again which could artificially restrain the more profitable exporters of T&C in the country along similar lines in the Multi Fibre Arrangement/Agreement on Textiles and Clothing (MFA/ATC) period.

It is also interesting to note that Pakistan's bed linen exports to the EU, which already enjoys a significant share of the EU market, are being extended tariff concessions. The predictable positive effect of these EU concessions is that it will encourage more exports of bed linen to the EU. However, due to the proposed quota restrictions and the in-built quota growth rate coupled with safeguards to contain any spillover, the risk is that Pakistan may attract trade restrictions on its bed linen again (similar to the anti-dumping measures imposed by the EU on Pakistan's bed linen exports in 2004).

The EU concession package can also be criticized on the grounds that it does not encourage exports of labour-intensive clothing products. Instead, the package seems to buttress the already strong capital-intensive segments such as bed linen or other textiles made-ups. By designating some categories as sensitive, the flow of preferential treatment has been tightened considerably. With the EU concession package in the backdrop, it remains to be seen how Pakistan fares in the coming years. The current statistics show that Pakistan's T&C industry is now coming to terms with its strengths and weaknesses that were previously masked by the quota system. The liberalized trading environment has meant that competitive strengths of various T&C manufacturers will now determine trade performance more than preferential treatment or higher quotas in the developed markets.

Conclusions

Pakistan has the potential to excel in the post-ATC T&C trading environment but has so far managed lacklustre performance. Quotas skewed the manufacturing strengths of Pakistan and induced artificial diversification into manufacturing activities where there was little or no comparative advantage. The liberalized trading environment suits Pakistan in certain value added categories (which quotas had suppressed earlier). This is demonstrated by the superior performance in bed linen, cotton yarn, towels, and cotton denim fabric categories. Conversely, manufacturers that concentrated on categories purely due to availability of quotas have experienced declines However, with the possible signs of 'flying geese' type transmission of certain clothing industries from China, Pakistan may well be one of the recipients of the categories jettisoned by the Chinese clothing industries. This view receives further support from the fact that Pakistan possesses a large cotton base and some level of vertical integration in its T&C structure along with low labour costs.

From the 'flying geese' perspective, lack of liberalization will also mean that regional investment will be channelled towards more liberalized countries instead (such as ASEAN countries). Larger T&C segments in Pakistan are more willing to support market liberalization as compared to the small- and medium-sized entrepreneurs. The sensitive nature of the T&C industry has meant that the policymakers are reluctant to take any steps that may affect the smaller manufacturers. Pakistan also lacks the resources to compensate and re-adjust the industry segments that are inevitably affected by trade liberalization process. Hence the reluctance and lack of resources undermine the growth and diversification of Pakistan's T&C industries.

If a 'flying geese' type regional transmission does occur, Pakistan's falling clothing exports may receive a significant boost. In order to attract this investment, Pakistan's entrepreneurs have to overcome two major shortcomings. First, adopt measures to ensure availability of yarn for local clothing manufactures, and second, to increase productive capacities by adopting the DTS model of manufacturing. If the clothing industry signals its willingness to weather an increasingly competitive environment that follows liberalization, it may benefit from cheaper inputs which will allow this sector to become competitive again, especially when China is exhibiting signs of graduation to higher value added sectors. The challenge for Pakistan's value added industry is how it adapts to increase in competition that inevitably follows sectoral liberalization. To this, there is no easy answer. Currently, the Pakistani economy is characterized by high inflation rate, low employment, negative effects of the security situation and the floods. In these circumstances, the Government of Pakistan would be reluctant to risk any economic liberalization in the T&C sector, fearing adverse effects on its most vital industry.

Appendix 9.4

Globalization: Another Name for Imperialism?

Nigel Harris discusses the political economy of the nature of globalization and imperialism in our Age.

The charge of 'imperialism' has served the Left for a very long time as a supreme accusation against the political order of the world. The term implies not that strong states invariably try to bully weaker ones, nor that 'imperialism' is just a fancy name for Washington, but that there is a world political order embodying systemic relations of domination. However, while once there might have been relatively robust theoretical underpinnings to this approach (in Lenin's popularisation of the combination of Hobson and Hilferding), the thesis has long since been shown to be doubtful.

On the other hand, imperialism's opposite, 'national self-determination', seems equally of doubtful validity in conditions of economic globalization. Indeed, these theoretical difficulties become even sharper when it is recognized that Washington, the supposed global hegemon, is itself trapped in an apparently insoluble crisis in the global economic order—the political agenda comes apart from the economic. What follows are some notes for discussion on an alternative approach to characterising the world order.

(1) Since about 1980, the world economy and its constituent national parts, has been dominated by the transition to a single global economy, 'economic globalization'. This imposes on the world a changing pattern of territorial specialisation and interdependence, organized by global markets, not—as hitherto rightly or wrongly believed—by national states. The economic integration of the separate political territories (former 'national economies') into a single economic system has been achieved by states (at different times and stages) relinquishing control of external trade, of capital movement and finally, albeit partially, of labour. Indeed, by now it is doubtful in the core of the system whether 'national economies'—discrete territorial areas of autonomous economic activity, defined by political boundaries—any longer exist as objects of effective government policy. States here at best seek to manage global economic flows that begin and end beyond both their authority and even knowledge. The free flow of the global factors of production is creating a single integrated economy outside the control of any one national political authority (as in the original creation of national economies free movement within carved out a national economic entity from what had been often a regional economy—witness, for example, the formation of Germany or the partition of India). The destruction of the old Soviet Union and the former eastern bloc, of apartheid in South Africa, as well as the coming transformations of others (North Korea, Myanmar, Cuba, etc.) can be seen as only the more extreme examples of this apparently inexorable process of economic globalization.

(2) The first phase of the current transition has been characterised both by extraordinary levels of prosperity in the heartlands of the system (the Atlantic economy and Japan) and an unprecedented geographical spread of economic growth (to China, east and south-east Asia, eastern Europe to Latin America, and latterly to India). This in turn may now draw into the process sub-Saharan Africa. In the first phase, opinion rejoiced that apparently the world had mastered the secret of sustained and spreading economic growth; in the second, marred at the end by severe economic crisis in the heartlands, there were growing fears that globalization had robbed the world of political governance, the state, and imposed a global territorial division of labour which made it impossible to employ the mass of the labour force, implying long-term mass unemployment. There seemed to be simultaneously an existential political crisis of the state and an economic crisis of material survival.

(3) Historically, the current transition is the second great surge towards economic globalization. The first, between say—1870 and 1914—ended with two world wars and the Great Slump in which states not only clawed back powers they had conceded to global markets, but immensely enhanced and centralized political control over their respective national economies to an unprecedented degree, epitomised in the extraordinary concentration of state power in Nazi Germany and Soviet Russia. More generally, the period established an uncritical faith in the potential of state planning and dominant public sectors, nowhere more so than in Nehru's India. Everywhere governments mimicked the imperatives of the war economy, even in peacetime. It took nearly another half century after the end of the Second World War to resume the drive to economic globalizaton, now with much enhanced vigour and comprehensiveness, and encompassing the whole world, not just the Atlantic economy.

(4) Indeed, never before in the history of capitalism, it seems, has the ethic of competitive markets and 'neo-liberalism', penetrated so deeply into the domestic operations of the state, into virtually every cell of the social order. Neo-liberalism has established an extraordinary intellectual hegemony, founded not upon an excess of greed (that was always there), nor an intellectual error among economists, but rather as the ideological expression of an order of global capital—the neo-liberals are the product of the process, not its source. We are now within sight of the reversal of many of the major historical efforts to limit the power of markets—from the New Deal and Great Society legislation in the US (even including the right to collective bargaining) to the welfare state and social services in Europe. In the period from the 1950s to the present, there has been an almost complete reversal of the dominant statist narrative. In that time, in the developing countries, accelerated economic growth was seen as exclusively attainable through economic isolation, closure to the world; now it is seen as exclusively attainable through 'opening up'.

(5) 'Opening up' the national economy (and undertaking all the domestic reforms for this to work) involves allowing the integration of national and global economies, allowing domestic economic activity to be decided by global markets

rather than by the state—or electoral—priorities. By implication, the state relinquishes any ambition to shape the domestic economy in any particular direction, restricting itself to managing efficiently and facilitating the accommodation of global forces.

(6) However, the emergence of a national 'global state' (that is, a state, the function of which is to manage the local economy and society in conformity with global, not local, imperatives) profoundly weakens the political position of the State, compared to the past. The state is obliged to relinquish much of what used to be a national political agenda which involves the management of external trade, capital movements and, in principle, labour flows. It relinquishes power to bribe the electorate and to secure its political perpetuation, to reward patrons, etc. To put it, simplistically, it faces contradictory options—to secure economic growth (through integration in the world economy) but with weakened state control over its political environment; or to enhance its political dominance at home with economic stagnation. Of course, depending on specific circumstances of a particular state (and the cumulative effect of past policies), opening up to the world may not lead to economic growth, in which case, the state has no recourse except to rule by violence. In an existential crisis (such as, for example, faces the Assad regime in Syria), the state will be obliged to sacrifice present and future economic growth—and indeed, the inhabitants—to hold on to power.

(7) The threat to state power is political in a different way—through undermining the domestic social solidarity that is supposedly a precondition for stable government. No population is likely to remain indefinitely loyal to a state seen as working exclusively for foreigners (the 'world system'). Nowhere is this more apparent in developed countries than in the field of immigration. The mobility of labour internationally seems now to be a precondition for economic growth. No advanced economy is now self-sufficient in labour (including here the changing diversity of skills required to cope with changes in the economy imposed by changing global demand). However, the solidarity underpinning the old state required levels of xenophobia, and sometimes racism which are incompatible with continued immigration, required to sustain the 'churning' of the labour force to sustain economic growth (especially where there are high levels of native unemployment). Everywhere today, certainly in the heartlands, there are increasing restrictions on immigration and mobility, despite the damage this does to economic growth (not to speak of the welfare of an ageing native-born population). States are again caught in a contradiction—the conditions of growth undermine the elements of national closure (zero net migration) supposedly required to make state power secure (seen most vividly in North Korea and the old Stalinist states).

(8) It is perhaps this contradictory position which today inhibits states from copying the reactions to the interwar Great Depression which ended the first surge of globalization—economic closure and domestic authoritarianism. The reaction now is fragmentary and contradictory—moves to authoritarianism, along with continued neo-liberal reform, attempts to cut immigration, to demonise 'illegal immigrants' (and Muslims) but without systematic protectionism. Of course, the longer the crisis persists, the more it may become an existential issue for the state, especially if marked by popular revolt against economic austerity. Then greater the danger, states will seek to recover their lost powers, and reverse economic globalization, sacrificing the welfare of their own—and the world inhabitants—to their own political survival. The issue of a world slump was only settled last time around by resort to a world war and a terrible orgy of self-destruction. At the moment, world war seems unlikely but one should not underestimate the potential for auto-destruct when one or other state's existence appears threatened, producing the 'common ruin of the contending nations/classes'.

(9) These trends—if 'trends' they are—go with attempts to disenfranchise the citizenry, to isolate government from 'politics', to protect the global system (and states) from popular demands and pressures, and install technical or expert administration (the World Bank and International Monetary Fund (IMF) play a key role here in training a global cadre of experts to direct the financial administration of states). Independent central banks—and independent national statistical agencies—are required to reassure 'global investors' that mere governments—or 'politics'—cannot be allowed to interfere either with monetary policy or basic data. In the special case of Europe, experts have been parachuted to run Greece and Italy, and binding clauses inserted in respective constitutions to enshrine conditions of national management. Some of the language betrays the displacement of the sovereign people—'citizens' become 'clients' or customers for state services, where the criterion of judgment becomes efficiency and cost of provision not the exercise of popular sovereignty. Undermining popular representation further erodes the legitimacy of the state.

(10) In crisis, the limits imposed on national sovereignty by the new order are slowly becoming clearer. On the economic front, the global economic nexus and global market, severely discipline national policy, and those constraints are reinforced by the political order of states, the so called 'international community'. The state begins to behave as an agent for an economic and political world order, enforcing global imperatives on the domestic population, rather than representing it to the world at large (let alone defending it against external threats). If state sovereignty is no longer practicable, will the world's fascination with 'national liberation' be undermined? Not while aspirant ruling classes are willing to fight for a place at the top table and there are no alternative options for popular self-emancipation. Winning national independence and a new state allows privileged access to loot the new country—and then deposit the proceeds in Vermont or Kent or Provence (as with the Gaddafis or the Bhuttos).

(11) The conjuncture exposes the separation of what we might call two ruling classes: a territorial national ruling class, whose very existence depends on holding a national territory (composed of the state administration, armed forces and security services, crony capital, owners of land and infrastructure, etc), and a global ruling class which directs the companies and corporations which constitute the global economy, the mobile global rich, the staff of international agencies and non-governmental organizations (NGOs), etc. That is, a global social stratum for whom nationality is a

mere contingency, not a matter of defining identity and loyalty. In practice, the two classes are not at all clearly distinguishable, and members pass freely between the two. What is distinguishable is a political interest (for example, between neo-liberalism and economic nationalism), and a role (national versus international).

(12) Thus, we may be entering a period which combines both the extraordinary potential for an end of world poverty, and an existential crisis of the fractured political order of the world. The danger is that the territorial ruling classes may use their overwhelming control of the powers of physical coercion to restore national dominance of the global economy, resulting in domestic authoritarianism with economic stagnation (with possible perpetual warfare on the borderlands to enforce social discipline, a combination so brilliantly imagined in George Orwell's 1984). In practice—and hopefully—global economic integration is by now so advanced, it cannot be comprehensively reversed, even if components can be qualified (for example, free movement of labour), and states will continue to try to cheat on the rules. States have an interest in the developed countries, in inflating the popular fear that the new international division of labour will render redundant larger sections of the labour force, to support populist authoritarianism that could damage economic globalization—and hence global welfare. Elements of possible national capitalisms already might be seen to exist in the marriage between national militaries and crony capitalism in some important states (Russia, China, Pakistan, Iran, etc).

(13) As we have noted, many states have already been making adjustments to the new circumstances. One of the more curious—if not risible—by-products of this has been the ubiquitous spread of debates on what it is to be a native, the 'values' supposed to unite the natives, often under the pretext of the need to 'integrate' non-natives (immigrants, refugees, etc.). The discussion is obscure since what united, say, the British, was never shared values but common subordination to the British state. But it is embarrassing to admit that there is nothing else in common. As so often, out of its peculiar circumstances (including immense cultural diversity), Israel appears as a pioneer making these adjustments—combining militarized ethno-nationalism, religious orthodoxy, and authoritarianism, employing the Arab Israelis and Palestinians as an anvil on which to forge unity out of immigrant diversity, with perpetual war in the occupied territories as a source of popular fear. However, the combination in the medium term could be suicidal for an economy as globalized as that of Israel.

(14) Left to itself, the global system appears incapable of resisting self-destruction. Markets and the competitive drive to profit seem incapable of establishing the self-discipline to escape crash. The global capitalist class shows little potential for political self-government. For that, they are dependent on the existing political order. Yet the fragmented political order appears incapable of overcoming its ferocious rivalries to achieve unified action. The core problem, in sum, is an integrated world economy, driven by global markets (the outcome of which can neither be determined nor predicted) and which faces a fractured political order of competing states, each undermined by global capital. Capital for a very long period was able to hide behind one or other state but now in the final phases of the completion of a global bourgeois revolution, it is obliged to step into the limelight, unprotected by political power. Meanwhile, the opposition to global capital—from the scattered occupations, the Arab Spring, the trade union fight against austerity in Europe, to the hundreds of peasant agitations and strikes in China—remains trapped within each national context, each assuming a state which can change their environment for the better. The creativity of these movements is not in doubt, yet we cannot even begin to visualize a realistic road map to one world, a world without war, with a unified drive to end world poverty, secure a livelihood for all with security, in a safe and sustainable environment. Revolutions in one country can no longer achieve 'national liberation' (that requires breaking the global order), and though revolutions may spread (as we have seen in the Arab spring), the outcome only reiterates the same order of competing states, itself at the core of the underlying problem.

(15) These notes began with an implied criticism of the Left insofar as it identified the contemporary world as 'imperialist'. The charge put Washington at the centre of a world system of domination, implying that achieving self-determination by overthrowing Washington would achieve the liberation of the world. However, Washington itself is victim to a global capitalist order. Not only is it mired in an apparently insoluble economic crisis, it has lost its economy (and its capital, now global), now a junction in global flows. Its spectacular armaments in no way resolve the economic problem. Washington's extension into the world is not 'imperialism' but an attempt to create a substitute for the missing world government, not in the interests of the people of the world so much as the tiny minority that directs the US.

Part 3

Fiscal Policy

The two chapters that constitute Part 3 of this book are devoted to issues of taxation and expenditure, debt and deficit (i.e. fiscal policy). We examine the tax structure as it existed in Pakistan up to around 2011, following which much changed, and examine the fiscal relationship between different tiers of government prior to that time. The tax-to-GDP ratio and the nature and structure of taxation in Pakistan are analysed in detail, since they form a fundamental part of the fiscal policy. Pakistan's perennial fiscal deficit, and hence the ever-increasing debt burden, is considered to be one of the most serious problems of the economy, affecting a number of other variables as well. We question the claim that the fiscal deficit causes most of the problems in the economy that are attributed to it. We find that while government expenditure in excess of revenue is a problem, the more conventional attributes of a fiscal deficit are found wanting in the case of Pakistan. Our analysis suggests that the issues of politics, governance, and quality of public expenditure should perhaps form the focus of informed debate about the fiscal deficit. After the 18th Amendment and 7th National Finance Commission Award in 2010, there have been fundamental changes in the manner that different tiers of government will function and deliver social services, and the way they will relate to each other. These issues are discussed further in the new, added, Part IV of this book.

10 Resource Mobilization and the Structure of Taxation

On 30 December 2009, in the presence of the Chief Ministers of the four provinces and the Prime Minister of Pakistan, the signing of the 7th National Finance Commission (NFC) Award by the members of the NFC, took place at Gwadar in Balochistan. Agreement on this Award was reached after six meetings of the NFC, and the Award came into force on 1 July 2010 for a period of five years as mandated by the Constitution of Pakistan. As a Report of the Institute of Public Policy states,

> it has been rightly acclaimed as a great achievement. It enhances significantly the share of the provinces in the federal divisible pool from 46.25 to 56 per cent in the first year and 57.5 per cent in the remaining years of the award. Punjab showed great accommodation by accepting multiple indicators for horizontal distribution, primarily for the benefit of the smaller provinces. It gave up its position that population should be the only criterion for allocating central government generated revenue.[1]

According to the Institute of Public Policy *Annual Report* for 2011, this was the first of two major 'hallmark developments'.

The second major event which reinforced the process of strengthening provincial autonomy, and has largely redefined the nature of fiscal policy—tax and expenditure—is the 18th Amendment to the Constitution of Pakistan, which became law on 9 April 2010. According to the Institute of Public Policy Report,

> with this Amendment the Concurrent List of the Constitution stands abolished, devolving the functions contained in this list largely to the provincial governments. This significantly enhances the range of functional responsibilities of provincial governments and constitutes an important step in bringing the government closer to the people.[2]

Not only does the 18th Amendment bring about changes in the structure of the government, it also radically redefines federal and provincial fiscal issues, and the relationship between the federation and provinces. The Institute of Public Policy maintains, that on account of these two developments, 'the years 2009–10 and 2010–11 will be memorable years in the history of Pakistan'.[3] Such is the nature and impact of these interventions—also see Chapter 13 for further details.

The consequences of such extensive transformations are discussed in different places in the Third Edition of this book, for they have an impact on taxation, expenditure, provincial autonomy, regional inequality, social sector delivery, and some other factors. Fiscal federalism and the implications and consequences are specifically discussed in Chapter 13, in Part IV. Chapter 10 examines issues pertaining to public policy and fiscal finances, and deals with issues prior to the 2010 changes which are still in a process of being established.

One of the major functions of government is to tax its people. This revenue is then supposed to be used for a number of purposes, which include the running of government itself, the provision of law and order, the defence of the country, and for infrastructure and social development. Governments build roads, schools, hospitals, and dams, and provide a host of other services. For all these purposes, governments raise revenue from those who make profit, from one source or another, within the country. Even though the role and extent of government involvement in the economy and in the lives of the people has been debated, with growing concerns that there may be 'too much government', and taxes, like death, are one of the two certainties that affect our lives.

Taxation structures and the extent of taxation vary from country to country, and often, governments within a country may suggest taxation reform based on their particular political dispensation. In Pakistan, a well-defined constitutional framework determines the nature of resource mobilization and the responsibilities of each of the different tiers of government, and has undergone change from time to time, but perhaps not as radically as after the 7th NFC Award and the 18th Amendment in 2010. This chapter discusses the structure, nature, and extent of taxation in Pakistan prior to these changes, focusing on the issues at each level of government. From the constitutionally ordained legislative functions of government to the relationship between different levels of government, and to the extent of revenue collected from different sources, this chapter examines the salient features of Pakistan's taxation structure. This chapter provides an historical account of how taxation and fiscal issues existed and were structured until 2011, and despite the changes which are still in a process of being implemented, there are numerous aspects of the old structure and system of public finance, which is still very pertinent to understanding how public policy works in Pakistan.

10.1 The Structure of Government and Taxation[4]

10.1.1 Legislative Functions

The Federation of Pakistan is governed by the Constitution of Pakistan of 1973 and all its amendments thereafter. The

Constitution specifies the functions of the federal government and of the provincial governments. The federal government has exclusive responsibility for undertaking functions under the Federal Legislative List, which is contained in the Fourth Schedule [Article 70(4)] of the 1973 Constitution.

The Federal Legislative List includes functions of a regulatory and service nature. Service functions include defence, external affairs, currency, stock exchanges, national highways, and strategic roads, railways, etc. (see Figure 10.1). In addition to these functions, which were the exclusive responsibility of the federal government, there was also a Concurrent Legislative List which contained functions which were performed by either the federal or provincial governments, or both. These service functions included population planning and social welfare, tourism, and education. Residual functions not specifically contained in either the Federal Legislative List or the Concurrent Legislative List were the responsibility, primarily, of the

Legislative and Actual Allocation of Functions among Different Levels of Government in Pakistan Prior to 2010

provincial governments—functions such as agricultural extension, irrigation, justice, and police. While the specific roles and functions of the federal and provincial governments were part of the 1973 Constitution, *the existence of local governments was not a formal part of the Constitution*. The status of the District Governments after 2001, was also not formally part of the Constitution, although they were part of the Legal Framework Ordinance (LFO) and found temporary reprieve under the 17th Amendment to the Constitution. Although amendment 140A to the Constitution based on the Legal Framework Order of 2002 required provinces to establish and empower local governments, it did not recognize local government formally as the third tier of the State. This meant that under this new, partially protected, District Government System, local governments had no constitutional protection, and provinces still retained disproportionate power. (Article 140A stated: 'Each Province shall, by law, establish a local government system and devolve political, administrative and financial responsibility and authority to the elected representatives of the local governments'—LFO 2002). The elected government after 2008, eventually disbanded the 2001 District Government system, and as has been the pattern of elected governments—see Chapter 12—no elected local governments existed anywhere in Pakistan for some years, a state which continued to prevail well in to 2013. Many of the residual functions that were not part of either of the Legislative Lists, and which were supposed to be performed by the provincial governments, used to be delegated to the local governments by the promulgation of ordinances. The 1979 Local Government Ordinance, which defined and allocated the responsibility of local government, was operative in the Punjab, Sindh, and the NWFP, while the 1980 Ordinance applied to Balochistan until 2001, when the Local Government Ordinances of 2001 replaced the earlier ordinances. These ordinances defined the functions and roles of the local government as delegated to them by the provincial governments.[5]

Of the functions allocated to local government by the provincial governments, there were a set of *compulsory* functions that urban councils, in particular, were expected to perform, in addition to an *optional* set of functions, which, as the name suggests, may or may not be performed by the local governments.

Figure 10.1 presents the services and functions that each of the three tiers of government were *expected* to perform, and those which they *actually* did perform. As the diagram shows, the federal government's role was, and continued to be of a more macro nature, while the provincial and local governments performed the key role in the provision of basic social and physical services and infrastructure. Moreover, an important observation from the way the responsibilities of the three governments were structured was that the type and number of functions that could be performed was 'very exhaustive and provides potentially for a high degree of decentralization of functions to local governments even in the rural areas'.[6]

While the potential of the role of different, especially lower, tiers of government may have been extensive, Figure 10.1 shows that most of the functions which were on the Concurrent List, and hence were the functional responsibility of both the provincial and federal governments, were actually being performed by the federal government. Similarly, a large number of responsibilities that were technically in the jurisdiction of local governments, were being performed by the provincial governments. This was more marked in smaller cities and the rural areas. Hence, it seems that some of the responsibilities of the lower tiers of government were being undertaken by a higher tier: the federal government in the case of the provincial governments, and the provincial government in the case of the local governments. Whether it was the higher tier that infringed on the jurisdiction of the lower tier, or the lower tier's inability—in terms of limited financial resources and/or inadequate institutional capacity—to cope with its designated responsibilities that was the cause of the encroachment, will be discussed in subsequent sections of this chapter. Partially as a consequence of these problems, a new District Government System was designed and put into place by 2001.

10.1.2 Inter-Governmental Fiscal Relations Prior to 2010[7]

Provincial and Local Governments

Before the implementation of the District Government System in 2001, local governments were extensions of provincial governments and the former acted on behalf of the latter. There was, therefore, a great deal of overlap between these tiers of government.

The provincial tax machinery used to collect some taxes which were then returned to the local councils. The Excise and Taxation Department and the Registrar of Stamp Duties, both of the provincial government, were responsible for collecting the local property tax and the tax on the transfer of property. The reasons given for this were as follows:

> The justifications generally offered for provincial collection (with revenue sharing) of municipal taxes are, first, that sophisticated procedures are involved in the assessment of liabilities of some taxes. These procedures are perhaps beyond the capabilities of local taxation departments, especially in the smaller jurisdictions. This is the justification given for assumption of the responsibility for property tax collection by the provincial governments. Second, that it is possible to realize significant economies of scale and/or avoid double taxation. This is the case particularly with a local tax which is levied on a similar tax base as a provincial tax. For example, the base for the tax on transfer of property is analogous to that for stamp duty and that for the local rate is identical to that for land revenue. As such, it is efficient for the provincial tax agency to collect both taxes at the same time and hand over the local component of revenue to the councils.[8]

In 1985/6, provincial governments, on behalf of local governments, had collected about 12 per cent of the total revenue receipts of urban local governments, and 5 per cent of the receipt of rural councils.[9]

There used to be a revenue-sharing arrangement between provincial and local governments which consisted mainly of the property tax and betterment tax, where a major portion of these taxes were transferred to the relevant local councils. In the case of the property tax, 85 per cent was returned to the local governments in the Punjab, Sindh, and Balochistan, while in the NWFP, as much as 95 per cent of total receipts of this head (net of collection costs) were made available to the local councils. It is important to point out that, while provincial governments received revenue from the federal government on the basis of population, the local governments received revenue on the basis of *collection*. Hence, there was no cross-subsidization and the larger the amount of revenue collected from a particular urban local council, the more it received, irrespective of its size. (There were no revenue-sharing arrangements between the provincial governments and local rural councils.)

Provincial governments used to have access to revenue-deficit grants from federal governments that bailed them out when they fell short of funds. Surprisingly, no such general grant-in-aid from provincial to local governments existed. The grants-in-aid from provincial government to local councils were specific in nature and used to finance recurring expenditure on education and health. Local governments had to take care of their recurring deficits themselves.

Moreover, local governments made further payments and transfers to provincial governments in the form of revenue from a surcharge on local taxes, especially in the NWFP and the Punjab. For example, an education cess of 12 per cent on octroi was charged in the NWFP, which was transferred totally to the provincial government. As an important and detailed report argued, 'this tendency of the provincial governments to ride on the back of the Local Government is a unique feature of the public finance structure of Pakistan'.[10]

Under the new system of 2001—now disbanded—as in the past, the districts continued to rely on federal transfers. In the earlier structure, octroi collected by urban councils constituted 50–60 per cent of autonomous local revenues, while zila export tax on agricultural goods out of rural councils (zila councils) collected about the same for these administrative units. These taxes were abolished in 1999–2000 before the District Government Plan was implemented and the arrangement was that the federal government would come up with a replacement grant paid out to the Tehsils. Under the new system, District Governments relied heavily on revenue transfers from the provinces and from funds marked for vertical programmes. In addition, similar to the National Finance Commission Award, which distributes funds from the federation to the provinces, a Provincial Finance Commission was also designed in each of the provinces, although they never came into being in any effective manner.

Federal and Provincial Governments

It is somewhat surprising that local governments had been expected to keep their revenues and resources in check and maintain a significant ability to self-finance their expenditures, while provincial governments were, for the most part, given a somewhat freer hand by the federal government. There existed an elaborate mechanism by which fiscal transfers from the federal to the provincial governments took place from taxes collected by the former. In fact, this mechanism was sanctified by the Constitution, where 'the Federal Government was required to transfer revenues from taxes, as may be specified from time to time, to the provincial governments. Taxes to be included in the divisible pool and the share to be given to each province is determined by various awards/commissions.'[11]—see Table 10.2.

The National Finance Commission (NFC) is a body constituted by the President of Pakistan which is meant to divide the revenue-sharing formula for the divisible pool of resources to be made available from the federal to the provincial governments. The NFC is supposed to announce an award every five years, on which basis the divisible pool is determined. However, as Table 10.3 shows, the NFC has not been constituted every five years and there was a gap of seventeen years between the 1991 award and the previous

award of 1974. Attempts were made in 1979 and 1985 to form the NFC, but all such initiatives failed. The next award was to be made in June 1996, but was delayed by a few months and was finally announced by one of Pakistan's numerous unelected, so called caretaker governments in late 1996. However, numerous objections to the award were raised by members of parliament elected to the provincial and federal governments following the 1997 general elections (see Appendix 10.1)—also see Chapter 13 for the most recent NFC Award of 2010.

Table 10.3 shows how the composition and size of the divisible pool from the federal to the provincial governments has changed over time. After an increase in the number and the amount of taxes between 1951 and 1970, there was a contraction in both in 1974, reducing the size of the divisible pool. The NFC award of 1991 distributed 80 per cent of the revenues from the federal to the provincial governments in the case of income tax, export duty on cotton, excise duty on tobacco, and sales tax. 'In addition, the Federal Government took over the responsibility of financing any residual deficits of the provincial governments in their recurring budgets. These ad hoc subventions and grants have grown very rapidly in subsequent years.'[12] Hence, the provincial governments got a far better deal through this revenue-sharing arrangement in 1991 than ever before. This is most noticeable from the fact that the total revenue accruing to the four provincial governments more than doubled from Rs. 7.1 billion in 1990/1 to Rs. 15.9 billion the next year after the award in 1991/2. While provincial governments' tax revenue in these two years increased by 40 per cent, non-tax revenues increased by 370 per cent![13] The 1991 NFC award gave a much needed boost to provincial government finances, which ended up in surplus for a change, but in subsequent years, they again ran into the perennial problem of huge deficits (see Appendix 10.1 in the first edition of this book). See Chapter 13 on the 7th NFC Award and for more recent developments.

In the case of revenue transfers from provincial to local governments, it was revenue raised from each council that determined the amount transferred to the urban local councils. In case of the NFC award and transfers from the federal to the provincial governments, it used to be essentially a single factor, population, which determined which province would get what share from the divisible pool. Hence, cross-subsidization would take place from a province that provided a greater share to the exchequer, to a province that did not contribute as much, simply because it was to receive a certain amount based on its population share (see also Appendix 10.1).

Despite an elaborate mechanism of resource transfers from the federal to the provincial governments, provincial governments were very frequently in deficit. Whenever this happened, the federal government had given ad hoc subventions and grants. Moreover, the Annual Development Programmes of the provinces had also been financed, at times totally, by resources transferred from the federal to the provincial governments. Another important difference between provincial and local governments was that provincial governments had recourse to interest-bearing loans from the federal government, which local governments did not.

Under the 1997 NFC Award a number of inter-governmental transfers were available to the provincial governments, three of which were 'unconditional'. The first was revenue sharing on the basis of population which included revenue from a divisible pool of taxes that was shared on a 62.5/37.5 basis between the federal and provincial governments, where population share determined which province would get what—see Table 10.3. The population-based transfers formed the largest amount available under this 'unconditional' category. Then there were shares in the form of straight transfers, based on origin, and included revenue from royalty and development surcharges on gas, royalty on crude oil, and profits from hydroelectric projects. Finally, special grants were made to Balochistan and the NWFP as these were considered to be less developed than either the Punjab or Sindh. Apart from these three unconditional sources of revenue given from the federation to the provinces, there were numerous 'conditional' grants, many of which were based on a matching basis—see Box 10.1 for an evaluation of the intergovernmental transfer system.[14] However, as Chapter 13 shows, 7th NFC Award of 2009 was a major departure from past practices, and brings about substantial changes from previous NFC Awards.

Box 10.1

Overall Evaluation of the Intergovernmental Transfer System Prior to 2010

The intergovernmental transfer arrangements in Pakistan, which include shared taxes based on population, straight transfers based on collection origin and various grants, have been criticized by experts for several reasons. The straight transfers component (12 per cent of total transfer revenues) returns selected resource revenues (oil, gas excises and royalties, and hydroelectric profits) to the point of collection. These arrangements are criticized for having no particular economic justification. On the other hand, they do benefit the smaller and less wealthy provinces, but this creates some major resentment. Larger, wealthy provinces are now seeking similar resource treatment for their agricultural commodities. Some argue that revenues from straight transfers would be better utilized for equalization if they were a part of a federal general revenue pool used for financing fiscal equalization if they were a part of a federal general revenue pool used for financing fiscal equalization transfers to the provinces. However, given the distribution of natural resources and the current political environment, it may be advisable to continue with the present system of straight transfers as they provide some resources to backward provinces.

The flow of funds through tax revenue-sharing arrangements (62 per cent of total transfer funds) is done on the basis of population. This programme is to be commended for its simplicity and objectivity in transferring a large pool of resources in a predictable fashion to bridge vertical fiscal imbalances. Moreover, Shah (1997) points out that these transfers are equalizing with respect to own tax collections and also mildly redistributive with respect to provincial GDP. The programme, however, does promote excessive dependence of provincial governments on federal transfers, which reduces own-source revenue collection incentives and encourages weak tax administration. As a consequence, the provincial tax bases are far from fully exploited, and further tax decentralization remains an unexplored option.

Traditionally very little attention has been given in Pakistan to fiscal capacity in addressing regional equity issues. The transfers system has lacked an explicit equalization standard against which achievements can be evaluated. Adoption of a formal fiscal capacity equalization programme and allocation among provinces by an appropriate predetermined formula would set a specific standard of equalization to be achieved. This would also help to determine the total amounts of transfers in advance, facilitating the planning of expenditures. The approach adopted by the NFC prior to the 1997 Award was purely one of gap filling where the deficits in the provincial budgets were being met. There were also no incentives in the system to reward greater revenue effort or efficiency in expenditure management.

The NFC of 1997 introduced a matching grant system. Under this system, an additional matching grant, which is equal to additional revenue mobilized from taxation reforms involving rate increases, removal of exemptions or introduction of new taxes, is given to the provinces. There are two contrasting views on the impact of this reform. One view is that for the first time, emphasis has been placed on incentives for better resource mobilization and an explicit premium is placed on the level of fiscal effort in the revenue sharing formula. The closed-ended nature of the programme is also seen as limiting potential abuses. If considerable improvements in revenues were seen, proponents argue that the matching grants system could be expanded to include all revenues in its net.

The contrasting view is that the programme of matching transfers for resource mobilization is not well conceived. It rewards provinces for higher tax effort due to changes in structure and rates of taxation but provides no incentives for revenue increases due to improvements in tax collection and administration. The programme also shows a lack of concern with additional burden of taxation at a time of deteriorating quality and quantity of provincial public services. The services provided by the provinces have been deteriorating over time, and additional taxation from the provinces without an accompanying increase in quality of provision may not be acceptable to the taxpayers. To be successful, rewarding general fiscal efforts as opposed to the present, more limited approach may prove to be more powerful in raising provincial revenues.

Federal-provincial specific purpose transfers in Pakistan are generally ad hoc and discretionary, and they primarily meet political rather than economic objectives. Certain transfers are intended to compensate the two fiscally disadvantaged provinces for their weak fiscal capacities but higher expenditure needs. In the absence of significant tax decentralization and a formal equalization programme, these represent a pragmatic approach to dealing with expenditure need differentials. As discussed later in our recommendations, however, a distribution formula based on indicators of backwardness would be more appropriate for distributing funds to these provinces.

The deliberations of a newly constituted National Finance Commission (NFC) have commenced and the respective positions of the federation and the federation units regarding future intergovernmental revenue-sharing arrangements have become clear. The research team interviewed various representatives of the Ministry of Finance, the provincial governments of the Punjab, Sindh, Balochistan, and NWFP, experts on public finance and media personnel. Various articles in the newspapers on the 1997 NFC Award were also consulted. First, it appears that there is a lack of federal willingness to further share tax revenues with the provinces. This stems from the current state of federal finances, with a high and rising budget deficit. The federal government has the primary responsibility for controlling the national budgetary deficit and retiring and servicing the activities in the country. Second, there exists in federal circles a perception of profligacy in expenditures and lack of own revenue generation at the provincial level, further dampening interest in providing additional resources. The federal government needs to resolve these problems by creating proper incentives for the provinces to behave as a responsible tier of government, rather than taking punitive actions, such as a substantial cut in revenue-sharing transfers.

The perspectives of the various provinces generally reflect their intent in increasing the share of resources that they receive. Sindh, for example, which accounts for 70 per cent of the revenue from all taxes, advocates a greater weight for origin of collection in the transfer of resources. Punjab is pushing for instituting royalties on their important commodities (wheat, rice, and cotton), arguing that these, like oil, are natural resources and should be treated as such. Balochistan, being the largest province, would like to see a distribution formula that places considerable emphasis on area. The NWFP is concerned that it is not receiving its electricity royalty as provided for in the Constitution. One point of agreement among the provinces was that the federal government has been paying little attention to the provincial concerns, and more needs to be done to meet their demands. There seemed to have been little room for negotiations in the past. The recent decision to constitute Provincial Finance Commissions is considered a step in the right direction. In the present environment and period of resource scarcity, however, there is concern that designing a system that is acceptable to all of the major players may be difficult.

10.2 The Structure of Taxation

The 1973 Constitution outlined the taxes and duties that the federal government was required to collect based on the Federal Legislative List prior to the 18th Amendment. These were as follows:

> Duties of customs, including export duties; duties of excise, including duties on salt, but not including duties on alcoholic liquors, opium, and other narcotics; duties in respect of succession to property; estate duty in respect of property; taxes on income other than agricultural income; taxes on corporations; taxes on the sales and purchases of goods imported, exported, produced, manufactured, or consumed; taxes on the capital value of the assets, not including taxes on capital gains on immovable property; taxes on mineral oil, natural gas, and minerals for use in generation of nuclear energy; taxes and duties on the production capacity of any plant, machinery, undertaking, establishment, or installation in lieu of any one or more of them; terminal taxes on goods or passengers carried by railway, sea, or air; taxes on their fares and freights; and fees in respect of any of the matters enumerated in the Fourth Schedule, but not including fees taken in any court.[15]

The provincial governments had the powers to make laws with respect to any matter other than those reserved for the federal government as described above. Just as the provincial governments had delegated some of their legislative functions to local government, they had also allowed local governments to collect some taxes that the provincial government did not itself collect. Hence, the provincial governments collected taxes that the federal government did not collect, and the local governments collected the residual taxes that the provincial governments did not collect. The distinction between direct and indirect taxes is also important, as discussed later. Table 10.1 gives a breakdown of the two types of taxes at the provincial and federal level prior to the 18th Amendment.

The revenue sources, based on rates and taxes that the provincial governments collected, included the following: tax on agricultural income; water rate; tax on trade professions, callings, and employment; capital gains tax on immovable property; excise duties on alcoholic liquor, opium, and other narcotics; tax on immovable property; land revenue; motor vehicle tax; stamp duties; electricity duties; entertainment duty; tolls on roads and bridges; betterment tax; taxes on cinemas and hotels; arms licence fee; court fee; cotton fee; and various other fees and taxes.

The provincial governments did not have the authority to assess and collect the entertainment duty or the urban immovable property tax in the Cantonment Areas in the provinces. Nevertheless, the collecting and assessing authority in these areas, the Cantonment Board, did collect and pass on a certain percentage of this tax to the provincial governments.

Almost all the major taxes worth any real revenue potential according to the 1973 Constitution, were with the federal government, and after the 18th Amendment, there has been a change in this mechanism. The Agricultural Income Tax (which is largely ineffective, though), Urban Immovable Property Tax, the Motor Vehicle Tax and Stamp Duties were the only exceptions. The revenue heads—see Table 10.2—assigned to the new order of local governments after 2001, were unable to generate sufficient revenue to meet local government expenditure needs. As a consequence, local government—District Government—continue to rely heavily on revenue transfers from provinces, and on direct, earmarked transfers from vertical programmes.[16]

However, it must be remembered that, since the existence of local governments was not constitutionally ordained or protected, their position was always somewhat tenuous. This was also reflected in the nature of fiscal powers that provincial governments had granted local governments. A report highlights that 'although separate fiscal powers have been specified for local councils, the provincial government has the overriding power to direct any local council within the province either to levy any tax or to increase or reduce any such tax by the specified extent or to suspend or abolish the levy of any such tax'.[17]

Understanding Pakistan's Taxation Structure

This section summarizes some of the key issues and components of Pakistan's revenue and taxations system and structure, primarily of the federal government, given its dominance in the taxation structure.[18] Also see Box 10.2 and Appendix 10.2 which look at similar issues.

The revenue receipts of the federal government constitute tax revenue receipts and non-tax revenue receipts. The revenue receipts of the federal government are derived from the following sources: i) proceeds from taxation; ii) net revenue of the Commercial Departments; iii) interest on loans advanced by the federal government; iv) return on investments made by the federal government; v) fees and other receipts realized by administrative ministries and divisions of the federal government; vi) surcharges on petroleum and natural gas, and vii) dividends.

Tax revenue collected by the Federal Board of Revenue (FBR) comprises of inland revenue and customs. Inland revenue comprise of income tax, sales tax, and federal excise duty. Tax revenue is of two types, direct and indirect, where direct taxes comprise income tax, workers' welfare tax, workers' participation fund and capital value tax. The indirect taxes are comprised customs, sales tax, federal excise, surcharge on gas, petroleum levy, taxes collected by the Islamabad Capital Territory (ICT) administration and airport tax. The major part of the revenue is administered by the Federal Board of Revenue. The non-tax revenue of the federal government is administered by various ministries/divisions and comprises the following sources: i) income from property and enterprise; ii) receipts from civil administration and other functions; and iii) miscellaneous receipts. In recent years, the largest component of non-tax revenue has usually

Box 10.2

Tax Evasion in Pakistan

One reason why Pakistan continues to have a low tax-to-GDP ratio, is the 'massive' tax evasion which takes place. Here are some accounts of the scale and estimates of this tax evasion.

1. Tax evasion hit 79 per cent, FBR admits
   Mubarak Zeb Khan, *Dawn*, Karachi 7 June 2011 reported:

The Federal Board of Revenue admitted on Monday that tax evasion hit 79 per cent this year and said it would have to be reduced to achieve the revenue target set for 2011–12. The tax gap (tax evasion) is the difference between potential and actual tax collection. The potential is the amount of tax the government will collect if everyone fully complies with the tax law. Briefing reporters on new taxation measures taken in the budget, FBR Chairman Salman Siddique, however, said there was no increase in the tax gap over the past few years.

According to a World Bank study, the tax gap, which was 69 per cent in 2008, has now gone up to 79 per cent. But Mr Siddique said as the figure of 69 per cent was calculated by using a different methodology, the two figures were not comparable. However, he conceded that 79 per cent was the highest-ever figure. At the same time, he said, the tax-to-GDP ratio also fell to 9.1 per cent from last year's 9.2 per cent. He projected the next year's figure at 9.5 per cent.

Mr Siddique said the FBR was focusing on reducing the tax gap. 'There is a potential to reduce the evasion percentage to 40 to 50 per cent.' The FBR chief said it was not possible to reduce the tax gap to zero. This was not even possible in developed countries like the USA (tax gap 22 per cent) and Britain (8 per cent). The tax gap in Pakistan could be brought down with constant efforts, he added.

A 2008 study showed that the gap in direct tax was 143 per cent, which was much higher than the 36 per cent gap in indirect taxes. This shows that a large number of people are not paying income tax.

Mr Siddique said there were nine such sectors (withholding agents), but they were not paying proper taxes collected from the taxpayers. 'We have full support of the top leadership, including the president and the prime minister, for broadening the tax base and bringing evaders and non-taxpayers under the net,' he said. In reply to a question, he admitted that there was a huge gap between the tax collection and its potential and said that efforts would be made to bridge the gap by improving the performance of FBR.

2. Shahnawaz Akhter, *The News*, Karachi, 19 February 2012

The International Monetary Fund (IMF) has projected a shortfall of Rs. 29 billion in revenue collection by the Federal Board of Revenue (FBR) against the target of Rs. 1,952 billion for fiscal year 2011–12 (FY12). According to baseline projections of the IMF, the FBR collection would stay around Rs. 1,923 billion. After any further improvement in tax collection, the tally may settle at Rs. 1,934 billion for the current fiscal year, the IMF said in a report released recently. In the last fiscal year, the FBR missed the target of Rs. 1,588 billion and collected Rs. 1,558 billion, showing a deficit of Rs. 30 billion.

The IMF projection of tax-to-GDP (gross domestic product) ratio is also behind the government target of 9.3 per cent. The tax-to-GDP ratio is estimated at 9.2 per cent for the current fiscal year, which was 8.9 per cent in the last fiscal year. The international agency attributed low tax revenue to weak fiscal structure, which resulted in a poor tax-to-GDP ratio, which is one of the lowest in the world. 'There is a general unwillingness to pay taxes, due to poor public service delivery and because of perceived unfairness in the tax system,' the IMF said. It said that agriculture is mostly outside the tax net; besides the number of taxpayer filing income tax returns is very small—about one per cent of the population.

Against dismal revenue collection, the IMF report said that there are large demands for government spending. 'Most notably, subsidies (mostly electricity subsidies) and interest payments consume almost half of government revenue while security spending uses up another quarter,' it added. As a result, there are large budget deficits that are difficult to finance, especially when foreign assistance is limited. Therefore, budgetary management relies too much on the containment of investment spending and borrowing from the banking system, the report said.

For a sustainable reduction in deficit, the IMF stressed upon a consistent growth in tax revenue collection. Besides, IMF suggested another attempt should be made at implementing the reformed general sales tax (GST), which can generate revenue up to three per cent of GDP in additional revenue.

3. Mubarak Zeb Khan, *Dawn*, Karachi, 16 March 2011

If official figures are to be believed, out of Pakistan's 1.7 million taxpayers, around 1.6 million taxpayers pay about Rs. 21,000 each as income tax every year. All of these people fall into the lowest tax bracket where their annual income tax is less than Rs. 500,000.

Even more interesting is the fact that this particular tax bracket has not gained many new entrants over the past three years; to be exact, statistics show that 1.663 million taxpayers paid less than Rs. 500,000 as income tax in 2008. This number went down to 1.478 million in 2009 and then back to 1.662 million in the tax year 2010. Clearly, over the past three years not many new taxpayers have stood up and been counted by the FBR.

This is not the only staggering statistic compiled by the Federal Board of Revenue; less than 20,000 people in Pakistan earned enough to pay between Rs. 1 million and Rs. 5 million (10 to 50 lakhs) as their annual income tax in 2010, while 21,077 taxpayers have paid annual income tax in the range of Rs. 0.5 million to Rs. 1 million (five to 10 lakhs) and earned the state exchequer a little over Rs. 13.5 billion.

This means that each of these 21,077 people paid an annual income tax of around Rs. 650,000. And this was

the income tax bracket with the second highest number of taxpayers. No wonder Pakistan is known for its low compliance level to income tax rules and international donors want the country to widen its tax base before asking the rest of the world for more aid and help.

Only 7,680 taxpayers earned enough to pay income tax in the range of Rs. 1 million to Rs. 1.5 million (10 to 15 lakhs). With a total collection of over Rs. 8 billion, each of these taxpayers contributed a mere Rs. 1.52 million to the government exchequer in the year. Around 3,000 taxpayers paid income tax between Rs. 1.5 million and Rs. 2 million (15 to 20 lakhs) a year while 2,414 taxpayers paid tax in the range of Rs. 2 million to Rs. 2.5 million (20 to 25 lakhs). For the next tax bracket, the number of taxpayers dropped steeply. Only 1,526 people paid tax in the range of Rs. 2.5 million to Rs. 3 million (25 to 30 lakhs) followed by 838 taxpayers who paid Rs. 3.5 million to Rs. 4 million (35 to 40 lakhs) as annual tax in 2010.

The number reduces to a mere 602 when it comes to people who paid more than Rs. 4 million to Rs. 4.5 million (40 to 45 lakhs) as annual tax. And only 526 taxpayers paid up to Rs. 5 million (50 lakhs). Each of them contributed Rs. 4.5 million (45 lakhs) to the government; this is less than the amount that one would need to purchase a Prado Land Cruiser. Also, there are only 4,426 taxpayers across Pakistan who declared income tax to be more than Rs. 5 million. However, FBR officials point out that this bracket includes corporate and other businesses.

Although the number of these taxpayers was low, their contribution in the total income collection stood at Rs. 286.023 billion during 2010 out of the total collection of Rs. 373.685 billion from 1,706 taxpayers. In other words, income tax collection from Pakistan's 1.6 million taxpayers remained Rs. 87.662 billion.

4. Shahbaz Rana, *Express Tribune*, Karachi, 24 February 2011

For every Rs. 100 collected by the Federal Board of Revenue in taxes, it misses another Rs. 79 due to tax evasion, said Salman Siddiqui, chairman of the FBR, while testifying before the Senate Committee on Finance and Revenue on Wednesday. The FBR estimates that the total revenue lost by the government as a result of tax evasion comes out to Rs. 1.27 trillion for the fiscal year ending 30 June 2011. This number is higher than the World Bank's most recent estimate of Rs. 796 billion and is equal to 8 per cent of the GDP, nearly equal to the worst case scenario for the projected fiscal deficit for the current year.

With numbers as astounding as this, a wide-ranging crackdown against tax evaders seems to be on the cards. The FBR detailed its plan to begin prosecuting evasion. 'The FBR has credible evidence against 708,600 tax evaders and a campaign against them will start from Friday', said Siddiqui. The number represents people who have taxpayer identification numbers, known as NTNs, but have not filed their tax returns. According to the plan, the FBR will give tax evaders a 30 day deadline to submit the details of their income and spending. If the evaders do not submit declarations voluntarily, tax authorities will issue a provisional tax notice with a two-month deadline to respond, following which the recovery effort will start.

The FBR plans to prosecute tax evaders using indirect estimates of their income and lifestyle. The ownership of movable and immovable property, foreign visits, and accounts in foreign banks will be used as evidence against suspected tax evaders. Siddiqui, however, was somewhat cautious about an aggressive campaign against tax evaders, fearing a negative impact on the economy. According to the FBR, over 70 per cent of all taxes evaded are corporate income taxes.

The Securities and Exchanges Commission of Pakistan has registered over 59,000 companies but only a little over 20,000 file their income tax returns with the FBR. The Senate committee's response suggested a degree of scepticism about the ability of the FBR to conduct an effective crackdown against tax evasion. 'My fear is that when the recovery campaign will be at its peak, the chairman of the FBR and his team will be transferred and that will be fault of the politicians,' said Senator Haroon Akhtar of the Pakistan Muslim League-Quaid. Other senators went even further, suggesting complicity between FBR officials and tax evaders. 'Tax evasion is not possible without the connivance of the FBR and the bleak scenario reflects that its efficiency is zero,' said Senator Ahmed Ali of the Muttahida Qaumi Movement, the chairman of the committee.

Siddiqui acknowledged that corruption within the department was a problem and pointed out that until some of the senior members of his team were not removed from their posts, the FBR would not be able to effectively prosecute evaders. He was also candid about the FBR's inability to meet its revenue targets for the current fiscal year, describing the collection of Rs. 1,667 billion as 'out of the question.' He put the more realistic figure at Rs. 1,586 billion, without any new measures to increase revenues.

5. Shahbaz Rana, *Express Tribune*, Karachi, 3 March 2011

The government is reluctant to give tax authorities the green signal to crack down on 700,000 tax evaders, even at a time when there is a shortfall in revenue collection. The February tax collection target was missed by a margin of Rs. 27 billion mainly because of a 10 per cent drop in direct tax collection, according to provisional statistics released by the Federal Board of Revenue (FBR). FBR managed to collect Rs. 103.1 billion in taxes against the target of Rs. 130 billion.

The shortfall is almost equivalent to what the government wants to collect by promulgating a new ordinance. The government is considering levying flood surcharge and doubling special excise duty rate in the ordinance to boost tax collection. Total tax collection in the first eight months of the current financial year (July–February) stood at Rs. 873.2 billion, a shortfall of Rs. 34 billion. Hence, the tax authorities are now facing an uphill task to collect Rs. 757 billion in the remaining four months. The FBR needs to collect an average Rs. 189.3 billion per month to achieve the target, which is 'over-ambitious' according to a former FBR chairman. FBR Chairman Salman Siddique said his goal 'is to achieve the year-end target of Rs. 1.63 trillion by all means.'

Statistics show that from the Rs. 873 billion collection, direct taxes were Rs. 309.4 billion, which is just 35.4 per cent of the total collection. A member of FBR said that the shortfall in income tax collection was Rs. 16 billion, indicating that something was wrong with the audit and income tax wings of FBR. The international community has largely stopped loan disbursements due to the government's inability to implement reforms. The budgetary support by the international community dropped to a mere Rs. 17.9 billion, shows the finance ministry's fiscal operation summary. The revenue shortfall compels the authorities to borrow from the central bank to finance the budget deficit that further fuels inflation.

On 23 February in a meeting of the Senate Standing Committee on Finance, the FBR chairman said that tax evasions amounted to 79 per cent of total taxes in the country. FBR had credible evidences against 708,600 tax evaders and would launch a campaign to net the evaders from 25 February, he added. Only 1.9 million people submit income tax statements out of the registered 2.9 million national tax number holders, a gap of one million.

The plan

'Everything from newspaper advertisements to provisional tax demands against the evaders is ready, but we are waiting for the green signal from the higher authorities,' says the FBR official. The FBR's plan requires approval of the Economic Coordination Committee (ECC) of the cabinet. ECC did not take up the issue of approving a framework to broaden the tax net in the meeting held on Tuesday. The authorities have chalked out a plan to collect at least Rs. 5 billion from the tax evaders during April to June this year. According to details, FBR will give tax evaders a 30-day deadline to submit details of their income and spending through media advertisements and if they don't, tax authorities will raise provisional tax demands with a two-month deadline to respond. If the people do not even turn up after the two-month deadline, provisional demands will be considered as a final tax liability and after that recovery will start.

FBR has obtained information from the data bank of the National Database Registration Authority (NADRA) while evidence is based on ownership of movable and immovable property, foreign visits, and accounts in foreign banks of the tax evaders.

6. Haris Zamir, *The News*, Karachi, 6 April 2010

Only 2.75 million Pakistanis, or 1.6 per cent of the country's estimated 160 million people, are registered taxpayers and posses the National Tax Numbers (NTN), FBR report said. Out of these NTN holders, only around two million people file their returns to the tax authorities, the report said. 'The compliance ratio has always been below. The share of taxpayers to population is low when compared with the few selected developing and developed countries, where the share ranges between 4.7 per cent and 86.4 per cent.' The report said that in India, the share of taxpayers to population is 4.7 per cent, in Argentina 16.5 per cent, France around 58 per cent. 'The share of taxpayers belonging to the non-corporate sector is close to 99 per cent in the total return filers. On the other hand, the corporate sector that contributes around 66 per cent in the total income tax collection has a share of only one per cent in the income tax base.'

Pakistan's tax collection has failed to improve since the late 1990s mainly due to inherent structural problems, including a narrow tax base, massive tax evasion, and administrative weaknesses, Federal Board of Revenue (FBR) said in its quarterly report. The report said that taxpayers distrust public institutions and the tax-to-gross domestic product (GDP) ratio had declined in recent years. But in fiscal 2009/10 (July–June), the tax-to-GDP ratio is expected to rise to 9.3 per cent from 8.8 per cent in 2008/09.

In order to ensure adequate public funding for the development and safeguard macroeconomic stability, the government plans to increase tax collection to 13 to 15 per cent of GDP in the next five years, the report said. This commitment is linked with the implementation of broad-based value added tax (VAT) from fiscal 2010/11, it added. 'International experience shows that tax reform can deliver large increases in the tax-to-GDP ratio. While there are other developing countries at Pakistanis income level with similarly low tax-to-GDP ratios, countries in the region set a different example.' 'The simple average of the tax-to-GDP ratio in Bangladesh, India, and Sri Lanka—countries with similar tax policies and administration—is systematically higher than Pakistan,' the report said adding that this gap increased during the present decade.

The reports said that Malaysia, India, Thailand, Turkey, and Sweden saw rapid growth and rising tax ratios, while in Pakistan tax collection rose just in line with the economic growth. In Asia-Pacific countries, the tax collection ratio increased from 13.8 per cent in 2000 to 16.5 per cent in 2004, while in Pakistan it remained roughly constant as a per cent of GDP since the early 2000.

Exemptions are made part of the tax system for a variety of reasons including the income tax threshold and GST exemption on basic foodstuffs are granted to protect the most vulnerable groups of society, the FBR report said. Exemptions are also introduced to protect certain industries, including those which are new, it added. 'There are also political exemptions (for) diplomats, top echelon of civil and military bureaucracy, and employees of the international organizations. Temporary exemptions are also granted to address issues that arise from time-to-time.' Tax exemptions are also given for the import of essential commodities to counter inflationary pressures, it said. 'The estimated total cost of all of the exemptions that could be around Rs. 200 billion, which comes to 3 per cent of the GDP.'

The report said that Pakistan needs to look thoroughly at the available reform options, pursuing twin-track reforms of tax policy and administration, which would help the government to meet its medium-term revenue collection targets. 'Different studies conducted on Pakistan taxation system highlight that Pakistan has the potential to achieve the objective of increasing the tax to GDP ratio by 13–15 per cent over the next five years.'

been State Bank of Pakistan's profit. The second major source has been Coalition Support Fund (CSF) from the United States of America, although this depends on Pakistan-US relations. The other heads of non-tax revenue constitute profits from Pakistan Telecommunication Authority and dividend from OGDCL, Pak Arab Refinery Ltd, and PSO. Other sources include possible potential of receipts from the eventual auction of 3-G Licences—see Tables 10.4 and 10.5.

The sales tax is a tax on consumption levied on manufacturers and retailers with an annual turnover of more than Rs. 5 million, as well as on importers, wholesalers, distributors, dealers, and specified services at a standard rate of 16 per cent, as approved in the Budget of 2012/13. However, some commodities are subjected to sales tax at 19 per cent and 22 per cent and there are others, such as basic foodstuff, agricultural produce (not subjected to any further process), medicines, books, and live animals, etc. which are exempted from the sales tax.

Petroleum products and edible oil remain the top revenue source of sales tax on imports. Within the domestic component of sales tax collection, the largest contributions come from POL products, telecom, services, natural gas,

sugar, and cigarettes. Domestic sales tax collection also benefited from the revenue measures announced in March 2011 when the sales tax was applied on the market price of sugar. Moreover, exemptions for sales tax on fertilizers, pesticides and tractors, and zero rating on plants, machinery, and equipment including parts, have also been withdrawn. Changes in what should be taxed take place periodically as and when the government decides.

In terms of collection from federal excise duties (FEDs), there are six major areas of revenue which include cigarettes,

beverages, POL products, cement, natural gas, and special excise duty. Almost 76 per cent of excise duty collection (domestic) is collected from these six commodities. Of the total domestic collection of FED, cigarettes and tobacco, cement, and services are usually the biggest contributors. The main source of customs receipts is from the duties levied on vehicles and from POL products.

Non-tax receipts of the federal government comprise of (i) income from property and enterprise, (ii) receipts from civil administration, and (iii) miscellaneous receipts of the federal ministries, divisions and departments.

The direct tax has contributed around 40 per cent of total tax receipts. The share of direct taxes in total federal tax receipts has increased from around 15 per cent in the early 1990s to 32 per cent in 2000/01, and was 40 per cent in 2009/10. The contribution of income tax in total direct taxes has been around 95–97 per cent. The structure of income tax is based on withholding taxes (WHT), voluntary payments (VP), and collection on demand (COD). The collection during 2009/10 shows that the share of WHT, VP, and COD in gross collection was 53 per cent, 29.5 per cent, and 17.5 per cent, respectively. WHT is the leading source of direct tax receipts given the large undocumented sector of the economy. Nine major withholding taxes contributed around 92 per cent of total WHT collection in 2009/10. These were: contracts, imports, salary, telephone, export, bank interest/securities, electricity, cash withdrawal, and dividends.

The sales tax was the second major revenue generation source of the country during 2009/10. It constituted around 65 per cent and 39 per cent of the collection of indirect taxes and total federal taxes, respectively, during 2009/10. The collection of sales tax has always been highly concentrated in some commodities, with only petroleum products and the telecom sector contributing more than 60 per cent of the total domestic sales tax. Ten commodities contribute almost 90 per cent of the total net sales tax from domestic sources, and include petroleum products, telecom services, natural gas, other services, cigarettes, sugar, electrical energy, beverages, tea, and cement. Like the domestic sales tax, the receipts of sales tax on imports are also concentrated in a few sectors. Petroleum products alone contributed around 40 per cent of overall collection of sales tax on imports during 2009/10. Despite the large-scale import tariff rationalization in the last two decades, with tariffs down to a maximum of 30 per cent, customs duty is still an important component of federal tax receipts. It contributed around 20.2 per cent and 12.2 per cent of indirect taxes and total federal tax receipts, respectively, during 2009/10. Federal excise duty is levied on imports and domestic stages. The major portion of the receipts emanates from the domestic sector. The base of the federal excise duty is quite narrow and is limited to a few commodities. Despite this narrow base, the federal excise duty contributed 9.1 per cent of total tax collection during 2009/10.

Table 10.6

Prior to the passing of the 18th Amendment and the 7th NFC Award, about 90–93 per cent of resources were generated at the federal level whereas only 7 per cent resources were generated by the provinces. Provinces relied on the federal government for meeting their expenditure requirements. In order to maintain inter-governmental fiscal relationships, Article 160 of the Constitution provides for setting up of the National Finance Commission (NFC) at intervals not exceeding five years. The mandate of NFC is to recommend to the President for the distribution of resources between the federal and provincial governments—see Chapter 13 for details on the NFC

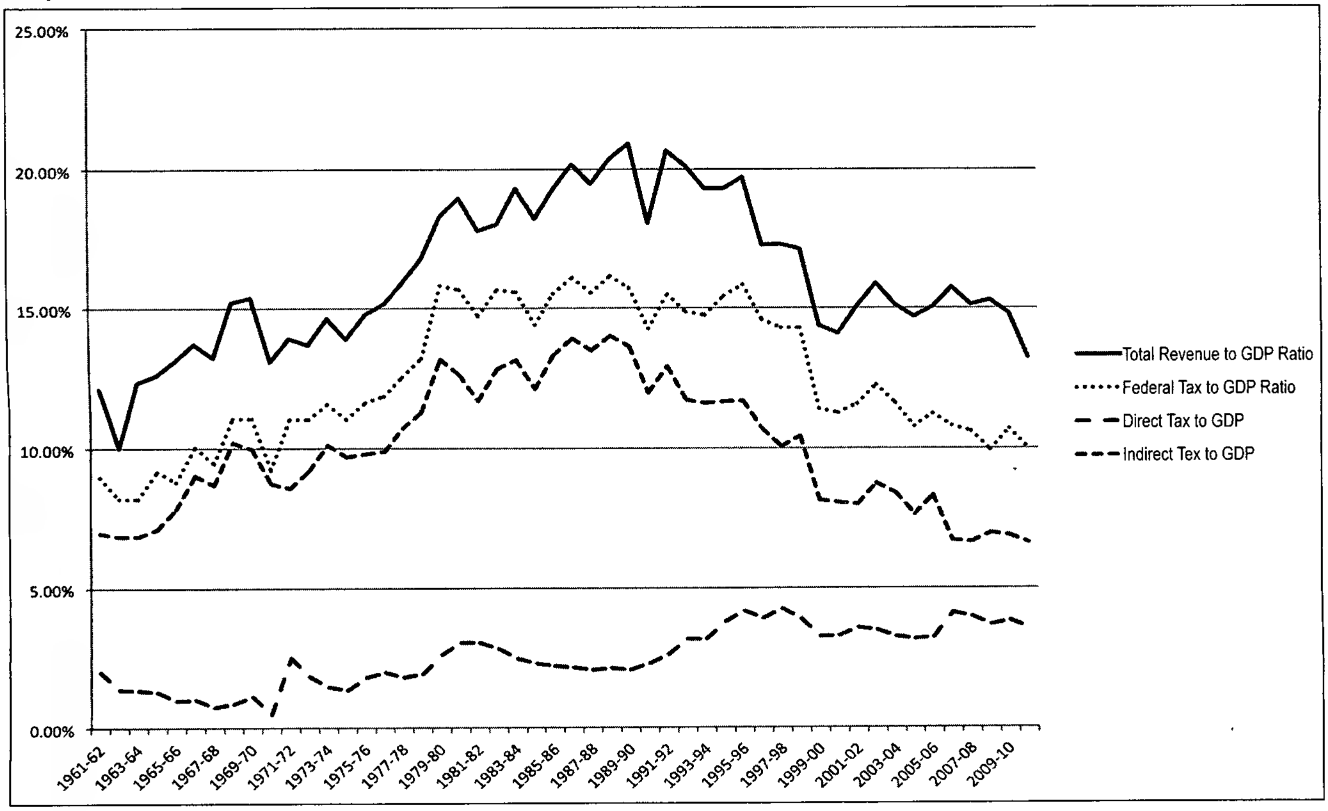
10.3 Public Finance: The Basic Facts

As has been the pattern in much of this book, having introduced the subject of public finance in Pakistan, we now present some data. This section is made cumbersome by the extensive nature of public finance statistics covering three tiers of government: federal, provincial, and local. Nevertheless, in order to appreciate the issues involved, a study of hard data is unavoidable.

Of the tables that follow, Tables 10.6 to 10.11 provide basic and historical information and data about the nature of Pakistan's public finances. Table 10.6 presents the expenditure and revenue pattern in Pakistan prior to the independence of Bangladesh. It shows that the main source of revenue has historically been from customs duties, i.e. taxation on trade. This should not be very surprising if Part II of this book has been studied, where the contribution of trade has been shown to be substantial in economic development. With high tariff barriers and import substituting industrialization, this is a logical outcome. Taxes from imports were, until recently, the main source of revenue for the exchequer. Another interesting figure on the revenue side in Table 10.6 is the contribution of income and corporation taxes. Despite the impressive industrialization and dynamic economic growth that took place in the 1960s, the contribution of income and corporate taxes actually *declined* as a percentage of total revenue receipts for United Pakistan. From 15.7 per cent in 1957/8, they fell to less than 6 per cent in 1970/1. The issue of income tax is discussed in subsequent sections of this book, but it seems that the pattern of tax evasion and underreporting may have been established very early in Pakistan.

On the expenditure side, it seems that Pakistan's was an economy of defence, with more than half of total expenditure being spent on defence from 1947 to at least 1970/1. In 1970/1, 53 per cent of total expenditure was on defence, a figure astronomically high by any standards. Because Pakistan's economy, up to the 1970s, was highly dependent on external resources in the form of aid, grants, and foreign debt, development expenditure was higher than non-development expenditure. In 1962/3, for example, of the total resources available to spend in Pakistan, as much as 73 per cent were external funds; in 1966/7, this figure was 74 per cent. As soon as the military government of Ayub Khan took control of Pakistan in 1958, the share of external

Graph 10.1: Revenue Statistics of Federal Government 1961/2–2010/11



funds in total resources jumped to over half. The arguments made in Chapter 6, that Pakistan's economy was highly dependent on aid and that much of the industrialization boom of the Decade of Development was foreign funded, are re-emphasized on the basis of public finance data for those years.[19]—also see Chapter 25.

To understand the nature of public finance statistics, Tables 10.7 to 10.11 provide a good introduction. Table 10.7 gives a basic overview of how the Government of Pakistan presents its consolidated provincial and federal government expenditure and revenue, and includes figures on development expenditure and on the extent of the fiscal deficit and its funding for each year. What is interesting from Table 10.7 is that even after 26 years of structural reforms, very little has changed, and in fact, in the case of tax revenues as a per cent of GDP, there is substantial deterioration. Tables 10.8 and 10.9 break down the revenue and expenditure statements of the government in greater detail.

In Table 10.8, we see that revenue from taxation is far greater than that from non-tax revenue, and that indirect taxes continue to be many times as large as direct taxes. Within the category of indirect taxes, import duties used to dominate by far, and provided the largest source of income to the government. This has all changed and has been one of the most significant changes in Pakistan's economy as a result of lowering tariffs and overall reforms. Today the sales tax is the largest source of revenue to the government. On the expenditure side (Table 10.9), development expenditure is far lower than current or non-development expenditure, and in 2011/12 was less than 19 per cent of total provincial and federal current expenditure. This pattern contrasts sharply with that seen in the period prior to 1971. The data also show that defence and interest payments accounted for more than half of all government expenditure. This issue is of key importance to the economy and politics, and is discussed in greater detail in this chapter and the next.

Since the figures in Tables 10.7 to 10.9 are in current market prices, a more useful indication of trend is a measurement of these figures with respect to a constant, say GDP. Table 10.10 shows how total revenue has fallen over the last decade and ranges around 9 per cent of GDP. Tax revenue is only around 6.8 per cent and is cause for serious concern. Figure 10.2 shows the almost unchanging trend and relationship between tax and non-tax revenue since 1986/7.

Shahid Kardar explains the range of the problems Pakistan has in collecting taxes, and argues, that Pakistan has one of the lowest tax to GDP ratios and, even considering developing countries alone, it is in the bottom ranked nations in terms of the proportion of population registered as taxpayers—less than 5 per cent of household population. There is rampant tax evasion, partly with the collusion of the official machinery. Whereas 3.1 million people have the National Tax Number, a mere 1.2 million filed an income tax return in 2010/11. What is even more startling is that of 47,800 companies that have NTNs, less than 16,800 filed an income tax return against 400,000 industrial electricity connections. As admitted by FBR, there is a tax gap of 79 per cent (the difference between potential revenues under the existing system and those

Graph 10.2: Expenditure Statistics of Federal Government 1961/2–2010/11

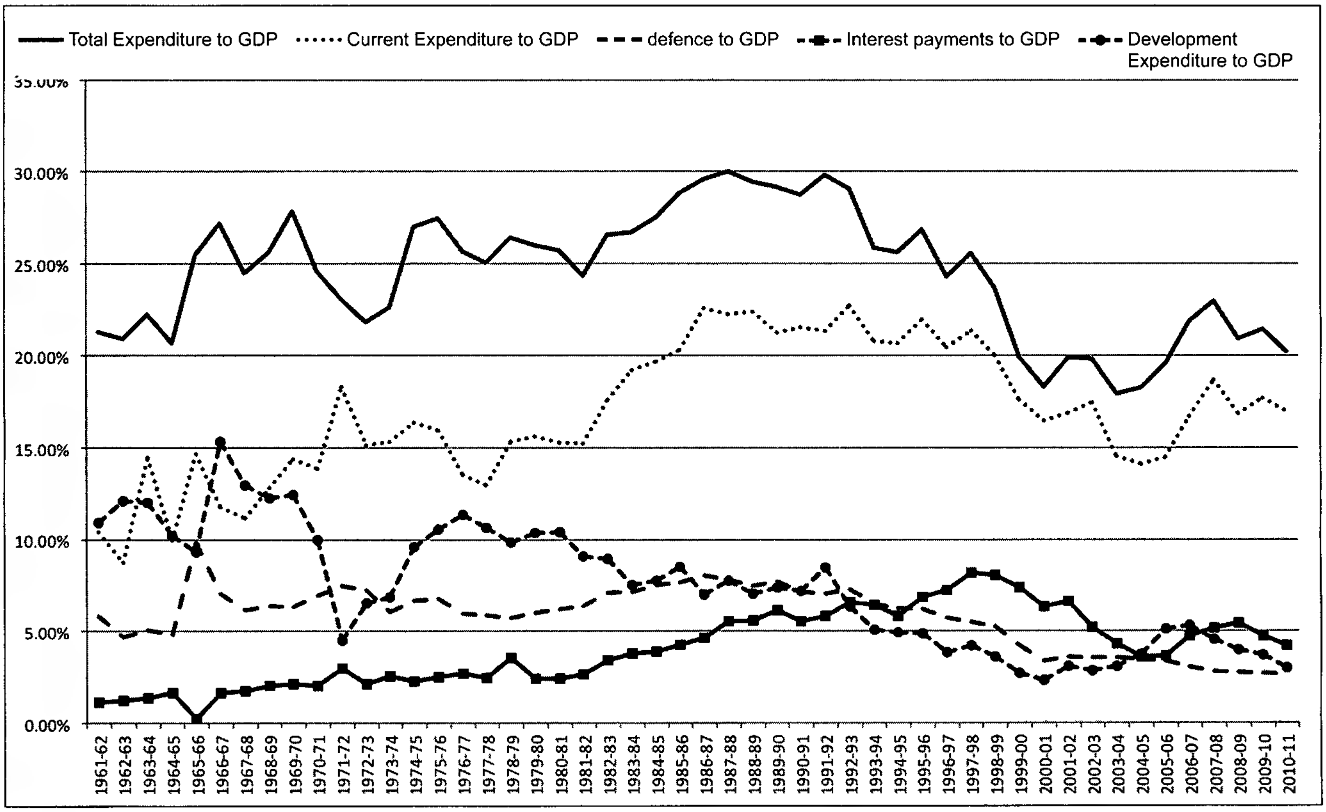
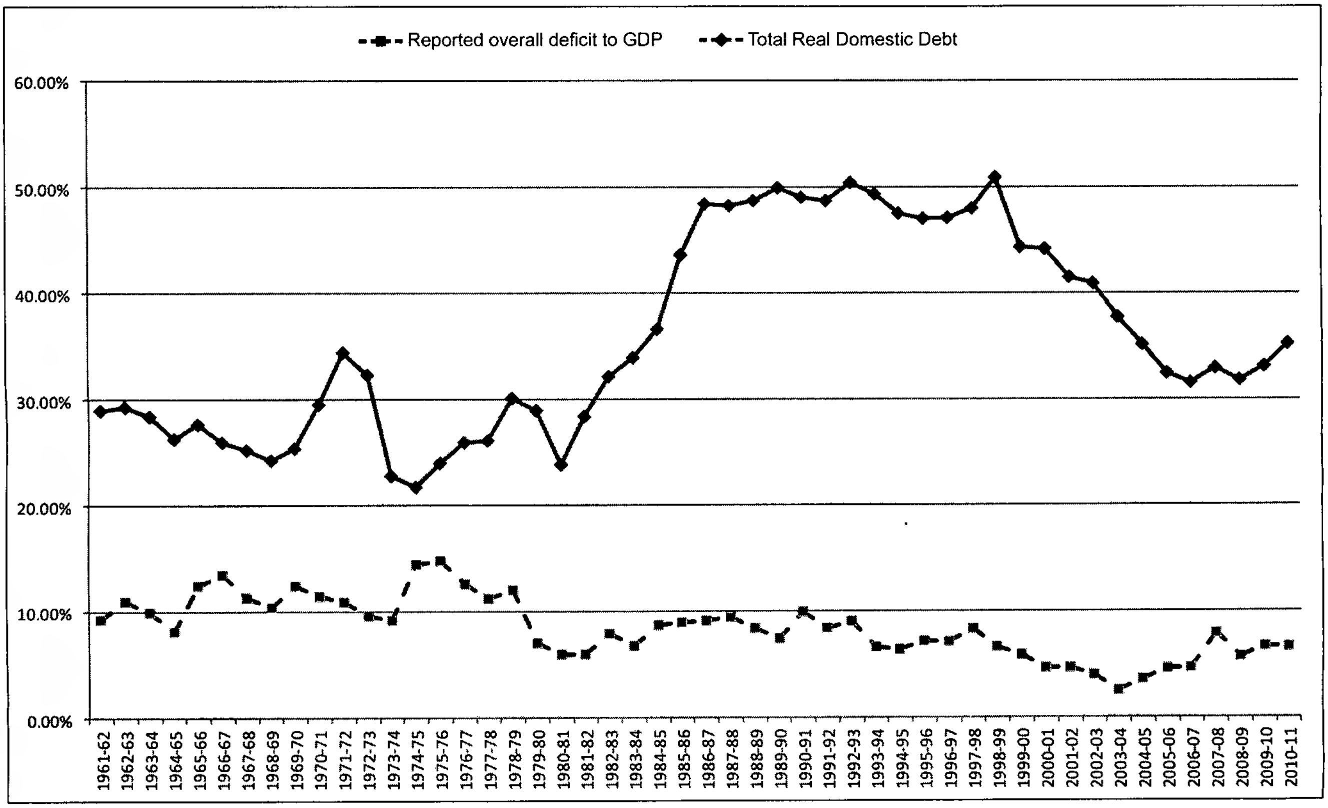


Graph 10.4: Fiscal Deficit and Debt Statistics of Federal Government 1961/2–2010/11



actually collected).[20] See Appendix 10.3 for a proposal to reform Pakistan's taxation system.

At the end of the fiscal year 2011/12, the size of Pakistan's economy was estimated at Rs. 20.653 trillion. Over the last decade, the tax-to-GDP ratio fell from around 11.5 per cent in 2002/3 to 8.5 per cent in 2011/12. Hence, if the tax-to-GDP ratio would have been maintained at even the low level of 2002/3, the additional tax revenue accruing to Pakistan's economy would be Rs. 600 billion, enough to address the energy crisis in terms of the outstanding circular debt. If Pakistan's proportion of taxpayers was the same as that of India's, a low 4.7 per cent of the population, then Pakistan's tax paying population should have been more than three times what it is today, and this when India's tax model has numerous problems similar to Pakistan's. See Box 10.3 for one of many assessments of Pakistan's tax-to-GDP ratio.

Table 10.11 shows how government expenditures have grown over time and the extent of allocation to different expenditure heads. One sees that while defence and interest payments have shown only positive, at times dramatic, increases over the previous year, development expenditure has even been cut, by equally dramatic amounts, in some years. What is more alarming from the lower panel in Table 10.11 is that the proportion of development expenditure in total expenditure, while very low, has continued to fall over the last decade with an increase in allocation, after having fallen markedly, in the last two years. Table 10.12 looks at these expenditure figures as a proportion of GDP, and shows that interest payments and defence consume almost half of total expenditure.

Having provided an overview of public finance statistics, we can now examine some of the key public finance ratios in Pakistan over a period of about fifty years, as shown in Table 10.13. While there has been some change in tax revenue as a proportion of total revenue in the last fifty years, the change has not been very substantial except in the last decade. Moreover, most ratios—those for direct taxes, indirect taxes—have not shown much change, although the nature and structure of the economy has changed considerably in fifty years. One should have expected changes in the revenue structure along with structural changes in the economy and the main change comes about due to a fall in customs duties over the last decade. There are significant changes, however, on the expenditure side, where debt servicing has increased quite substantially over the five decades. The dependence on external resources, if high in the 1960s and 1970s, was even higher at the end of the 1980s.

So far we have been discussing largely consolidated figures. Before we turn to a disaggregation of revenue and expenditure patterns at different levels of government, Table 10.14 shows us the degree and role of each level of government in revenue and expenditure. The federal government collected about 90 per cent of total revenue and of tax receipts, while the local government did as well as the provincial government, despite numerous constraints and obstacles in raising revenue. Since the federal government provided provincial government's funds, the provinces' share of development expenditure was greater than the revenue they raised. In 2001, while provincial governments collected 5 per cent of total revenue receipts, they spent 31 per cent

of total government expenditure. On the other hand, local government's share of total expenditure was about the same as the revenue it raised (see Figure 10.3). However, as Chapter 13 explains in greater detail, these proportions have changed after the 18th Amendment.

Tables 10.15 to 10.17 show in greater detail the federal government's revenue receipts over the last few years and provide a far more relevant comparison of the different types of tax and their shares. While the share of income tax has increased since 1983, as has that of the sales tax, indirect taxes still constituted almost 60 per cent of the total taxes collected in 2010. Figures 10.4 and 10.5 depict these changes

over time quite starkly. While the issue of income tax, the sales tax, and the proportion of direct to indirect taxes is discussed in greater detail in later sections of this chapter, it is interesting to see how Pakistan performs compared to similar underdeveloped countries. Table 10.18 provides such a comparison.

From the table it seems that, as GDP rises, the share of total taxes should also rise, and direct taxes, in particular, should play a greater role in the overall taxation structure of the country. Pakistan's tax effort is quite poor compared even with countries with similar levels of income, especially in the case of direct taxes. At 3.91 per cent of GDP, even poorer countries had a better tax effort than Pakistan. Indirect taxes do not vary all that much, although, not surprisingly, as income grows, foreign indirect taxes are also expected to increase. Hence, while a growth factor is important, tax effort and special effort also play an important role.

Like Table 10.12, Table 10.19 provides a similar comparison across five decades. Direct taxes have not shown much change, although indirect taxes, and in particular import duties, had increased substantially. There is also an increase in excise duties and the sales tax. Indirect taxes are often consumption taxes, which means that, as the economy grows and as the demand for and consumption of goods also increases, so does the revenue collected from the taxes on those goods. This is clearly visible from the table in the case of Pakistan, which corroborates the international evidence shown in Table 10.18.

Box 10.4 explains the measures of elasticity and buoyancy in the tax structure, and Tables 10.20 and 10.21 show the extent of both for some important taxes. The elasticity coefficient of a tax measures the built-in response of tax revenue to growth in income, without any change in the tax rate, while the buoyancy coefficient measures the total responsiveness in the tax revenue to the growth of income, inclusive of changes in tax revenue. Table 10.20 shows that except for the sales tax, and for income tax during 1972/3 to 1980/1, the elasticity figures were less than 1, implying that a 1 per cent increase in income increases tax revenue by less than 1 per cent. Customs duties and the sales tax had a buoyancy of more than 1, while excise duties and income tax had a less-than-1 buoyancy, implying that inclusive of all

Tax and Non-Tax Revenue: 1986–2013 (% of GDP)

Box 10.3

FBR and the Tax-to-GDP Ratio

1. The frequent changes in tax legislation have distorted the overall tax structure, which has played a key role in lowering tax-to-GDP ratio in Pakistan. Sources told *Business Recorder* here on Wednesday that a report on the tax gap analysis revealed that frequent changes in tax legislation has made the overall tax structure incoherent and tax base narrow: Tax policy reform in Pakistan has often been piecemeal and disconnected.

   Many changes in the tax system were either made to cater to the interest of specific economic sectors or firms, or introduced as matter of administrative convenience, as was the case of zero rating of five sectors. The government does not know the revenue losses of the incentives given, and has no rigorous system to evaluate the objectives and benefits.

   These policies have contributed to the narrowing of the tax base and the decrease in tax effort. They have also compromised the fairness of the tax system, reduced voluntary compliance and increased tax. Sources said that the main problem with the tax system is its sustained inability to raise adequate revenue to finance the public sector budget. In fact, over the 2000s tax revenue has barely kept pace with GDP, and the tax revenue to GDP ratio even declined in the last years of the decade. Based on international comparisons, Pakistan is a low taxing country. Given the large development needs for social services and public infrastructure, there remains a structural fiscal gap equivalent to about five per cent of GDP.

   The efficiency costs of the tax system to the economy are high: Pakistan''s tax system levy taxes on different economic sectors and types of assets at very different marginal effective tax rates, which create significant distortions. Although some distortions may be intentional, the real consequence of the distortions is that many investment decisions are guided by tax considerations as opposed to economic considerations.

   The result is an overall less efficient allocation of resources and lower levels of output and rates of economic growth for Pakistan. These distortions are caused, among other issues, by the favourable treatment of certain investments and sectors.

   The report said that currently, the tax laws are such that individuals with the same income or businesses with the same profits can be treated very unequally in terms of the final taxes the law requires them to pay. This report shows that gap estimates vary widely across sectors. The horizontal unfairness of the tax system is exaggerated by the uneven application of tax enforcement: while compliant taxpayers bear the full burden of taxes, the failure of tax enforcement mechanisms allows other taxpayers to evade their taxes with a large degree of impunity.

   Even though the basic structure of Pakistan's tax system is broadly in line with international practice, these taxes have become more complex over the years, because of exemptions, other preferential treatments, and ad hoc changes to the structure of those taxes. The extensive use of withholding taxes, often being considered a final tax—as opposed to being adjustable against final full liabilities—has added to the complexity and arbitrariness of the tax system. The inadequate standards in maintaining tax data do not allow a complete study of the impact of these distortions, sources said.

   In spite of partial reforms, there is a long way to go to fully modernise the tax administration. This long-standing bottleneck is characterized by over-reliance on easier 'tax handles' through an extensive system of withholding taxes, inefficiencies in administrative structure and operations, and weak enforcement. Around 58 per cent of the legal tax base still goes untapped. The situation gives rise to the inadequacy of revenue yields and loss of confidence in the fairness of the system due to large horizontal inequities, sources added.

Source: Sarfaraz, Sohail, 'Tax-to-GDP Ratio Lowered', *Business Recorder*, 15 March 2012.

2. The Federal Board of Revenue (FBR) has identified factors like exemptions and narrow tax base as major reasons for high tax gap in Pakistan.

   Tax gap analysis has revealed that there are several factors contributing to the high tax gap in Pakistan. The structural problem, such as a narrow tax base due to exemptions exists with tax evasion and distrust of public institutions, and administrative weaknesses, all also taking a toll on tax collection. Recent reviews of tax returns reveal that even compliant taxpayers do not provide essential information in the returns. Due to these discrepancies in the returns, a number of opportunities for underreporting income or claiming lower rates and liabilities are generated. As better quality data becomes available, a more refined analysis will be possible to highlight specific issues in individual sectors.

   International experience shows that tax reform can deliver large increases in tax effort. The countries with income levels comparable to Pakistan generate higher tax-to-GDP ratios. The simple tax-to-GDP ratio in Bangladesh, India, Nepal and Sri Lanka are systematically higher than Pakistan's despite these countries having similar tax policies and administrations.

   In Asian and Pacific countries overall, central government tax collections increased from 13.8 per cent in 2000 to 16.5 per cent by middle of the decade, it remained almost constant in Pakistan and then declined with the global economic crisis.

   Sources said that the gap analysis in the report corroborates the worries that tax revenue in Pakistan is raised in an inefficient way, favouring certain sectors and economic activities over others. Such incidence of taxation can deter people from investing the most productive sectors and earning more from the resource available and ultimately adversely affect economic growth. Some sectors are much more heavily taxed compared to their

contribution to GDP than other sectors. It is already known that about one fifth of GDP comes from agriculture, yet this sector yields no more than 1 per cent in FBR revenues. Services make up almost half of economic value added, but generate only one quarter of central taxes due to the low tax receipts from wholesale, retail, and transport. Given the shortfall in agriculture and services, industry carries the brunt of the tax burden—its tax share is three-times as high as its GDP share.

Within the industrial sector the variations in tax gap estimates demonstrate the unequal incidence of taxation. In addition, there are question marks to what extent the tax system, through the way it treats different income classes of people differently, is sufficiently equitable. While some progress has been made, Pakistan's tax code remains complicated and most taxpayers have little knowledge of their obligations, sources referred to the report.

Sources said that Pakistan can take measures to increase the tax to GDP ratio by around 3.5 percentage points over the medium-term. In order to ensure a healthy long-run economic development, Pakistan needs to embrace substantial changes in tax policy aimed at increasing the buoyancy of the tax system, broadening the tax base. The measures like reduction in distortions and phasing out exemptions will contribute to closing the tax gap. Such tax reforms are also required to deal with the risks stemming from sustained large budget deficits, sources added

Source: *Business Recorder*, 15 March 2012. This news item has been slightly edited.

the discretionary measures, a 1 per cent increase in income, would result in less than 1 per cent change in tax revenue. The reasons for the low elasticity include the presence of a large black economy and tax evasion, the presence of a wide array of exemptions, and a poor and corrupt tax administration system.

We can now move from federal taxes to the provincial tax structure. As explained earlier, the NFC award of 1991 suddenly put all four provinces into a surplus position, as seen in Table 10.22. However, what the table reveals is that provinces' own revenue effort fell appreciably after 1990/1, and development expenditures, which were mainly the responsibility of the provinces (see Table 10.23) either decreased, as in the case of the Punjab, or did not show much improvement, in the other three provinces. Education, health, and water supply and sanitation were the main sectors where the provincial governments dominated, and in 1991 overall 64 per cent of expenditure on the social sectors was incurred at the provincial level. Table 10.24 nevertheless, shows that considerable effort to increase revenue had been made. All the provinces made considerable progress, especially Sindh, which registered double-digit growth in almost all taxes. Karachi's contribution in raising revenue for the whole of Sindh is likely to be quite substantial. The increase in electricity duty, due to Karachi's very large industrial and population base, that for hotels due to Karachi's dominance of larger hotels, and other duties, such as on stamps and on property mainly from Karachi, have in all likelihood resulted in this increase for Sindh overall.

Table 10.25 is an extensive summary of most fiscal indicators from the period 1961/2 to 2010/11, and Figures 10.6 to 10.9, visually demonstrate some key trends from the table.

Let us now turn to the more substantive issues in the taxation debate and examine the causes of many of the ratios and the consequences of some of the trends discussed in this section.

10.4 Key Issues in Taxation

10.4.1 Federal Taxes

Hafiz Pasha summarizes the key features and problems of the (federal) tax system as follows:

> Pakistan's tax system is characterized by a number of structural problems. First, the overall level of fiscal effort is low and the tax-to-GDP ratio has remained, more or less, stagnant

at between 12 to 13 per cent. This is one major explanation why budget deficits have been high, generally in excess of six per cent of the GDP. Second, there is overdependence on indirect taxes, which until recently accounted for a share in revenues of over 80 per cent. This has increased the regressivity of the tax system and imposed a higher excess burden of taxation. Third, within indirect taxes there is domination of taxes on international trade, which has promoted inefficiency, distorted the allocation of resources and encouraged illicit trade. Fourth, the effective tax bases of most taxes is narrow due to wide ranging exemptions and concessions and rampant tax evasion. For example, there is less than one income tax assessee per 100 persons and less than 60 per cent of imports actually pay duty. Consequently, tax rates have had to be pitched at high levels which has created a vicious circle of more tax base erosion and higher tax rates. Fifthly, tax administration is characterized by primitive and out-moded procedures, complex laws and considerable arbitrariness and discretion. The common perception is one of high levels of corruption and inefficiency.[21]

The World Bank, in its extensive evaluation of the economy prior to the commencement of the first major Structural Adjustment Programme of 1988,[22] identified the issues of resource mobilization and the budget deficit as amongst the most important. Revenue generation was to be given special emphasis in any sort of adjustment programme, as the World Bank argued that, unless this area of the economy was put in order, much of the rest of the efforts would also fail (see Chapter 11 and Part VI of this book). Many years later, following the 2009 IMF stabilization loan, the programme was cancelled in 2010 by the IMF, because Pakistan was not able to raise revenue through new taxes in the form of a

Value Added Tax. Revenue generation has been a perennial problem in Pakistan, one which is at the core of taxation and the political economy of revenue generation.

The World Bank report argued that the budget potential of an increase in resource mobilization comes from strengthening Pakistan's tax base, since tax revenues accounted for only 13–14 per cent of GDP, a figure far less than that of other countries at similar levels of development, which, as Table 10.25 shows, has fallen considerably from even this dismal figure. The income elasticity of the tax system is low because of the very narrow tax base and the large number of exemptions given in sales tax, excise duty, income tax, and customs duties. The pre-Structural Adjustment Programme report emphasized that there was a need to 'broaden the tax base and increase the elasticity of the tax system by shifting the emphasis in indirect taxes towards domestic consumption

(of both domestic and foreign products) and raising the contribution of the income tax'.[23] An extension of the sales tax to transform it into a consumption-type value added tax (VAT) needed to be imposed at the manufacturers' level. A theme which continues to be repeated in most analysis of the taxation structure, the need to subject agricultural income to taxation, was also identified by the World Bank. All subsequent analyses of the taxation and revenue system of Pakistan, have underscored these problems—see Boxes 10.5 to 10.7 for key issue and constraints in Pakistan taxation system.

While the need to increase direct taxes as a share of total tax revenue has been an important realization, attempts to change the structure of indirect taxes have found equal emphasis. With trade taxes by far the key feature of Pakistan's taxation regime in the past, Pakistan's resource mobilization efforts have been subject to impacts not necessarily of Pakistan's own doing. Hence, the need to develop another sort of tax that is consumption based and domestic. The World Bank report identified the need for a sales tax and highlighted various problems prior to attempts to remedy them in the Structural Adjustment Programme of 1988:

> The objective for indirect taxation is to shift the emphasis from imports toward a broad-based tax on domestic consumption that is neutral between products made in Pakistan and imports. This would involve a modification of Pakistan's present *sales and excise taxes*. In principle, all goods produced/manufactured in Pakistan and sold wholesale are now subject to a sales tax, but practice has differed from principle. So many products have been granted exemptions that the sales tax now resembles a special consumption or excise tax rather than a broad-

> based consumption tax. In addition, differential coverage and differential rates between domestic products and imports (with higher rates for imports) have meant that the tax has 'protective effects' in addition to those generated by the tariff system. In the FY87 budget, the rates for domestic products and imports were made equal, but unequal coverage still leaves some protective effects intact. Cascading of the sales tax through several stages of production has been avoided in Pakistan by making taxes on inputs deductible from taxes on outputs, similar to the procedures under a value-added tax (VAT).
>
> The simplest way, administratively, to develop a broad-based consumption tax would be to expand the coverage of the existing sales tax by drastically curtailing the number of exempted manufactured products. The present sales tax taxes domestic products and imports at the same rate (except for the differential coverage), covers imported goods extensively, and allows taxes paid on inputs to be credited against taxes paid on outputs. Cutting the excessive number of exemptions would serve the objective of increasing the tax burden on domestic consumption.[24]

A key feature of the change in the taxation structure suggested was to cut the excessive number of exemptions under the existing taxation regime, which would then fulfil the objective of increasing the tax burden on consumption. The emphasis was on implementing VAT—a 'manufacturer's level consumption-type VAT'. This shift from a sales tax to a value added tax would require the extension of the coverage of taxation to almost all products at the manufacturers' level and would tax domestic and imported products at the same rate (see Appendices 10.3 and 10.4 in the first edition of *Issues*). This need to establish a Value Added Tax has continued for many years, and lead to a suspension of the 2008 IMF programme—see Box 10.6.

In the Structural Adjustment Programme of 1988, a number of measures regarding the sales tax were undertaken (see Table 10.26). A gradual extension of the coverage of the sales tax on imported and domestically produced goods began. More and more commodities came under the sales tax and items previously exempted were now taxed. The adjustment programme envisaged a fully-fledged general sales tax (GST)—very much like a value added tax—by the end of the programme in 1991. The tax was extended quite substantially from the manufacturer/importer level to wholesalers and retailers for some products. However, the evaluation at the end of the Structural Adjustment Programme revealed that 'the expansion in the tax base . . . remained significantly less than what was initially envisaged, both in terms of the sectoral coverage and the number of taxpayers'.[25] There were many political considerations and constraints which continue to make the GST or VAT a very difficult tax to impose (see also Appendices 10.3 and 10.4). Moreover, Hafiz Pasha identified a number of problems with the large-scale introduction of a full scale VAT in Pakistan. He argued that

> there are some basic problems with the large scale introduction of VAT in Pakistan. First, in the absence of proper accounting and documentation of transactions, especially by smaller manufacturing and trading entities, enforcement of the tax becomes difficult. Also, there appears to be some reluctance on the part of large-scale units to accept tax invoicing of inputs and outputs because of the fear that furnishing of this information will also enable better determination of income

tax liabilities and thereby limit possibilities of evasion. Second, there is a degree of political reluctance to levy GST on the consumption of goods like tea, vegetable ghee, etc. Third, there is a constitutional restriction on the extension of sales taxes to services by the federal government in Pakistan. This implies that the GST cannot be levied on major service inputs like power, gas, transport, etc. and as such it is impossible to make GST correspond to a true value added tax in the absence of an appropriate constitutional amendment.[26]

Nevertheless, as numerous tables have shown in this chapter, import duties have been replaced as the main source of revenue for government by a sales tax now at 16 per cent. Now 42 per cent of government revenue comes from the sales tax, while customs duties provide only 15 per cent.[27]

Direct taxes still form a small part of the total revenue collected by the federal government, and income tax constitutes as much as 95 per cent of direct taxes, yet it suffers from numerous deficiencies. There is a very poor coverage of taxpayers, a narrow tax base is riddled with exceptions and exemptions, and the income tax procedure

Box 10.4

The Elasticity and Buoyancy of Taxes

The elasticity and buoyancy of taxes helps determine how changes in the economy will impact on revenue.

The measure of *elasticity* of a tax system gives the automatic or natural responsiveness of tax yields to changes in national income. It is defined as a percentage change in total yield (or yields of individual taxes) associated with a given percentage change in GDP (or the relevant GDP component) without any change in the statutory rate of existing tax(es), in administrative efficiency or due to the introduction of new taxes.

Buoyancy measures the total response of revenue from a tax or taxes due to a change in income. It shows the growth that results from automatic growth of the base caused by the increase in GDP and from discretionary tax changes. The buoyancy of a tax system or individual tax is usually greater than or equal to the elasticity because tax rates are usually increased over time.

The magnitude of the elasticity depends on the level of tax rates, the progressivity of the rate structure, whether tax rates are specific or *ad valorem* in character and the change in the tax base due to changes in income. For the purpose of analysis, it is usually possible to break up the coefficient of elasticity into tax-to-base and base-to-income components. The first gives the responsiveness of tax yield to a change in tax base and the latter encompasses the effect of changes in base due to change in income.

The value of the tax-to-base elasticity depends on tax rates and the progressivity of the tax structure. If the rate structure is progressive or if there is an improvement in tax administration then the tax-to-base elasticity is likely to be high, thereby implying a higher overall elasticity. However, if high marginal tax rates induce higher evasion and corruption in tax payment then the tax-to-base elasticity is likely to be lower. Alternatively, if tax rates are specific rather than *ad valorem* then revenues may not rise proportionately with the increase in tax base and the elasticity in this case would be less than unity.

The base-to-income elasticity primarily depends upon the nature of the relationship between changes in income and changes in the tax base. This elasticity can be assumed to be largely exogenous and beyond the control of the tax collecting agency. In contrast to this, the magnitude of the tax-to-base elasticity can be influenced by policy action.

The elasticity of the entire tax system at any particular time is the weighted sum of the elasticities of the individual taxes, with the weights corresponding to the revenue shares. If the share of elastic taxes is higher, then the overall tax system will be more elastic.

is badly integrated with company law. The large number of exemptions have 'traditionally been justified as incentives for investment, saving, exports, regional development, etc.'.[28] Only 3 million income taxpayers in a population of 180 million exemplifies the extent of tax evasion in the country, and according to one observer, as many as three-quarters of potential taxpayers in Pakistan do not pay taxes.[29] According to another estimate, it is estimated that the evasion of income tax is almost five times the collected amount.[30] Hence, the 'collection of income tax has remained restricted largely to the industrial and financial sectors, to public limited companies and multinationals, to corporate profits and salary income and to the metropolitan cities of Pakistan'.[31] Also see Box 10.2 and Box 10.6, and Appendix 10.3 on the income tax.

To be able to have a more broad-based income tax, it would be necessary to have proper documentation of the economy and to do away with the numerous exemptions, as well as to streamline the taxation structure so as to make it easier to catch tax offenders. However, given the fact that the tax administration is highly corrupt and often in collusion with tax evaders, even if an effective income tax structure were imposed, it is likely that the real culprits would be able to get away, and only the smaller offenders would be caught, as is often the case. Nevertheless, the reform of tax administration, irrespective of cultural and structural problems such as pervasive and excessive corruption, is a minimum condition that must be fulfilled if any worthwhile

Table 10.21
Decomposition of Buoyancy of Major Taxes

Federal taxes	Tax base	1972/3 to 1989/90			1972/3 to 1980/81			1981/2 to 1989/90

measures towards better tax effort and resource mobilization are to take place (see Appendix 10.4 and 10.5). At the same time, it is important to emphasize that there are numerous vested interests in maintaining the status quo who may be unwilling to permit any sort of change (see Boxes 10.5 to 10.7).

10.4.2 Resource Mobilization at the Provincial Level

Prior to the changes initiated in the 18th Amendment and through the 7th NFC Award which will have an impact on resource mobilization, almost 90 per cent of revenue was collected at the federal level and the remaining 10 per cent distributed between the two lower tiers of government, yet the role that both provincial and local governments played in the delivery of services prior to the 18th Amendment was often critical. Social services, in particular, such as education, health, and water supply and sanitation, were provided by provincial and local governments, hence the need to examine issues particular to resource mobilization (see Table 10.23). After the 18th Amendment, that role of provincial government has been much enhanced, and due to the 7th National Finance Commission Award of 2009/10, so have the financial resources available to the provinces.

Provincial governments had access to resources from a divisible pool of federal taxes for their recurring account, as per the prescribed formula of the earlier National Finance Commission awards. In that award, 37.5 per cent of revenues of the federal government income tax, export duty on cotton, excise duty on tobacco, and the sales tax were given to the provincial governments on the basis of their population share. Prior to the 1991 NFC award, the federal government used to fulfil the deficit financing component of the provincial governments in the form of grants-in-aid or loans. At their peak, in 1987/8, these grants were worth Rs. 17 billion or 2 per cent of GDP. However, the 1991 Award stopped such payments from the federal government to the provincial governments, and there was greater pressure on the provincial governments to put their house in order and to self-finance their revenue deficits.

Aisha Ghaus and Asif Iqbal identified the following problems in the provincial resource mobilization structure which existed prior to 2010, although similarities still exist post-2010.

1 Limited scope of resource mobilization as the large and relatively buoyant taxes, such as import duties, income and corporate tax, excise duties and sales tax, have been 'pre-empted by the federal government. The taking over of the sales tax, in particular, by the federation soon after partition has been cited as a major encroachment on provincial fiscal power.'[32]
2 The Islamization process has caused loss of revenue from provincial excises, entertainment tax and land revenue.
3 Provincial governments have not been able to exploit the agricultural income tax, tax on value added in the services sector and capital gains on immovable properties.

Table 10.24
Annual Compound Growth Rate in Tax Revenue by Province: 1990/1 to 1994/5 (%)

Tax	Punjab	Sindh	NWFP	Balochistan	Pakistan
Stamp duty	0.1	23.9	25.1	10.0	7.5

Source: This table has been provided by Fahd Ali.

4 The elasticity of provincial taxes is low, which means low growth in tax revenue.

5 'The incentive environment prevalent in the country has not been conducive to greater fiscal effort by the provinces. Automatic access to ad hoc revenue deficit grants provided an opportunity to the provincial governments to declare higher revenue deficits (by lowering own revenue effort and by raising expenditure) and thereby receiving a higher grant from the federal government.'[33]

6 Poor tax administrators.

With pressure on them, surprisingly, provincial governments tried to deal with having to raise revenue and meet their deficit requirements. The provinces, since the 1991 NFC award, 'adopted a diversified resource mobilization strategy focusing on most of the existing taxes like stamp duties, property tax, motor vehicle tax, hotel tax, tax on professions, trading and callings, electricity duty, paddy development fee, cotton fee and land revenue'.[34] This was done by removing exemptions and by expanding the tax net. Those tax rates which were very low were enhanced, such as stamp duties, motor vehicle tax, paddy fees, cotton duty, and electricity duty. Also, there was a switch from specific to ad valorem taxes. The consequence of these measures had been a considerable increase in the growth rate in provincial tax revenues between 1990 and 1995, especially in Sindh and the NWFP (see Table 10.23).

Aisha Ghaus and Asif Iqbal conclude their evaluation of the substantial changes in the provincial governments' resource mobilization strategy since the 1991 NFC award on a positive note. Although they add that these reforms constitute only a 'small step in the right direction' and much more needs to be done, their overall analysis was as follows:

> On the whole, it appears that the tax reforms introduced by the provincial governments in the last few years will broaden somewhat that provincial tax base, introduce an element of buoyancy in tax revenues and reduce revenue leakages. On top of this, given the nature of provincial taxes like stamp duties, property tax, etc. with a heavy concentration on physical and financial assets the incremental burden of most of the reforms is likely to be on the upper income groups and, therefore, the reforms will increase the progressivity of the provincial tax system. Also, the reforms are unlikely to have had a significant impact on the price level of basic goods.[35]

These efforts at reform and improvement notwithstanding, there were numerous problems and issues regarding provincial resource mobilization measures which had not been addressed and even after post-2010, continue to persist. The urban immovable property tax was a case in point.

This tax is dependent and based on the gross annual rental values (GARVs) of properties, with assessment by the provincial governments due every five years. None of the provincial governments regularly revised its assessment every five years, and the last actual assessment in the province of

Table 10.26
Taxation and Expenditure Proposals according to the Structural Adjustment Programmes: 1988–1991 and 1993–1996

Policy areas	Objectives and targets	Strategies and measures
Structural Adjustment Programme, 1988–1991		
Overall deficit	Achieve a reduction in the overall fiscal deficit/ GDP ratio to 4.8 per cent by the end of the programme period; reduce budget's dependence on private savings and domestic bank borrowing.	Major improvements in overall revenue performance and tight control of expenditure growth.
Revenue	Foster domestic resource mobilization in order to achieve a sustainable level of development and essential current expenditures aimed at maintaining high economic growth in the context of economic and financial stability. Achieve an increase in the revenue/GDP ratio to about 20 per cent by the end of the programme period.	Begin to implement a tax reform directed at expanding the tax base and at increasing tax elasticity; continue the strengthening of tax administration. Extension of sales tax on about 22 per cent of domestic industrial production. Extension of sales tax on 30 per cent of domestic industrial production. Increases in telephone charges. Extension of ad valorem excise on certain services such as travel. Annual revision in those excises which are at specific rates so that there is revenue elasticity. Initiate a programme of action to prepare for the introduction of a general sales tax (GST) by 1 July 1990. Proceed with the implementation programme of action. Effective implementation of the general sales tax. Guidelines issued to income tax panels to set criteria for initiating prosecution against tax evaders. Maintain income and profit tax exemption limits at current levels. Review experience of self-assessment procedure for taxpayers earning less than Rs. 100,000. Removal of most exemptions from the standard customs 1989/9 duties, except for duty drawbacks for exports and incentives for industries as given in the 1988/9 budget. It is the authorities' intention that these exemptions will not be extended beyond 1990/1, except for backward areas as defined in the 1988/9 budget. Continue implementation of tax reform.
Structural Adjustment Programme, 1993–1996		
Budget	Improve structure of the budget and revenue elasticity.	In GST following measures are to be implemented by 1 July 1994: Removal of exemptions for mostly locally produced goods and imports (except basic foodstuff, medicines, fertilizers, and pesticides). Elimination of capacity scheme within the framework of GST. Introduction of turnover threshold for registration as taxpayer. All specific rates and assessments based on official prices and lower rates for manufacturers that do not claim tax credit to be eliminated. Evaluation of VAT to firms in trading and services sector by 1 July 1994. Excise regime will be rationalized.
Direct taxes	Reduce the wide-ranging exemptions and concessions. Extend coverage to agricultural sector 1993/4; further expand the base 1994/5. Simplify the rate structure for direct taxation. Contain basic personal exemptions and provisions concerning employee benefits. Unification of corporate profit tax rate. Reduction of tax holiday provisions. Transfer the current presumptive tax provisions relating to supplies, contract, imports, and exports into an advance payment for regular income tax.	
Indirect taxes	Reduce maximum tariffs. Import licence fee requirement to be eliminated by 30 June 1994. Eliminate export taxes by 30 June 1994. Conversion of GST into modern broad-based VAT through significant expansion in the number of registered taxpayers, extension of horizontal and vertical coverage, and removal of exemptions.

Box 10.5

Vested Interests and the Taxation Structure

Hafiz Pasha argues that the taxation structure needs to be seen in the context of different interest groups active in the economy. He writes:

> Behind each major tax exemption or concession there is a strong, entrenched vested interest group in Pakistan. Each group has organized itself as an effective lobbying entity, which has not only blatantly demonstrated its power in political terms, but in more subtle terms also has played the game of patronage seeking through party donations, supporting influential politicians, etc. and developed credible arguments for the retention of these exemptions and fiscal incentives in the greater national interest.
>
> Perhaps the best example of this is the agricultural lobby. It is extremely well organized and enjoys enormous political power. Over 80 per cent of the elected members of the parliament either represent the feudal class or are sympathetic to the interests of this group. It is not surprising, therefore, that any legislation to change the status quo is effectively blocked. A number of arguments have also been developed to justify the exemption of agricultural income tax [including] the fact that the sector is already 'overtaxed' through the pricing mechanism (domestic prices below world prices), that food production is vital for national security and that the high costs of collection of the tax on agricultural income will not be justified because of the likely low revenue yield [see also Chapter 5].
>
> Tax holidays have been aggressively supported by industrial interests who have formed an alliance with the provincial governments of backward areas. They have been successful in playing up the sensitive issue of large and widening regional disparities in the country. The Ministry of Finance (a key agent of the state itself) has justified the exemption of interest income on government savings instruments on the ground that this actually improves the income distribution because the bulk of participation in such savings schemes is by lower and middle income households, and that this incentive reduces the need to resort to inflationary mechanisms for financing the budget deficit.
>
> The need for retention of the capital gains on financial assets has been successfully argued by representatives of stock exchanges in the country. Various associations of members of stock exchanges have portrayed the share market as a barometer of the performance of the government and the economy. They have stressed the need for fiscal incentives to attract foreign private portfolio investment and thereby improve the balance of payments position, and so on.
>
> Altogether, tax reform involving broad-basing of direct taxes through the removal of major exemptions and concessions has been effectively frustrated by entrenched, powerful, well-organized and articulate interest groups. The government has had to retreat in the face of opposition from such groups. It has been left with the worst possible outcome. Tax rates have come down, while the multitude of tax expenditures continues.
>
> The failure of government to broaden the base of direct taxes by reducing tax expenditures leads to the identification of a number of factors which mitigate against success of reform initiatives as follows:
>
> **i)** Lack of commitment to the reform by agents of the state, arising from a perception that the reform may damage vital national interests like food production, savings, exports, etc.
> **ii)** 'State capture' by special interest groups like the traditional feudal élite, bureaucracy and the emerging corporate business interests which extract substantial rent from the existing tax–expenditure system and are unwilling to give up their privileges.
> **iii)** Wrong strategy of implementation of reforms. By first reducing tax rates the opportunity which existed for bargaining with (and compensating) losers was lost.

Sindh was made fifty years ago, in 1968! There can be no denying the fact that there is a very strong case for immediate reassessment of the rental value of properties in urban areas.

According to a report:

> The case, therefore, for a more or less immediate reassessment of GARVs is very strong. The longer this process continues to be delayed on the grounds of political expediency or otherwise, the less will be the degree of exploitation of the revenue potential of this tax. This is of particular significance to the local governments in the country who generally get the dominant share of revenues collected. Municipal revenues have tended to be constrained by the low level of revenues from the property tax which is internationally one of the principal sources of local revenue.[36]

This particular tax, which has always had immense potential as far as revenue from provincial governments was concerned, is one of the most underdeveloped sources of revenue for the provincial governments. Moreover, since most of the revenue from this tax (85 to 95 per cent in the past) was given to the local governments at the lower tier, the underdevelopment of this tax and low effort on the part of provincial governments had a serious negative impact at the local level as well. The constraint on developing and expanding this tax on the basis of new assessments and at enhanced rates has always been political. Although the Ordinances require reassessment of property value every five

Box 10.6

Waivers and Exemptions, and the Culture of SROs

1. Khurram Hussain, shows one of the many unsavoury sides of Pakistan's taxation structure, where numerous industries, firms and individuals have been granted waivers and exemptions and do not have to pay taxes.

If you like big numbers, you'll love this. On Monday our finance minister told us all that more than Rs. 650 billion worth of tax exemptions have been granted to various entities over the last four years.

To get some perspective on the scale of that number consider this: the total amount of money that Pakistan has received from the IMF over the same time period is a little over \$5bn, which converts to less than Rs. 500bn, for now anyway.

Get it? The amount that has been given away through exemptions and waivers on taxes to a whole galaxy of domestic stakeholders is larger than the amount that Pakistan has sought as a bailout from foreign creditors over the last four years.

Quietly and rather matter of factly, our finance minister has informed us that we go around the world asking for aid in all shapes and varieties, and this is what we essentially do with the aid money when it arrives. We give it away to large stakeholders in the form of waivers and exemptions on taxes.

The math gets truly infernal. Just annualise the amount given to us by the IMF, for instance, and you get a figure of about Rs. 125bn per year as the amount we've received from the facility that began in November 2008.

And if you look at the revenue amounts waived during the same years, they average out to above Rs. 150bn each year, meaning that our own revenues are being used to cover the revenue loss from these waivers and exemptions after all aid money has been consumed.

I could cut this any number of ways and it gets worse and worse. Not only are we asking foreign creditors to help us pay for these exemptions and waivers, we're leaning on the generosity and philanthropic instincts of our friends and allies, we're invoking the blood and sacrifice of our war dead, we're parading the plight of our flood victims on the world stage to buttress our demands.

And all the while, the waivers and exemptions have continued unabated. In the year of the great flood, to take one example, while the country went to every forum in the world to ask for financial assistance in the name of the flood victims, while the government hosted a donors' conference of sorts in the comfort of the Serena Hotel in Islamabad, the total amount given away through waivers and exemptions was just over Rs. 150bn, larger than the amount of money we got in aid in the name of the floods.

There are four separate categories under which these waivers and exemptions are typically granted. The Customs Act of 1969, and the respective statutes that govern the operation of the sales tax, income tax and federal excise duties. Each statute contains specific clauses that give the power to grant exemptions.

'There are two types of waive-offs,' the finance minister's statement says. There are those which are 'claimed by the taxpayers at the time of filing tax returns' and those that are allowed by the government 'any time during the year keeping in view the economic realities'. The latter variety of exemptions are granted through what are known as a statutory regulatory order, or SRO, and other miscellaneous notifications that the tax bureaucracy is empowered to issue on its own.

And only a day after the finance minister's statement before the National Assembly, the Public Accounts Committee was informed that more than 4,500 SROs have been granted in the last four years. 'It seems the country is running on the SROs,' the committee's chairman reportedly said upon hearing this.

This power to grant waivers and exemptions is not new, nor is this the only government to have used it so widely. In fact, it's decades old, with some of the legislation dating back to 1969, and the last modifications to the statutory authority of the tax bureaucracy to grant waivers and exemptions having been made in 2001.

Every government for as far as our memory is allowed to travel has used these powers extensively to play a complex game of give and take with the country's business elite.

Sometimes this complex game of give and take has operated through minor adjustments to the administered prices, like in the case of sugar, and other times through legislation that skews the pitch in favour of one player or category of players, like in the refusal to impose a proper capital gains tax on stock brokers.

But fine-tuning of this game, this political economy of the rentier state, works through the ad hoc grants of waiver and exemptions that are often designed for the benefit of a single party.

The finance minister's statement is accompanied by a list of those entities that have availed of a waiver of customs duty larger than Rs. 1 million, and the list contains names of NGOs, lots of government departments, as well as private companies.

But the real list we need to see is the one that contains names of parties that have had amounts waived under the sales tax, where the large trade-offs are applied.

Unfortunately, the minister's statement says that such a list is 'not maintained by the FBR/field formations'.

This is the real reason behind the failure to bring about a value-added tax in this country, in spite of efforts for over a decade. VAT shuts down this power to issue SROs and grant waivers and exemptions, and as a result closes the back door through which successive governments have gamed their fortunes.

Closing down this window of opportunity, if one may play with a metaphor, is critical to placing the country on a sustainable footing, to ending our constant search for a walk-on role in a great powers war.

Source: Husain, Khurram, 'Of Waivers and Exemptions', *Dawn*, Karachi, 13 December 2012.

2. Mubarak Zeb Khan, shows how Pakistan's elite benefit from exemptions of duties.

Almost 84 per cent of tariff and duty rates have either been exempted or reduced for the benefit of certain influential lobbies and the elite in the country through notorious statutory regulatory orders (SROs) issued by the present government.

The startling revelation was made by Federal Board of Revenue Chairman Ali Arshad Hakeem at a meeting of the Senate standing committee on finance held here on Thursday. 'This is a 'financial NRO' in the form of SROs for the elite,' he said. The meeting was convened to discuss the tax amnesty bill.

When Senator Ishaq Dar of the PML-N termed the bill a 'financial NRO', the FBR chief pointed out that certain influential lobbies and the elite were already enjoying these exemptions and concessions. Defending the amnesty scheme, Mr Hakeem said exemptions in income tax, customs duties and general sales tax had created anomalies in the tax system and could be called financial NRO. 'We will approach the finance minister next week to remove these anomalies and enact a fair and equitable taxation system for all.'

He said there was a permanent window available for whitening money under section 111(4) of the Income Tax Ordinance. No questions were asked about foreign remittances, he said, adding that it provided an easy way to tax evaders for whitening black money. Mr Hakeem said there was no economic justification for concessions because favours were mostly given to friends, political cronies and powerful inefficient producers. 'We will soon work out the financial impact of these favours in duty and taxes given to influential people.'

Senator Nasreen Jalil, chairperson of the committee, put a number of questions to the FBR team and said the amnesty bill had many controversial clauses which needed clarification from the FBR. Ishaq Dar was of the opinion that the committee should reject the proposed bill in totality. After some arguments by the FBR team and suggestions, mostly from Mr Dar, the committee decided to hold another meeting, probably on 4 January for making recommendations on the bill before sending it the Senate for approval.

Noting that the bill in its existing shape could be challenged in court, Mr Dar suggested to the FBR to bring the specific amnesty scheme with the bill for approval at the next meeting. He was of the opinion that parliament could not give power to any institution to bring such schemes at the name of national interest. Senator Hamayun Khan Mandokhel also said parliament could not give blanket power to the FBR, adding that the present bill was not clear and needed further clarification. Senator Haji Adeel of the ANP asked the FBR why notices had not been issued to tax evaders.

The FBR chairman said he feared that data would be misused by tax officials who would get kickbacks from the identified tax evaders instead of collecting revenue for the government. 'The data collected by Nadra is a 'gold mine' and it needs to be used efficiently and carefully,' he said.

The FBR chairman said he still believed that tax officials would harass taxpayers, despite the fact that salary and perks of officials had been doubled over the past few years. 'We want to bring all 3.8 million people into the tax net in an honourable way,' he said.

Mr Hakeem said that 2.9 million tax evaders had been identified with the help of Nadra. Of these, 2.2 million are non-national tax number (NTN) holders and 0.7 million NTN holders, but non-filers/evaders. He said 200,000 tax evaders were rich people who did not even exist on the tax roll. 'We will issue notices to them in the next few days,' the FBR chairman said and clarified that the proposed amnesty schemes would not apply to them.

The FBR chairman said that because of capacity constraint, the remaining 2.7 million people would be given an option to come under the tax net by paying Rs. 40,000 on declaring their hidden income/assets of up to Rs. 5 million. They will have to pay Rs. 50,000 in the second month and Rs. 70,000 in the third month to avail the facility.

If the amount of undeclared income/assets/expenditures exceeds Rs. 5 million, tax rate for the declared value will be one per cent in the first month of the scheme, 1.25 per cent in the second month and 1.75 per cent in the third month. The FBR chairman said the existing taxpayers who disclosed their undeclared income/assets of up to Rs. 5 million would pay a token money of Rs. 100. No question about the source of undisclosed income/assets/expenditure would be asked, he added.

Khan, Mubarak Zeb, 'Elite got 84 pc tariff, duties exempted or reduced: FBR chief', *Dawn*, Karachi, 29 December 2012. The article has been slightly edited.

3. Shahid Kardar, writes about how SROs have destroyed Pakistan's tax culture.

THE Public Accounts Committee (PAC), and especially its chairman Nadeem Afzal Gondal and member Zahid Hamid, deserve to be applauded for taking up the issue of the notorious instrument called the SRO (Statutory Regulatory Order) and for articulating the need to end the practice of the executive issuing SROs. The latter make a complete mockery of the tax structure approved by parliament through the finance bill tabled with the budgetary proposals for the year.

Seemingly unbeknown to parliament and the public at large the government of the day can, through this notorious SRO, grant favours to friends, political cronies and powerful specific groups/lobbies of inefficient producers through concessions in income tax, customs duties and GST (general sales tax).

The Federal Board of Revenue's notifications through these SROs nullify the provisions of the finance bill approved by parliament, which under our constitution is the ultimate repository of such powers. It is indeed revealing that the cost of such tax waivers and exemptions is in excess of Rs. 150 billion a year, and then we lament that our tax-to-GDP ratio is amongst the lowest in the world!

For illustration take the case of customs duties. We find that as against the effectively traded 5,000 tariff lines there are SROs covering 84 per cent of them—impacting 45 per cent of imports and encompassing almost all sub-sectors, rendering the actual tariff different from the standard tariff.

This has resulted in the customs tariff having multiple rates, several exemptions and several conditions' requirement fulfilment, providing opportunities for the discretionary use of powers by officials, raising the cost of doing business and incentivising malpractices, corruption and misdeclaration for evading duties.

The power of the administrative apparatus to issue SROs has, therefore, provided money-making opportunities for those empowered to approve such exemptions.

These arrangements under the cover of the reprehensible practice of issuing SROs represent a cosy pact between the well-connected and the bureaucracy or the political masters in power. The abuse of such discretionary powers has enabled inefficient producers to thrive at the expense of us unfortunate, hapless consumers who pay a heavy price for keeping afloat producers who are not competitive internationally.

Their preferential treatment enables the beneficiaries to 'extract rents' and make easy money without having to make the effort to produce and market competitively a good quality product. Many a rags-to-riches story can be traced to this ubiquitous instrument, which has made large chunks of the manufacturing sector addicted to high levels of protection.

Moreover, in this way neither those favoured nor those favouring them are accountable to parliament for striking such bargains. Tragically, even the courts have, through a host of decisions, protected those benefiting from SROs. And the cost to the economy of this protection has also been huge in terms of scarce resources being tied up in the inefficient production of goods.

Investors are understandably shy of operating in an environment muddied by such concessions, which has resulted in the shifting of the goal posts in favour of the chosen few who acquire a monopolistic status or are in a position to form cartels. Consequently, the policy and supporting tax structure incentivises investments in speculative ventures rather than longer gestation projects of greater importance to the economy.

By abdicating its power and allowing the executive to arrogate to itself the power to give such dispensations not only has parliament been a party to rendering meaningless the sanctity of the federal budget and the finance bill that it has itself passed, it has been an accomplice to acts that are ultra vires to the country's constitution.

Apparently, the power of the executive flows from an old 1969 act under which it was delegated such powers by parliament. The PAC having taken the lead to change the narrative should demand that this act be repealed, to take away all such powers of the executive in the future, restoring them rightfully to parliament. This would be consistent with international best practices, the world having discontinued with such a practice.

Of course, nonsensical arguments will be made about the possible loss of revenues and the need to facilitate governments to take quick decisions in emergency situations. And that depriving the executive of such flexibility would hamper governmental operations in a rapidly changing global environment.

In this writer's view, conditions could be drafted under which prior parliamentary permission would not be required, although its approval would have to be obtained within 90 days.

As for the argument on loss of revenues it is instructive that because of these SROs that its proponents would seek to retain, approximately 2,000 tariff lines (representing 50 per cent of the SROs) are liable for import duties of less than 5.1 per cent, with almost 900 of them zero-rated! So much for the likely claims about the potential loss of revenue.

As regards SROs issued to date there should be a comprehensive review of each SRO with its retention being contingent on parliamentary ratification (through incorporation in a finance bill), otherwise there should be an action plan for its gradual phasing out.

Kardar, Shahid, 'The curse of SROs', *Dawn*, Karachi, 25 December 2012. http://www.brecorder.com/taxation/181:pakistan/1273827:sros-a-kind-of-financial-nro-fbr-chief/?date=2012-12-29

SROs a kind of financial NRO: FBR chief

The Chairman of the Federal Bureau of Revenue, stated that the SROs which abound in the country, are a carte blanche to thise who benefit, a 'financial NRO'.

Chairman Federal Board of Revenue (FBR) Ali Arshad Hakim on Friday made a courageous admission before the Senate Standing Committee on Finance. According to him, the elite class and powerful lobbies have been granted huge tax exemptions through statuary regulatory orders (SROs), 'which is also a kind of financial National Reconciliation Ordinance (NRO).'

Giving a realistic picture of tax culture in Pakistan, the FBR Chairman informed the committee that the tax laws had given massive exemptions to influential groups and powerful lobbies through SROs. Unfortunately, however, general public finds it extremely difficult to start a new business due to discriminatory tax laws. The entire tax system is like an NRO for the elite class whereas the poor people cannot start their businesses in the existing tax environment, according to him.

He said powerful sectors had obtained extraordinary tax exemptions through SROs issued from time to time, adding that a narrow tax base in the country was evident from the fact that there were 805,465 corrected numbers of taxpayers during 2011. Additional revenue and documentation measures could generate Rs. 250 billion which can raise the Tax-to-GDP ratio by one per cent and the country could increase 2–2.5 per cent Tax-to-GDP ratio with the help of system, withdrawal of unnecessary exemptions and removal of distortions in the tax system.

The FBR Chairman also said that potential taxpayers were identified through consumption and behavioural patterns, including repeated foreign travels, multiple bank accounts, heavy utilities" consumption, expensive vehicles, weapons,

credit cards, posh residences, education, profession and family patterns (vacations, children studying abroad, etc). If all persons are taxed with the help of consumption behaviour, no income can be concealed anywhere in the country, according to him.

With the help of this 'data mine', 2.9 million tax evaders were identified; 2.2 million non-NTN holders and 0.7 million NTN holders but non-filers/evaders were also identified, Hakim said. He said the FBR was now equipped with 'a goldmine of data' and its effective utilization would facilitate the generations to come. He added that his department had very clear viewpoint on the documentation of potential persons. 'This data is a goldmine and we should have to use it very carefully to avoid misuse of the data,' FBR Chairman said. Around 200,000 persons would be documented without allowing them to avail registration scheme. According to him, these persons have exceptionally high expenditures and they have not even obtained the National Tax Numbers (NTNs). They will be registered under the existing tax laws. The remaining individuals would be allowed to avail the schemes. Once these persons are in the tax net, the department can ask them to file their income tax returns next year.

He said if the data of 2.9 million tax evader was given to the tax machinery for further action, it might not achieve the desired results. In such a situation, FBR would not be able to get any tax. Therefore, his department wanted to bring these 2.9 million persons into the tax net with the help of amnesty schemes. 'The legal process is very lengthy and amnesty scheme is the only way to bring these potential persons into the tax net,' he said.

In response to a question on corruption in the tax machinery, the FBR Chairman said that as Nadra chairman he used to transfer Nadra employees to significantly reduce the incidence of corruption. 'However, you can decide what should be done in the tax machinery, he added.

About the benefits of schemes, Hakim said the implementation of schemes would deepen and broaden the tax base; lifetime value of repeat tax payments. Database value will be much higher than yearly value; database will be a great help with creation of analytics for automatic detection. Moreover, it will help document the economy; improve Tax-to-GDP ratio; cause buoyancy in national economy; increase tax base & collection. According to him, the government will lower the tax rates in coming years and encourage people to bring assets to Pakistan.

In the past, the survey of markets and shops in 2000 remained unsuccessful as it was done through force without the support of any authentic data or third party information. 'It is not possible to forcefully bring these individuals into the tax net. We cannot document persons by using force which is evident from the past experience of tax survey of 2000. However, it could be done by providing them an opportunity to voluntarily come within the documented regime,' he said. Referring to investment made in Dubai, FBR Chairman said that the biggest weighing scheme had been seen in the form of investments taken to Dubai by local residents to whiten their money.

Business Recorder, Karachi, 29 December 2012

years, there are parliamentary requirements that reassessed rental values cannot exceed 10 per cent of the previous value. This continues to lead to an under-assessment of the true property value. Even if the rates are reassessed as frequently as they are supposed to be, the market values of urban property have increased by as much as fifteen or twenty times in recent years. Thus the assessed values would only capture a very small percentage of the real market rental values.

One of the main slogans raised by General Musharraf's government after it took over in October 1999, was the repeated claim that his government had established a devolved and decentralized system of government. The irony is that while there had been some devolution and decentralization from the provincial to the local (district) government level, there had been none from the federal to the provincial level. Both these factors had significant implications for resource mobilization at the provincial level throughout the duration of his rule.

As we have shown in the earlier sections of this chapter, a large number of functions previously in the jurisdiction of provincial government had been passed on to its district governments. In addition, new functions were also added to district governments. Aisha Ghaus-Pasha and Hafiz Pasha estimated that local governments would have required approximately 40 per cent of provincial budgets (both current and development) to fulfil the expanded functions.[37] However, as we showed earlier, district governments did not have the financial capacity to provide for even a fraction of these services. The burden then fell on the provincial governments, especially when they also had to come up with Provincial Finance Commission awards.

The problem was, that while provincial governments along with district governments, were to be held responsible for providing essential services, neither and especially the latter, had sufficient resources to do so. Without effective devolution from the federal government to the provincial—which includes the devolution of responsibility, power and financial resources—it was unlikely that the devolved district government system of 2001 could work effectively.

10.4.3 Local Government Revenues[38]

The common perception in the past has been that local governments were nonentities when it came to resource generation, expenditure, or the provision of services. Provincial governments were perceived to be the main providers of benefits to the people, and it was assumed that they were also better at raising revenues. However, the surprising evidence is that local governments in the earlier system prior to Musharraf's District Governments of 2001,

Box 10.7

The Rich Pay No Tax in Pakistan

Usman Manzoor, cites data from NADRA which shows that more than two million Pakistanis, almost all of whom are rich, pay no taxes.

The latest investigation conducted by a number of government organizations establishes that there are hundreds of thousands of multi-millionaires in Pakistan who enjoy elitist lifestyle but don't bother to pay tax.

The National Database and Registration Authority (Nadra), in collaboration with various departments, has compiled data of some 2,376,523 potential tax payers who do not have any National Tax Number. Sources in Nadra claim that if these tax-dodgers are brought into the tax-net, then the government can earn revenue of over Rs. 86 billion. However, FBR expects to fetch Rs. 176 bn revenue through amnesty schemes announced by it for tax dodgers.

These potential tax-payers include frequent travellers outside the country but not having NTN number. Similarly, people who do not have any NTN number but have multiple bank account holders; owners of posh residences and expensive vehicles; heavy consumers of utility services and posses arm licenses. Non-taxpayers in best professions have also been highlighted in the Nadra data.

According to the data compiled by Nadra, there are some 1,611,153 people who frequent travel abroad but are not NTN holders. Some 584,730 individuals having multiple bank accounts do not have any NTN. Similarly 56,421 owners of residences in posh localities are dodging the tax net as they do not have any NTN. Some 19,149 Pakistanis own expensive vehicles but are not NTN holders. As many as 66,736 individuals heavily consume utility services without any NTN, 13,201 individuals have arms licenses but do not have any NTN, 25,133 citizens are in the best profession but do not pay tax.

Through data mining 2,376,523 potential tax payers have been identified who are not even listed on the NTN master index. 'There are around 1,228,440 other than the potential taxpayers who are on the master index but exist in the non-filer category'.

The FBR will be briefing the prime minister regarding the findings of potential tax payers. The sources said Nadra and FBR would also be signing an agreement 'Broadening The Tax Net' in which Nadra would be identifying tax payers while the FBR would announce taxation schemes and enforce them.

The sources said 93 million Pakistanis have CNIC and this data is being integrated with the data of immigration, passport office, FBR, banks, etc so that the tax net could be widened.

The sources said there are thousands of citizens who fall in almost every category made by Nadra to identify potential taxpayers. For instance, a frequent traveller has a residence in a posh area and the utility services consumed by him are also very high and he also has multiple bank accounts and arm licenses. 'We will count two tax-payers not one if someone is living in a rented accommodation in a posh area and his utility bills are high as the owner of the house would be dealt for having expensive accommodation while the tenant will be dealt under living an elite lifestyle and dodging the tax net', the sources added.

Sources also disclosed that Nadra might get 1 to 2 per cent share of the revenue collected through potential tax-payers identified by it.

Source: Manzoor, Usman, 'Over two million millionaires have no NTN, studies show', *The News*, Karachi, 4 October 2012.

especially in large cities, had been successful in increasing their contribution to total revenues and there had been an improvement in the revenue mobilization efforts of local governments. In the 1980s, local taxes grew by an annual rate of 18 per cent, far higher than the growth in revenues at the federal or provincial level. Moreover, in 1990/1, prior to the 1991 NFC award, local governments contributed Rs. 8.8 billion in tax receipts compared to the Rs. 6.8 billion contributed by the four provincial governments. Hence, 6.5 per cent of total tax receipts came from the lowest tier compared to 5 per cent from provincial governments. But this figure should not detract from the very serious problems faced by local governments, some of which are discussed in this section and in Chapter 12.

Much of the credit for the good fiscal effort of local councils was due to a handful of large urban local governments and some districts. There were very large variations between the levels of effort and results in resource mobilization among urban and rural, and between small and large, councils. With just one tax—octroi—accounting for more than half of the revenue of nearly all urban councils, there could have been little disagreement with the urgent need to broaden the tax base of local councils. However, after octroi was done away with in 1999, local governments were forced to become dependent on federal fiscal transfers which compensated for this loss.

One area of reform that was identified was the way local taxes were collected. The provincial tax machinery collected the property tax and the tax on the transfer of property in urban areas, and the local rate in rural areas. The justifications given for provincial collection followed by revenue sharing of municipal taxes have been discussed earlier in Section 10.1.3.

However, the problem was that the buoyancy and revenue-raising potential of, say, the property taxes, depended on the reassessment frequency and value, as discussed in the previous section, where the provincial government played the only role. Since 85 to 95 per cent of the revenue was handed over to the local councils, provincial governments had few incentives to collect higher revenues as 'the net gain to them is very small in relation to the high political costs'.[39] Hence, arguments were made in favour of decentralizing the property tax to municipal governments. It was believed that local governments ought to have more incentive to mobilize

revenues so as to diminish their complete dependence on octroi, and that people may also have been willing to pay higher taxes because they saw a closer link between payment and the provision of municipal services. The most important point, however, was that 'provincial governments have pre-empted a number of taxes which fall within the fiscal powers of local government',[40] which meant that they had encroached on the revenue-generating avenues of local governments. Taxes such as the tax on the rental value of land and property, the motor vehicle tax, the tax on professions, trades and callings, and the entertainment tax could all have been collected by local governments.

Aisha Ghaus has argued that the 'current pattern of intergovernmental fiscal relations between the provincial and local governments in the country is such that the former *is instrumental in retarding the development*, in terms of expenditure growth, of the latter. This is the case because the provincial governments substitute for local governments in the provision of some important local services.'[41] After the 18th Amendment and with local government elections to be held after the May 2013 elections, one wonders how these persistent issues will be addressed.

Interestingly, there is also evidence from an analysis of the sharing of revenues from taxes of local origin, where there are

> sizeable transfers of resources in Pakistan from local jurisdictions to higher levels of government, especially provincial. This would seem to *justify some reallocation of fiscal powers* in favour of municipal governments and/or the establishment of more elaborate revenue sharing arrangements with provincial governments. The case for this becomes even stronger if a further devolution of functions to local governments takes place in Pakistan.[42]

This argument for decentralization to local government has gained much currency.

The extensive and detailed Applied Economics Research Centre (AERC) reports on local government[43] argued for decentralization, which they believed was 'justified on both economic and political' grounds. The economic justification rests on the premise that there would be an increase in efficiency in the provision of services, 'either by cost reductions or by enhancements in the quality of service (by more effective administration)', and that if local governments are included in the provision of services, then the quality of such services is also likely to be higher.[44] The main justification for decentralization based on political grounds has always been that decentralization ought to 'induce a sense of participation at the grass roots level of people in the provision and management of basic services that are of vital importance in influencing their quality of life. This process of involvement not only creates a sense of greater control and self-reliance but also provides for a clearer articulation of local needs and preferences.'[45] The presence of elected representatives from smaller communities is said to be 'beneficial' as local representatives have greater knowledge of local problems and priorities, and are supposed to be more accessible and involved in local issues. This view is also shared by Aisha Ghaus, who argues that

> decentralization of local services along with higher flows of funds to local governments is likely to improve the overall level of provision of local services in the country. Therefore, from a pure service delivery point of view a case exists for decentralizing delivery of local services to local governments. This strengthens the traditional arguments that have been made in favour of decentralization on economic, institutional and political grounds.[46]

If the arguments for decentralized local government are so obvious, why are there no elected local governments in Pakistan when democratic (or at least, elected) governments exist at the provincial and federal level? The answer is to be found in the political economy of power, its capture, its use, and its distribution. Often simple technocratic issues, which while well-meaning and probably correct, fail precisely because they are not located in a political economy framework or context, where the relationship to power, is central. Chapter 12, examines why it is, that local governments continue to, perhaps are made to, fail under elected governments, and why they are made to work under military dictatorships.

10.5 Summary and Further Reading

10.5.1 Summary

Government expenditures arise from the revenue that government can raise through taxation, or the money that it can borrow from domestic or external sources, or the money that it can print. In this chapter, we have looked at the taxation and revenue side of government and at the overall taxation structure that exists in Pakistan. The three tiers of government—federal, provincial, and district—all raise revenue and all incur expenditures. The largest share, in both revenue and expenditure, is made by federal government. With just 1 per cent of Pakistan's population paying income tax, indirect taxes provide about three-quarters of total tax collected, with sales tax the largest single contributor. We have also discussed in detail the National Finance Awards.

This chapter has identified and discussed the problems that exist between the three tiers of government, and has shown that each higher tier of government used to trespass on the jurisdiction and functions of the lower tier. The arguments for more decentralization to the provincial and local level were also made, and the numerous problems in the structure and administration of the taxation systems were highlighted.

10.5.2 Further Reading

The main sources cited in this chapter all deserve a thorough review. A large number of reports documented by the Applied Economics Research Centre (AERC) of the University of Karachi, in particular, deserve special mention. These reports are still the most comprehensive literature on the subject. The

following reports published by the AERC are recommended for a better understanding of the taxation structure in Pakistan: *Local Government Finances and Administration in Pakistan* (in two volumes), Research Report No. 72, 1990; *Resource Mobilization and Institutional Capacity* (in seven volumes), Research Report No. 85, 1991; *Resource Mobilization by Federal Government*, Research Report No. 91, 1992; *Resource Mobilization by Provincial and Local Governments in Pakistan*, Research Report No. 93, 1992; and *Metropolitan Resource Generation Study*, Research Report No. 97, 1993.

On the taxation structure, see Pasha, Hafiz, 'Political Economy of Tax Reforms: The Pakistan Experience', *Pakistan Journal of Applied Economics*, vol. 11, nos. 1 and 2, 1995; and Pasha, Hafiz and M. Asif Iqbal, 'Taxation Reforms in Pakistan', *Pakistan Journal of Applied Economics*, vol. 10, nos. 1 and 2, 1994. In addition, because there have been numerous changes in the taxation structure in recent years, the Central Board of Revenue *Yearbooks* and the annual *Pakistan Economic Survey* should be consulted. The following World Bank publications are also useful: *Pakistan: Growth Through Adjustment*, Report No. 7118-Pak (Washington DC, 1988); and *Pakistan: Country Economic Memorandum FY93: Progress Under the Adjustment Program*, Report No. 11590-Pak (Washington DC, 1993).

For the old system of local government and for a review of its history and related issues, see the following publications by S. Akbar Zaidi: 'Effective Local Level Delivery of Human Resources: Development Related Programmes—The Case of Pakistan', mimeo (Bangkok: UNESCAP, 1991); 'A Study on Making Optional Use of Municipal Budgets to Finance Child Development (Pakistan)', mimeo (Karachi: UNICEF, 1994); 'Urban Local Government in Pakistan: Expecting Too Much From Too Little', *Economic and Political Weekly*, vol. 31, no. 44, 1996; 'Urban Local Governance in Pakistan' in Islam, Nazrul and M. M. Khan, *Urban Governance in Bangladesh and Pakistan*, Centre for Urban Studies, (Dhaka: University of Dhaka, 1997); 'Politics, Poverty, Institutions: The Case of Karachi', *Economic and Political Weekly*, vol. 32, no. 51, 1997; 'Karachi: Prospects for the Future', in Khuhro, Hameeda (ed.), *Karachi: Megacity of Our Times* (Karachi: Oxford University Press, 1997); and the papers in Zaid, S. Akbar (ed.), *The New Development Paradigm: Papers on institutions, NGOs, Gender and Local Government* (Karachi: Oxford University Press, 1999). See also Chapter 12.

There has been much research and discussion on issues which have been raised in this chapter especially on the previous District Government. Amongst some reports that are available, see: Jackie Charlton et al. *Devolved Service Delivery Study: Emerging Concerns* (Islamabad: Asian Development Bank, 2003) and Nick Manning et al. *Devolution in Pakistan—Preparing for Service Delivery Improvements* (Islamabad: World Bank, 2003). Two Important academic papers are: Ali Cheema and Shandana Khan Mohmand's, *Local Government Reforms in Pakistan: Legitimism, Centralization or a Driver for Pro-poor Change?* (Lahore: LUMS, 2003); and Ali Cheema et al. 'Decentralization in Pakistan: Context, Contents and Causes', in D. Mookherjee and P. Bardhan (eds.), *The Rise of Local Government in Developing Countries: A Comparative Perspective* (forthcoming). Papers by Aisha Ghaus-Pasha and Hafiz Pasha: 'Devolution and Fiscal Decentralization', *The Pakistan Development Review* vol. 39, no. 4, Part 2, 2000, and Z. H. Anjum, 'New Local Government System: A Step Towards Community Empowerment', *The Pakistan Development Review* vol. 40, no. 4, Part 2, 2001, were amongst the earlier papers published on the new District Government system.

Since much of this chapter focuses on the pre-18th Amendment structure and system, references which look at decentralization after the 18th Amendment are given in Chapter 13.

A small selection of references on the fiscal deficit are given in the Notes, but a more detailed reading list including recent work is provided in the next chapter.

As has been argued in this Chapter, taxation is a major issue in Pakistan, yet recent research has been insufficient, both in quality and in the number of publications. See, of various quality: Pakistan Institute of Legislative Development and Transparency (PILDAT), *Taxing the Agriculture Income in Pakistan*, PILDAT Briefing Paper No. 42 (Islamabad: PILDAT, November 2011); Haq, Ikramul and Huzaima Bukhari, *Pakistan: Enigma of Taxation—Fitting the Pieces Together* (Saarbrücken, Germany: Lambert Academic Publishing, 2011); Nasim, Anjum, *Agricultural Income Taxation: Estimation of the Revenue Potential in Punjab*, Policy Brief No. 01–12 (Lahore: Institute of Development and Economic Alternatives (IDEAS), November 2012).

Appendix 10.1

The National Finance Commission and Fiscal Federalism

Jawaid Bokhari follows the 2003/4 debates around the earlier National Finance Commission Awards. The National Finance Commission (NFC) appears to have reached a near consensus on the ratios of tax revenues in divisible pool to be shared between the federation and the provinces. The radical departure made in the Award in 2009, is elaborated in detail in Chapter 13 in Part IV of this book.

Although federal Finance Minister Shaukat Aziz has not committed himself on exact ratios, the provincial finance ministers indicated to newsmen that it would be on 50:50 basis, up from 37.5 per cent for the provinces under the 1997 NFC Award and just over 40 per cent under the existing formula.

Whereas the share of provinces in the divisible pool will increase, the two minority provinces NWFP and Balochistan will lose subventions and grants amounting to Rs. 8.5 billion set aside for them by the previous NFC Award. The agreed Rs. 20 bn subventions and grants for the new award to which the federation was to contribute Rs. 15 bn and the provinces Rs. 5 bn, the lion's share coming from the Punjab, is to be shelved. In this case, the beneficiaries would have been the three minority provinces.

Earlier, officials estimated that the proposed Rs. 20 bn subvention and grants combined with 2.5 per cent of shares in General Sales Tax, assessed at around Rs. 40 bn, would have inflated the share of the provinces in the divisible pool to 44.6 pc.

The federal government is now in a position to spare more money for the provinces in view of the enlarged fiscal space, prompted by mounting public pressures to address the problem of rising poverty and unemployment. Nation-building is primarily in provincial domain.

If the share of the provinces is raised to 50 per cent, it would be a significant step towards fiscal autonomy of the provinces. The system of patronage, a product of feudal mindset, will be replaced by the eligibility of funds based on partial recognition of rights of the federating units.

Prior to the 1990 Award, the entire fiscal deficits of the provinces were picked up by the central government, breeding fiscal indiscipline and making provinces heavily dependent on Islamabad. Later, this led to freezing of provincial expenditures. The national financial system was designed to serve the unitary military government. The 1979 and 1985 NFC awards were not notified and nor were the provinces informed about any NFC decisions. For the first time, the 1990 Award laid some stress on self-reliance to improve fiscal management. It was a small step towards fiscal federalism.

But the 1997 Award deprived the provinces of a fair share of a fast growing revenue source—sales tax. Federal taxes were included in the divisible pool and the share of provinces was cut from 80 per cent to 37.5 per cent by an interim government having no public mandate. The surcharge on petroleum that yields Rs. 50-60 bn annually was kept out of the pool which Punjab rightly wants now to be included.

The 1997 Award was a device to shore up the depleting tax revenue of the federal government, eroded by rapid reduction in customs tariff under pressure of multilateral donors. The Award also terminated the cash development loans given by the federal government to the provinces. However, it gave a strong message that each province would have to manage its own resources within the centrally defined resource distribution framework.

Given the fiscal space, there are strong chances that fiscal devolution may gain momentum under Prime Minister Zafarullah Khan Jamali who enjoys good equation with his coalition partners.

Fiscal federalism is currently very weak. There is massive imbalance between taxes collected by the provinces (20 per cent) and the federation (80 per cent) All rich revenue yielding taxes are collected by a centralized authority. And the rate and incidence of taxes are adjusted, from time to time, by Islamabad with varying impacts on different provinces.

In India, fiscal federalism has been strengthened by allowing provinces to collect sales tax while retaining it as part of the divisible pool. 50 per cent of the sales tax proceeds are transferred to the central government by the provinces, says Dr Ayub Meher. Such an arrangement can help to stabilize erratic financial flows to the provinces.

The provincial governments have failed to tax effectively incomes on agriculture which contributes about a quarter of the country's Gross Domestic Product. It could become a major source of tax revenue, if properly tapped.

The current centralized system separates the taxing and spending authority for reasons of efficiency (that is questionable) and erodes accountability of the provincial governments to tax payers and of elected representatives to the electorate.

And again to quote an official, 'the central government periodically determines on the basis of needs, both the level of fiscal transfers and the method of distribution.' It damages provincial harmony.

As an understanding between the provinces and the federation on sharing of finances under the divisible pool seems to have been largely settled, the next NFC meeting (scheduled for 5 February in Karachi but may be postponed due to a holiday), will take up the issues of inter-provincial distribution. And indications are that sharing of pool money on the population basis may be replaced by a multiple factored formula such as population, backwardness, revenue generation and area.

With subventions and grants abolished, the money saved can be apportioned on the basis of provincial backwardness.

Currently, the divisible pool is shared between the provinces of the sole criteria of population: Punjab gets 57.88, Sindh 23.28, NWFP 13.54, and Balochistan 5.30 per cent.

Conceptually though not ratio-wise, it is not unlikely that inter-province distribution of resources may begin to follow the pattern set by provincial finance commissions (PFCs) for current expenditure.

Under the PFC awards, 60 per cent of the net proceeds of the provincial pool is retained by the provinces and 40 per cent, with marginal variations, is distributed among the districts. The federation and the provinces currently share federal divisible pool on the same basis.

The pool money is given to the districts on the basis of the following formula: population 50 per cent, backwardness 17.5 per cent, tax collection 7.5 per cent and transitional transfer 25 per cent.

Under the PFC awards for development expenditure, the first 'legitimate charge' is to provide counterpart rupee to foreign aided projects. 5 per cent from the left-over amount is set aside for compensating those districts which may get less revenue through formula-driven fiscal transfers.

The remaining amount is distributed in the ration of 30:70 between provincial based schemes and district government projects. And district allocations for development are shared as follows: population 50 per cent, backwardness 30 per cent, backlog of ongoing schemes 10 per cent and equal share 10 per cent. Karachi gets two and a half times higher than any district in equal share.

Khushhal Pakistan Programmes are distributed in the ratio: population 70 per cent and backwardness 30 per cent.

The formula for distribution of resources between the provinces and districts takes care of regional backwardness within each province. Similarly, there is some realization within the NFC that the divisible pool needs to be distributed on the basis of different stages of development of each province and its specific needs in the spirit of federalism.

Yet, fiscal federalism has multi-dimensional facets and poses problems which can only be resolved step by step. One aspect is the method of fiscal transfers and controls that makes financial flows erratic and retards the pace of project execution and economic development. Limits have been set for approval of projects by provincial (up to Rs. 200 million) and districts (Rs. 20 million. Projects costing over Rs. 200 million are sanctioned by the federal government. First of all, ceilings are pretty low and need to be revised from time to time.

Secondly, the efficiency at all levels requires that the three tiers of the government should be answerable to each other. Accountability should be a two-way street to become effective. The centralized system under which lower tiers of government are responsible to a centralized authority has failed to impart efficiency and enhanced productivity.

Appendix 10.2

Constitutional Aspects of Taxing Agricultural Incomes

Huzaima Bukhari and Ikramul Haq make the case for imposing a proper agricultural income tax on Pakistan's untaxed agricultural sector.

Taxing agricultural income is the sole prerogative of provincial governments under the 1973 Constitution of Pakistan. These days confusion prevails about the laws in force for levy of income tax on agricultural income. It is strange to note that politicians, parliamentarians, TV anchors and so called experts are not clear about these laws. They keep on criticizing federal government for not levying income tax on 'agricultural income' without realizing that the fault lies with the provincial governments.

The total collection by all the four provinces under these laws was dismally low in 2009 at just Rs. 1.89 billion collected against the actual potential of Rs. 200 billion. The share of agriculture in GDP that year was about 22 per cent. The low collection proves beyond any doubt lack of will to tax the rich absentee landlords in Pakistan; their number is meagre but their clout in politics is very strong. This influential class includes the generals and other high-ranking military officers, who now own substantial state land, given to them as awards. They have emerged as a new landed aristocracy. Like barons of feudal Europe, they control our politico-economic system.

Presently, the provincial governments are not levying and collecting tax on agricultural income but charging a fixed tax on per-acre basis. The charge is usually Rs. 150 per acre from the irrigated areas and Rs. 100 per acre from non-irrigated lands. This acreage-based charge is in gross violation of the Constitution that stipulates tax on agricultural income as defined in Article 260(1). Entry 47, Part 1 of Federal Legislative List contained in the Fourth Schedule to the Constitution (it remains intact even after the 18th Amendment), empowers the federal government to levy 'Taxes on income other than agricultural income'. The expression 'agricultural income' is defined in Article 260(1) of the Constitution, which says: 'Agricultural income' means agricultural income as defined for the purpose of the law relating to income tax.'

The word 'means' signifies that this is an exhaustive definition that binds all the provincial legislatures to levy tax on 'agricultural income' as defined in the Income Tax Ordinance, 2001. However, the provinces, instead of following that definition, are levying fixed tax. Nobody has taken note of this gross violation till today. Both the federation and provinces under the Constitution are bound to follow the definition of 'agricultural income' as provided in the Income Tax Law while determining their legislative powers in terms of Article 70(4), Article 141, and Article 142 read with the Fourth Schedule to the Constitution. However, it is a matter of great concern that all the four provinces are perpetually violating the command of the supreme law of Pakistan.

Even a cursory look at laws (and amendments therein from time to time) promulgated by them, to tax 'agricultural income' shows that:

(a) Khyber Pakhtunkhwa has not even provided the definition of 'agricultural income' in its Northwest Frontier Province Agricultural Income Tax Ordinance, 1993. The tax levied under the name of 'Income Tax' is, in fact, a land tax on the basis of produce index units. This is nothing but a mockery of legislative process. If there was no political will to impose income tax on 'agricultural income', then what was the need to hoodwink the people by calling it Agricultural Income Tax? Since 1993 no government of the province has bothered to correct this anomaly. This shows the level of understanding of Constitutional provisions by our legislators (sic).

(b) The same is the case with Sindh Agricultural Income Tax Act of 1994 as amended from time to time. The PPP government is keen to collect VAT or sales tax on services, which it should as its constitutional right, but it has no desire to tax the rich pirs and waderas. Would this nation be informed how much tax is paid by Chief Minister Qaim Ali Shah, Makhdoom Amin Fahim, and many other feudal-cum-pirs of Sindh on their agricultural income?

(c) The Punjab Agricultural Income Tax of 1997, as amended from time to time, is no exception. No effort was made till 2000 to impose income tax on total income earned from this source. A face-saving device was introduced to levy yet another tax on acre basis at different rates in respect of irrigated and non-irrigated lands. Chief Minister Shahbaz Sharif has never bothered to tax rich absentee landlords of his province—many of whom dominate PML(N). Proper legislation should have been made as per Constitution to tax the Khosas, Gilanis, Quershis, Tiwanas, Sardars, Chaudharis, Maliks—just to mention a few. Such taxation could have provided room to initiate a number of meaningful welfare and job-oriented schemes for the have-nots, unlike the gimmick of sasti roti that was not restricted to the needy alone. But certainly, even the Sharifs have no intention to tax the rich and mighty feudals. They themselves have joined this class by grabbing many lucrative lands. See palatial palaces in Jati Umra, flats in Mayfair London, property in Saudi Arabia, Dubai, and elsewhere.

(d) In Balochistan, the position is no different. From 1993 to 1999, the Governor of Balochistan promulgated various Agricultural Income Tax Ordinances that were amended from time to time, following the same pattern as in the other three provinces.

The above analysis shows that none of the four provinces, while levying income tax on 'agricultural income' followed Article 260(1) of the Constitution. All the agricultural income tax laws passed by them are superficial whereas in substance no tax on 'agricultural income' has been imposed by any province, showing an attitude of contempt and apathy towards the Constitutional provisions.

None of the four provinces has levied income tax on 'agricultural income' as defined in the Constitution. The military and civil governments have consistently shown disrespect to the Constitution. This explains why constitutional democracy has failed to work in Pakistan; economic interests of landed aristocracy have primacy over the Constitutional rule whereas it should have been the other way around.

Appendix 10.3

An Agenda for Tax Reform?

Shahid Kardar, a former Governor of the State Bank, proposes a comprehensive agenda to reform Pakistan's tax system.

Pakistan has one of the lowest tax to GDP ratios and, even considering developing countries alone, it is in the bottom ranked nations in terms of the proportion of population registered as taxpayers—less than 5 per cent of household population. There is rampant tax evasion, partly with the collusion of the official machinery. Whereas 3.1 million people have the National tax Number, a mere 1.2 million filed an income tax return in 2010/11. What is even more startling is that of 47,800 companies that have NTNs, less than 16,800 filed an income tax return against 400,000 industrial electricity connections.

As admitted by FBR, there is a tax gap of 79 per cent (the difference between potential revenues under the existing system and that actually collected). Revenues can be raised through broadening of bases, improving the equity of the tax regime, incentivising documentation, checking evasion by embracing a zero-tolerance policy, checking harassment of, or collusion with, taxpayers by simplifying tax returns and making FBR a faceless bureaucracy, with interaction between taxpayers and tax officials limited through greater reliance on automated computerised systems.

The general tax reforms would include taxation of all incomes of same levels equally irrespective of source, with a swift reversal of the travesty of the recent amnesty granted to trading in shares. There is also need for legislation that will render all Benami Transactions illegal and subjecting all cabinet members, who should all be taxpayers, to detailed tax scrutiny throughout period of office, and they should all be taxpayers. The tax returns and Wealth Statements of all parliamentarians and holders of key public offices and their spouses (including Secretaries, Chief Justices, Chief of Army Staff, Governor State Bank, Auditor and Attorney Generals) should be public during period of office and one year thereafter. Finally, following good results of tax mobilisation initiatives, individual and corporate income tax rates and the GST rate could be lowered under a phased programme.

The specific reforms under different tax heads would be the following: For Income Tax: Greater dependence needs to be placed on technology and through that on the CNIC for tracking commercial transactions to identify potential tax evasion/evaders, including movements in bank accounts of large deposit holders. The FBR should periodically reconcile the property tax registers of all provincial governments, names of credit card holders and members of private clubs with those allotted National Tax

Numbers, for the system to generate notices to non-filers. All presumptive taxes should be replaced by withholding taxes (which presently contribute 60 per cent of income tax revenues). And the rates of all withholding taxes should be increased by at least two percentage points as a revenue enhancing measure, to incentivise documentation and penalise those trying to avoid capture in the tax net.

To prevent tax arbitrage by major shareholder executives the tax differential between the highest individual tax rate and the corporate income tax rate should be narrowed sharply, if not fully eliminated. For individuals there should be a Minimum Asset Tax of 2 per cent which should be allowed as a tax credit. Such a measure is being proposed for reasons of equity and for ensuring that large farmers do end up paying some tax, considering the poor success that provincial governments have had in collecting tax on their incomes. Any CNIC holder receiving remittances of more than US$50,000 a year should be required to pay a tax at 5 per cent on receipts in excess of US$50,000.

There is also a need to consider re-introducing the scheme whereby unlisted companies paying a 20 per cent higher tax than that paid n the previous year would not be subjected to any audit. Adequate safeguards should be built into the system to prevent incentive abuse by entrepreneurs closing down existing companies/businesses and starting new ones. Bills in excess of Rs. 10,000 per month of domestic and all bills of commercial consumers of electricity should be subject to a withholding tax of 10 per cent and 15 per cent respectively. Compared with 3.2 million commercial electricity connections (excluding countless illegal connections) in the country today (including retail and wholesale outlets, offices of companies, partnerships, restaurants and hotels) last year only 22,000 wholesalers and 12,000 retailers paid income tax of Rs. 6.2 billion and Rs. 1.8 billion respectively paid income tax, either directly or under the withholding tax regime. By levying a minimum flat rate of Rs. 12,000 to Rs. 25,000 on small retailers more revenue can be raised. Large, well-known, retailers would be assessed for income tax in the normal way. However, it is recommended that the withholding tax on cash withdrawals in excess of Rs. 25,000 be abolished to incentivise the entry of the Rs. 1.7 trillion currency in circulation into the banking system thereby helping lower the government's debt servicing costs.

Moreover, provincial governments should tax agricultural incomes, using lease rates in the area or the revised produce index units as proxies of taxable income from agriculture. The current exemption limits for income tax purposes should continue to apply. However, to ensure that the database in the system at the Federal level is up to date all farmers with holdings of more than 50 acres should be required to file a tax return.

To augment revenues from the under-exploited provincial property tax, 'rental values' for determining property tax liability of residential accommodation should be assessed at 1 per cent. of property 'market values' with a small tax credit for self/owner-occupied residential properties and appropriate exemption limits for small sized residential space. For commercial properties 'rental values' should be assessed at 3 per cent.

In the case of GST the proposed reforms are: the rate for sales to entities registered for GST should be 12.5 per cent while for unregistered it should be retained at the base rate of 16 per cent, the latter being the rate that is charged to the final consumer. For extending sales tax to retail trade, we need to examine the possibility of a single-stage sales tax to be levied by a provincial government based on location, shop area and nature of business.

For Customs Duties, to check abuse we need to identify items prone to dumping and under-invoicing and a system of ITPs should be introduced. As long as this list is a short one, the country will not run-foul of WTO rules and regulations. To both enhance revenues and simplify the tariff structure there is a need to consider levying a minimum rate of duty on all imports other than those protected by sovereign agreements (currently Rs. 1 trillion worth of imports are duty free). We have a highly distortionary tariff regime that levies different rates of import duties on the same material based on the consuming industry, thereby creating opportunities for 'extracting rent'. There is a need to simplify the tariff structure further by considering a system of 'one-chapter one-rate'.

Finally, to address issues related to Afghan Transit Trade, we should consider incentivising use of Pakistan Railways for transportation and employ use technology-tracker and GSP systems. We can also consider using quantitative restrictions for items prone to smuggling.

On the administration side, focus should be a) on improving the quality of FBR's data warehouse and IT systems; b) ensuring that the taxes collected by the 'withholding agents' or from the end consumer in the GST are eventually deposited in the governments' coffers; and c) on audit/tax notices being generated electronically stating in detail the reasons why the system raised the notice. And to check collusion, two tax officials should be required to sign the notice and interview the assesee.

The above should represent the minimum tax reform agenda for any new government to assume office after the forthcoming elections. It should be able to generate additional revenues of 1 per cent of GDP per annum. However, while some proposals will be politically tough to implement as they will require legislative changes or face resistance—not to mention the estimate of additional revenues each year looks ambitious in a sluggish economy—the continued postponement of fundamental revenue, expenditure, policy and institutional reforms is also no longer sustainable.

Kardar, Shahid, 'Tax Reform Agenda for Next Government', *The News*, Karachi, 28 March 2012.

Appendix 10.4

How Can Taxes Be Increased?

Sardar Irshad Shaheen, in a detailed article, discusses numerous ideas and proposals to raise Pakistan's tax to GDP ratio. This is an edited version of a longer article.

High tax rates and an overall complicated tax system in Pakistan are the main causes of the black economy and tax evasion, non-documentation and corruption. The informal sector is thriving due to unchecked illegal activities such as smuggling, black marketing, and drug trafficking that are taking place in major parts of the country to the advantage of pressure groups who are helped by powerful mafias and vested interests. They are further promoted and protected by politico-bureaucratic amalgam through erosion of institutional stability and hollow cosmetic measures.

It is a proven fact that all taxes in any shape are unwelcome, but income tax is the most unpleasant of all taxes, and it remains so in whatever from it is introduced anywhere in the world. A chief reason for its unacceptability is that it does not provide any direct return or benefit to the taxpayer.

A country's tax system can be successful only if it has:

(1) Clarity of law and communicable simplicity of procedure. (2) Stability in institution building and continuity of policies for promoting tax culture, in accordance with the stage of development of a society. (3) Specialised and professional top management equipped with practical experience in tax field. (4) Enforcement of law in letter and spirit. (5) Provision of incentives to the taxpayers with some direct social and material advantages.

Simplicity of tax law and procedure will not succeed unless the number and rate of taxes are reduced to a reasonable level. A few years back more than hundred different taxes were in operation in our country out of which the most frequently charged 77 taxes included; 20 federal taxes, 19 provisional taxes, 14 local taxes and 24 other levies and surcharges. The businessmen were entirely at the mercy of various government departments. The tax rates were also unreasonably high since it was an easy way to increase revenues by increasing the number or rate of taxes.

Simplifying tax laws through experimentation:

Legal provisions under the Income Tax Act 1922 were considered quite complex particularly due to new requirements faced by taxpayers in the emerging business environment. This act was replaced by the Income Tax Ordinance, 1979, in which legal provisions and procedures were re-arranged in a much simplified manner. It was welcomed by all the stakeholders. There was no strong demand to replace this law by a new one. The only demand of the taxpayers then was that Universal Self Assessment Scheme be given legal cover instead of changing it every year through circulars.

Nevertheless to the amazement of every stakeholder, a new law was drafted not by local experts, but by a foreign expert completely oblivious to the local conditions purely on the pattern of a developed economy. This law became operative as the Income Tax Ordinance, 2001. Even senior field officers were not taken into confidence and the entire exercise was done under the compulsion of IMF and World Bank. In the name of reforms every detail was prepared by IMF through a 'confidential' paper in which the designation, nomenclature, the design of offices and number of officers and employees were proposed by foreigners. The dominant role allowed to the World Bank and IMF made many field officers believe for quite some time that funds for reforms supplied by these institutions were grants and not loans. Not only was the road map prepared by the IMF followed literally, but the loan money had been squandered recklessly. After the promulgation of the Income Tax Ordinance, 2001, more than four hundred amendments had to be made in it during the first month alone. Over two thousand amendments have so far been made in the Income Tax Ordinance, 2001, as it was not in tune with the domestic requirements. It was an unnecessary exercise of mere experimentation which greatly eroded the institutional fabric of the tax organization and added a great deal of confusion.

After the operation of the Income Tax Ordinance, 2001, repeated concessions were allowed to taxpayers some of which were not even demanded by them. Our system of income tax today is one of the most concession-orientated systems in the world. But compliance of tax laws has shown no improvement.

In comparison, India redrafted the Income Tax Act 1922 in 1961 and income tax laws have been enacted under the Income Tax Act 1961 with effect from 13-09-1961. In this act amendments have been made through 109 finance acts so far. These amendments have been smoothly made by adding additional sections and sub sections without drafting new laws again and again. For instance in Chapter-VI A dealing with some deductions, section 80A has 67 additional sections (besides sub sections) from section 80A to 80 VVA, and section 115 has 75 additional sections from 115A to 115WL. Indian income tax rules revised in 1962 are still operative. We replaced the Income Tax Act 1922 with Income Tax Ordinance 1979, which was repealed and replaced by the Income Tax Ordinance 2001 drafted by a foreign expert based on the model of an advanced country.

The Indian tax system had the closest affinity with our business and social environment since both countries inherited the Income Tax Act, 1922. But instead of sharing common experience with Indian tax laws, we preferred aping a model of a distant advanced country having little relevance to our ground realities.

Erosion of FBR as an institution:

An imported finance minister (later prime minister) had managed to thrust upon the FBR five members from the private sector who had little working expertise in a taxation department. Huge amounts were spent on them as perks with hardly any positive achievements. All this was done in the name of reforms and introduction of fresh (but alien)

experience in this specialised organization. These members could hardly match the career tax officers having over 30 years of practical field experience. The officers and workforce remained disillusioned and no positive long lasting result could be achieved. Major attention was focused on withholding tax which has been imposed on nearly every consumable item or receipt, and income tax got converted into an indirect tax which is suicidal for the very spirit of direct tax system. Even the formulation of the budget has been artificial as major chunk of revenue came from sales tax, customs duties and withholding tax on constantly increasing imports. So when these sources fell, the budget target also fell significantly. As if this was not enough, the federal government appointed a generalist as chairman FBR last year (who was junior to 38 officers of FBR). This was done at the most crucial time, when collection of revenue was most needed during the end of last financial year and the government could ill afford such an adventure. When the career members protested at this appointment, they were sidelined. This year too, just four months before the end of the financial year, the previous head of FBR has been replaced by a new generalist officer. The appointment of a generalist as head of a technical and professional organization reflects total disregard of national interests, particularly at this critical time.

Such an attitude appears to be a deliberate attempt to erode national institutions which is a classic example of bad governance. The undeniable fact is that FBR has been failing in raising its tax-to-GDP ratio due to: (a) excessive experimentation and resultant erosion of intuitions, and (b) little importance given to career offices and tax experts in policy making and top postings.

Current state of affairs:

(1) The budget target of the FBR was fixed at Rs. 1,630 billion which was revised and re-fixed at Rs. 1,588 billion. With two months left, FBR's total collection up to April 2011 was Rs. 1,147 billion, leaving Rs. 441 billion balance to be collected. Collection of such a huge amount does not appear to be possible. The policymakers not only banked heavily on foreign borrowings but had no definite plan for the economy despite the energy crisis, slash in PSDP (twice) and substantial interest payments on foreign debt amounting to Rs. 1,300 billion, which consumed a large proportion of the national resources together with expenditure on the war on terror.

The quality of economic analysis and research of our financial experts can be found in Economic Survey 2009-10. The information and figures spread over various pages lack any descriptive scrutiny leading to no direction. As a whole the survey appears to have been prepared with no thought or effort. If such is the government's priority then one should not be surprised if the revenue system today is in such a mess.

(2) As pointed out earlier, our income tax system today is heavily concession oriented, but despite that the tax base has not expanded adequately and the tax-to-GDP ratio is still plummeting.

Taxpayers must be provided a guarantee of stability in tax rates and procedure of the system. Legal guarantee of Universal Self Assessment has been provided through statutory provisions in the Income Tax Ordinance 2001. Every return of income filed by a taxpayer is to be accepted irrespective of declared figure of income or loss. The rates of income tax were also to be reduced with some variation and the minimum rate should be half per cent and maximum twenty per cent for every taxpayer including the corporate sector. This would have reduced evasion, malpractices and corruption, resulting in expansion of the tax base. But the government fixed the rate at 35 per cent on corporate sector whereas on salary income, the maximum rate was reduced to 20 per cent. The FBR has again failed to appreciate the role of continuity and credibility of tax laws. Having failed to broaden the tax base, tax rates have been increased on all classes of income with complicated methods.

(3) The government on the advice of non-technical consultants and advisors has constantly been introducing whitening schemes, despite the fact that foreign remittances through banking channels were a constant source of whitening the untaxed money. The latest adventure by the government was that only two per cent tax was to be paid through a whitening scheme for whitening any amount of assets or black money, but the response was a paltry payment of Rs. 3.2 billion income tax for whitening assets, just 1.23 per cent of the total size of economy. This sorry state of affairs in the presence of every concession allowed by the government is most unfortunate and speaks loudly of the apathy of the policymakers. This also shows that the government would not want FBR to be an independent stable institution run by experts and experienced tax officers. Obviously the first priority of the government must be that highly experienced career officers of tax service be posted to top management levels of FBR and there should be no room for any mediocrity.

(4) Back in 1998 the number of taxpayers stood at 961,090. These taxpayers included salaried persons (411,000) and business class (534,000). After eleven years the position as on 30-06-2009 and 30-06-2010 was as shown in Table-1.

The figures in Table 1 clearly reflect the dismal performance of the policymakers. The documented sector (or corporate sector) is very small which mainly bears the brunt of tax collection. Top one hundred taxpayers paid Rs. 174 billion in 2010 besides deduction at source and advance tax (mostly paid by petroleum, banking and manufacturing sectors). Other than the active registered companies and salaried class, the number of business taxpayers is quite low. Their share in the income tax collection is less than 10 per cent of the gross collection whereas the share of a salaried person is 7 per cent. After deducting the collection of tax paid by corporate sector at Rs. 176 billion plus gross withholding tax (with CVT collection), the balance amount left is Rs. 15 billion only which is around 3 per cent of total tax collection. It is argued that the business community pays withholding tax on almost each item, but the same is true of the whole population including the large majority of poor people. The common man pays withholding tax on mobile phones and other items (including CVT), which was almost 54 per cent of the gross income tax collection in 2009. It may also be added that corporate sector, government corporations, banks and some multinational companies including oil companies, have been

paying bulk of the tax revenue. Almost the same number of companies (one hundred) paid over 80 per cent of indirect taxes. Obviously the number of regular business taxpayers who filed returns of income could not increase.

(5) Overall collection of FBR as on 30-06-09 and 30-06-10 shows an unpromising situation. (see Table-2)

The figures in Table 2 indicate that the amount of withholding income tax, sales tax on imports and federal excise on imports and customs duties works out to be 51 per cent and 63 per cent in both years, respectively. Major source of even domestic sales tax and federal excise duty comprise of:

(a) Consumption of sugar and products of edible and medicine, etc.
(b) Utility bills and excise duty on bank transaction.
(c) Purchases by government and semi-government organizations, corporations and various contracts. Add to it the withholding tax on almost every item and it would be clear that the burden of 70 per cent of all taxes is being borne by the common man through indirect imposition of taxes.

It is a matter of grave concern that the situation is deteriorating. The tax-to-GDP rate has plunged to 8.8 per cent. The number of income tax business returns received during the last two years was quite unsatisfactory.

As regards to sales tax, the situation is worse. The number of enrolled sales taxpayers is merely 102,167 and only 90,204 returns are now regularly being filed. During the financial year ending on 30.06.2010, only one hundred corporate taxpayers paid 81 per cent sales tax (Rs. 240 billion) out of a total collection of Rs. 295 billion domestic sales tax. A major amount of domestic federal excise duty was also paid by only twenty four corporate taxpayers (mostly petroleum companies).

Solution:

The past experience of over three decades leads us to the conclusion that frequent experimentation and outside interference has caused erosion of the FBR as a stable tax collecting institution, with severe repercussions for the taxpayers and officials alike. The Central Board of Revenue was re-designated as Federal Board of Revenue through an act of parliament with effect from 1 November 2007 as a semi autonomous body after years of deliberations and efforts. The newly established organization's performance was affected by mindless experimentation and appointment of non professional individuals at the helm of affairs. The FBR appears to lack direction and functions without proper coordination among various tiers of its departments. There is great deal of confusion and dissatisfaction all around.

If the government is really serious in tackling the issue of tax revenue collection, it must consider the FBR as an essential state institution. The right people for the right job must be a permanent feature with well defined career-oriented expertise in the organizational hierarchy. In areas like reforms and restructuring, the task must be left to experienced and senior officers of FBR only, who can re-examine every aspect of structural anomaly according to the actual requirements and ground realities. It must be emphasized that the FBR needs to be strengthened as an organization based on professional competence.

The following measures, therefore, need to be adopted for immediate and long-term stability and efficiency of the taxation system, which would also help to expand the tax base and increase revenue:

A - (1) FBR is traditionally plagued with political pressure and bureaucratic (vested interest) influence. The first step should be to select a chairman of FBR on merit. For this purpose, the post of chairman should be advertised for selection through Public Service Commission for a fixed tenure of four years based on academic qualification and professional experience. Such a step would go a long way in stability and efficiency of the FBR with no apprehension of political interference.

(2) Job classification with career planning must be clearly defined with strict application at all levels for postings and transfers. Job performance of various sections of FBR needs to be revamped for better coordination and only those officers should be posted in FBR who have sufficient field experience turn by turn for a fixed period.

(3) A full fledged research and development wing needs to be established to guide the FBR in the tax policy matters and suggest practical ways for effective coordination between FBR and field formations in the light of ever emerging new situations.

(4) Systems of appraisement of customs duty and Pakistan Customs Computerised Systems (PACCs) and system of sales tax processing and Sales Tax Automated Refund Repository System (STARR) should not be closed, but upgraded for application in all the dry ports and sea ports to make them transparent and less time consuming. Only fully trained and honest officers should be empowered to appraise and assess tax liabilities in accordance with best practices principle.

(5) Smuggling is perhaps the most lucrative and organized business in Pakistan and smuggled goods are sold openly everywhere particularly due to misuse of Afghan Transit Trade (ATT). Many departments including Federal Investigation Agency, commerce ministry, and foreign office deal in anti-smuggling cases. Other agencies like Coast Guards, Frontier Constabulary, Levies and even the police department have been given anti-smuggling powers. It not only creates overlapping and delay in taking proper action, but it also becomes a source of organized corruption which explains why smuggled goods are available not only in big cities but also in small towns. These agencies mostly run after tracing smuggled goods for corrupt practices and they do not focus on their own duties. A single agency fully trained and equipped must be empowered in dealing with anti-smuggling in an effective and transparent manner.

(6) All exemptions from sales and income tax should be withdrawn. The chief commissioner should be empowered to allow exemption in genuine cases for a specified period.

(7) At present only one hundred taxpayers of the corporate sector pay 90 per cent of sales tax on imported and domestic items. To make it acceptable within the business community, sales tax or RGST should be considerably reduced to 5 per cent starting from a fixed rate of 1 per cent or Rs. 100 on specified monthly sales (gradually increasing up to 5 per cent which should be adjustable). Sales tax at the rate of 1 per cent should also be imposed on defence purchases as well as on

all medicines which should be non-adjustable. International tenders should also be taxed 1 per cent non-adjustable sales tax.

(8) Federal excise duty should be merged with sales tax to reduce the number of taxes and hassle for the taxpayers. The sales tax system must not only be fully automated to minimise delays and corruption, however a strict system of audit should also be put in place to eliminate the misuse of the system.

(9) Claim of refund on account of input cost has been a major source of corruption and malpractice. This can be curbed by reducing sales tax rates and abolishing exemptions. Instead alternate incentives can be offered to exporters including exemption of income tax and other taxes/levies on exported goods.

B - (1) Tax revenue enhancing measures:
For expanding the tax base, some provisions of law need to be amended/added to ensure that:

(a) All property transactions involving plots of 2 kanals and above in the urban areas of big cities should be registered only after verification of national tax number (NTN) of seller and purchaser;

(b) Similar method should be adopted for sale and purchase of commercial property of any size in big cities;

(c) All types of vehicles with market value of one million rupees or above should be registered/transferred after verification of NTN from the tax officer;

(d) Every person travelling abroad, except students and foreign nationals should be required to obtain NTN from the income tax department. This should also include travel for Umrah, Hajj or Ziarat, medical treatment and personal visits;

(e) Expenditure on lavish functions, including marriage and social/political gatherings and conferences should be taxed either at a fixed rate or booked for assessment of income after verification of NTN of the person concerned;

(f) Services sector is highly under taxed, particularly the income of surgeons, physicians, advocates and professionals rendering consultancy services. Surgeons earn an average of Rs. 0.5 million to Rs. 20 million per month. A specialist's income ranges from Rs. 0.2 million to Rs. 1.5 million per month, whereas their annual declared income is generally even less than their monthly income. Fees of private professional colleges and schools are also very high. Their share in revenue is nominal but no meaningful audit has ever been conducted. A mechanism needs to be adopted to properly tap this very important under taxed source of revenue;

(g) For better compliance, tax returns should be prepared in Urdu together with pamphlets for proper guidance of taxpayers.

(2) Making the tax laws equitable:
(a) The most frequently raised objection by the business community in particular and public in general is that politicians are selected by the people to safeguard their rights and are supposed to make laws in the best interests of the populace. Nonetheless, our politicians violate the law themselves when it comes to paying tax. Statistics show that very few legislatures of the national, senate and provincial assemblies are on tax rolls; and those who have a NTN pay an insignificant amount compared to their lavish expenses. It should be made mandatory under the law for every person contesting in the election (at any level) to get a NTN and file their return of income and wealth statement. Any person found guilty of tax evasion must immediately be disqualified. Such a step will give substantial boost to payment of taxes as leaders of the people will become a role model for them, dispelling the public perception that they consider themselves above the law.

(b) Due to a powerful lobby of authoritative landowners, agricultural income is exempt from income tax as it is a provincial subject under the constitution. Tax exemption to such a large section of economy reflects a huge distortion and the tax laws appear as inequitable. Taxing the agriculture income will make the taxation system not only equitable but it will greatly help boost the low tax-to-GDP ratio. Three steps should be taken in this direction:

(i) Agriculture land up to 15 acres should be exempted from income tax.

(ii) Income tax rates should be reduced (even for other taxpayers) to make the tax acceptable and to reduce the tendency of evasion.

(iii) Agriculturists can be compensated by provision of cheap fertilisers, electricity and irrigation water

(c) At present the FBR has not devised a worthwhile effective procedure of audit both for income and sales tax. There is no practical deterrence against evasion of tax after introduction of Universal Self Assessment Scheme. There needs to be a transparent provision in law that each case shall be audited on its turn after every third or fourth year (unless caught earlier on account of some definite evasion).

(d) Typically traditional bureaucratic method for raising revenues is to increase the rate of tax and number of taxes, which is counter-productive as such a method encourages tax theft and makes the tax base shrink. Not only the minimum rate should start from the lowest slab, but the maximum rate of income tax should not be more than 20 per cent, as no one would willingly pay tax more than that. Instead of promoting short-term interests, the FBR must bring the tax rates to a reasonably acceptable level so that measures adopted for increasing the number of taxpayers and revenue become fruitful. Lower tax rates can be a better tool of persuasion for taxing agriculture income. Moreover, another very important advantage of lower tax rates would be that it can help in introducing sales tax even at the retail level. The traders dislike documentation due to fear of paying income tax. If they can declare maximum receipts and incomes because of lower tax rates, the resistance to the imposition of sales tax would be minimised.

(3) Wealth tax:
(a) Wealth tax was abolished in 2000 under the pressure of powerful lobbyists, comprising mostly of civil and military bureaucracy, who did not want to pay wealth tax on their properties and plots. Tax on wealth is an important instrument of a fiscal policy which endeavours to establish an equitable economic system. Due to rising trend of investment in non-productive sector like properties, it would be advisable to impose wealth tax on all immovable properties at a fixed rate to be paid at the time of purchase/transfer. Wealth tax on each property measuring 2 kanals and above should also be

charged annually. Other assets including costly vehicles can also be taxed accordingly.

(b) All the measures require the will of the government to enforce the law in letter and spirit. Successive governments have been bullied by apprehension of traders' strikes, and they have wrongly considered them their decisive political constituency. A few hundred thousand traders can never change the fate of a government or political party if it remains more sensitive to the well being of the large population of 180 million people. Moreover, the ruling elite itself sometimes proves to be biggest hurdle in the enforcement of law. A tax collector sent his officials to monitor sales of one restaurant in Lahore, which incidentally belonged to the minister of state for finance. The collector was immediately made officer on special duty (OSD) and the whole campaign resulted in a fiasco. The political leaders in general and the party in power in particular consider themselves above the law. Such a mindset would never enable us to stand on our own feet.

Table 1

S. No.	Total Number of Tax Payers	Year ending 30-06-09	Year ending 30-06-10
1	Number of companies	18973	19755
2	AOP Cases	28779	31135
3	Salaried Cases	145019	196101

Appendix 10.5

Key Issues in Pakistan's Taxation System

Maleeha Lodhi details many of the main issues in Pakistan's taxation structure which continue to keep the tax-to-GDP ratio below 9 per cent.

The prize for the most disingenuous response of 2012 must go to the group of parliamentarians who cast a report on MPs' tax-paying record as a conspiracy and chose to shoot the messenger rather than address the message.

The findings of 'Representation without Taxation' are important though unsurprising in a country where less than one per cent of people pay income tax. The study revealed that nearly 70 per cent of members of parliament did not fulfil their legal obligation to file tax returns in 2011. Eighty-eight lawmakers did not have a national tax number (NTN). More than half of the cabinet ministers did not bother to file returns. Those who paid meagre amounts inconsistent with their lifestyle included the prime minister and foreign minister.

The report showed that the national practice of tax evasion is rampant among lawmakers. Its conclusion was clear: 'The problem starts at the top. Those who make revenue policies, run the government and collect taxes have not been able to set good examples for others'.

The reaction from most parties in parliament was of indignant denial. Many castigated the report as an effort to 'defame politicians'. Others wrapped themselves in victimhood. 'Why pick on us, why not others?' said one, as if 'others' could serve as alibis for their malfeasance. This pass-the-buck stance was reinforced when the National Assembly's finance committee asked the Federal Board of Revenue to prepare a report on how much tax judges, generals and civil servants paid.

Instead of this transparent bid to obfuscate the issue, parliamentarians would have been better off welcoming a debate, admonishing tax-dodgers in their ranks, correcting any errors in the report, but above all highlighting the serious consequences that flow from the state's inability to collect taxes. The report should have urged parliamentarians to examine why the country lacks a tax culture and propose ways of addressing this to signal the importance they assign to the issue.

Pakistan's tax-to-GDP ratio of less than ten per cent is at the heart of its enduring fiscal troubles. Failure to generate domestic resources is a major factor for the country's economic stagnation and why the economy is in the critical ward today.

A decade ago, a task force established to reform the tax system held out a stark warning: 'Pakistan's fiscal crisis is deep. Taxes are insufficient for debt service and defence. If the tax-to-GDP ratio does not increase significantly Pakistan cannot be governed effectively, essential public services cannot be delivered and high inflation is inevitable. Reform of the tax administration is the single most important economic task for the government'.

This counsel has long been ignored. Availability of external financing from overseas official assistance has acted as a disincentive for reform. Bank borrowing—printing currency notes—to finance budget deficits has served as a 'substitute' for taxation but at great cost to the economy.

Mobilisation of domestic resources continues to be a story of weak political will, half-hearted reform, poor enforcement, dependence on foreign inflows and domestic borrowing, and ascendancy of powerful political and economic lobbies. Successive governments' inability to raise revenue can mostly be explained in terms of a 'privilegentsia' that refuses to tax itself and is averse to measures that can undermine its economic interests.

This has contributed to miring Pakistan in perpetual financial crises that are temporarily 'resolved' by bailouts from abroad, either as strategic payoffs for its foreign policy alignments or promises of reform, which are reneged on as soon as front-loaded tranches are received from multilateral lenders.

The sorry state of tax efforts is laid bare by the dismal statistics. Tax as a percentage of GDP has remained virtually static for decades. Hovering around 11 per cent in the 1990s, it fell to nine per cent in the last decade and has stayed there, making it among the lowest in the world.

This is not the only disconcerting indicator. The number of income taxpayers rose from an abysmal quarter of a million in 1995 to a million in 2000. By 2011 the number of people registered with tax authorities through NTNs increased to 3.1 million. But only half or 1.5 million filed returns. The number of income taxpayers actually dropped from one per cent of the population to 0.92 per cent in the past five years.

This fact is more telling when set against data from the 2011 household survey that shows the number of people earning enough to pay income tax. Only 17 per cent of 4.5 million taxable Pakistanis—one in six—are verifiable taxpayers. The rest do not pay tax.

A more fundamental issue is the large swath of the formal economy that is still untaxed. The most spectacular example of a privileged elite's refusal to pay is the absence of an agricultural income tax. Agriculture accounts for around 20 per cent of GDP and employs 40 per cent of the labour force but yields little more than one per cent of total revenue. The service sector, which now contributes the largest share to GDP—around 50 per cent—contributes just 16 per cent to revenue. Of over a million taxable retail outlets only about 160,000 are registered. Of these less than 28,000 paid tax last year.

This means that at least 70 per cent of the formal economy is untaxed, lightly taxed or non-compliant. If the informal, undocumented economy is factored in, an even larger swath of the economy is outside the tax net.

Not only is the present tax regime inelastic, it is also iniquitous, putting a heavier burden by way of indirect taxes on those least able to bear it, while offering the powerful 'legal' escape routes. The SRO regime exemplifies this. Statutory regulatory orders are administrative instruments providing ad hoc exemptions that have been used by successive governments to grant concessions to special interests, individuals and sectors. This translates into billions in lost tax revenue. Last month the finance minister told parliament that Rs. 650 billion worth of exemptions and tax waivers were given in the last four years alone. This regime fosters cronyism and negates any notion of a level playing field.

An unfair tax system is an important reason behind low revenue collection and poor compliance. Relatively high rates of tax are imposed on a narrow band of people and a few sectors. The corporate sector for example is the highest contributor (62 per cent) to direct tax revenue. But non-compliance in corporate income tax is also high at 58 per cent.

Systemic weaknesses in tax administration produce major 'leakages'. The 2001 task force found that 50 per cent of due taxes never reach the treasury, illustrating the power of the rich to thwart the law. The IMF estimates that the equivalent of $3 billion raised in revenue never makes it to the exchequer because of collusion between the influential and the tax bureaucracy.

Inability to raise enough direct taxes has led to reliance on indirect taxes, many of which are regressive. For example Pakistanis pay a greater proportion of their income as tax on petrol than any other country in the world. The major contributions to revenue are: direct taxes (39 per cent); sales tax (43 per cent); customs duty (12 per cent) and federal excise duties (6 per cent). Indirect taxes, however, are woefully inadequate to meet budgetary requirements.

To resolve its chronic fiscal crisis and generate the means for its future progress, Pakistan has to raise more revenue. Unless the present nine per cent of GDP is increased by at least 3–4 per cent, reliance on deficit financing through borrowing, with all its pernicious economic effects, cannot be ended. This is essential to reduce inflation, the cruellest 'tax' on the poor and major cause for the rise in poverty in recent years.

The key question is this: how can Pakistan chart a way out of a growing fiscal crisis, overcome economic stagnation and reverse the deterioration in public services without broadening its tax base and ensuring equity and efficiency in revenue collection? Parliamentarians ought to focus on answering this question rather than assailing those who only held up a mirror to their conduct.

11 Debt and Deficits

For many years now, the role that the fiscal deficit has played in the economy of any country—whether developing or developed—has been one of the most talked about topics around which other economic issues have revolved. Academicians, policymakers and politicians have spent written extensive and numerous papers and reports regarding the problem of public debt and of the fiscal deficit. In the western developed countries, and especially in the United States, political campaigns, including the US presidential campaign, have had the growing fiscal deficit as one of the most important issues on which candidates were expected to have a clear policy position. Some years ago, Ross Perot, the independent candidate in the elections, made the deficit his principal issue and came up with a number of somewhat extreme 'solutions' to what is considered to be the US's major 'problem', which included an amendment to the US constitution making it obligatory to balance the budget each year, which was subsequently approved by the Congress in 1995. In 2013, the US Congress and President Obama were at loggerheads around issues of taxation, spending, and the public debt, having very different and divergent views and solutions to these problems. In Europe, too, the Maastricht Treaty for European unity includes a clause that requires fiscal 'discipline' by its members. The crisis in Europe, in Greece, Spain, Italy and Ireland after 2008, and particularly in 2011 and 2012, has shown the significant role of public finance, and of debts and deficits.

The general concern is that the existing levels of budgetary deficit are abnormal and undesirable, and many OECD countries have felt the need to follow budgetary strategies that attempt to reduce, and if possible eliminate, the entire deficit as soon as possible. The general consensus seems to be that these large current deficits are not sustainable, and that unless some forceful and direct action is taken, the deficits are likely to continue growing until they swamp the entire economy.

In the case of underdeveloped countries, the importance attached to fiscal deficits is even greater. The World Bank and the IMF believe that the fiscal deficit is the single most important policy variable that affects the rest of the economy, and they are able to express this belief through the implementation of their Structural Adjustment Programmes. As Willem Buiter, a leading academician who has carried out extensive work on the fiscal deficit writes,

> the International Monetary Fund lectures finance ministers and heads of central banks . . . as follows: public sector deficits, and especially increases in public sector deficits, are bad always and everywhere, regardless of circumstances, and discretionary spending cuts and/or tax increases should be implemented to reduce these deficits always and everywhere regardless of circumstances'.[1]

In the case of Pakistan, the fiscal deficit is seen to be the cause of almost all the ills facing the economy. Shahid Hasan Khan, Special Assistant on Economic Affairs to the Prime Minister of Pakistan during the second Benazir Bhutto government, had said that 'the fiscal deficit is the primary cause of all major ills of the economy. Consequently, any effort aimed at rehabilitating the economy would have the elimination of fiscal deficit as the number one item in its agenda.'[2] Every single IMF and World Bank document on Pakistan, especially since the Structural Adjustment Programmes of 1988, says exactly the same (see Chapters 16 and 17).

Given the substantial importance of the fiscal deficit, this chapter will try to identify the issues involved. We will first highlight some of the more general and standard theoretical arguments, and then examine the claim that fiscal deficits are always bad, regardless of the consequences. This chapter will also address the issue of the fiscal deficit in Pakistan, and will analyse whether it really is the primary cause of 'all majors ills of the economy'.

11.1 Does the Fiscal Deficit Matter?

Despite, or because of, the growing awareness and concern regarding budget deficits and public debt, there is a great deal of confusion about what the implications and consequences of large and/or increasing budget deficits really are. Do government deficits absorb private savings? Does public debt diminish private demand for stocks of productive capital assets? Can the burden of current government expenditure be shifted to future generations? Are inflations caused by deficits and public debt? Will government borrowing continue to raise interest rates? And will a tax cut mean bigger deficits while it stimulates aggregate demand, employment, and output, or will it have no real consequences whatsoever? These are some of the numerous themes and questions that reappear in the debate concerning public debt, which has been singled out as causing most of the serious problems faced by the economy. As James Tobin, an economist and winner of the Nobel prize in 1978, argues: 'few issues of economic theory and fact evoke such polar disagreement. The contesting views carry radically divergent implications for public fiscal and financial policy.'[3] Willem Buiter goes even further: 'probably more uninformed

Box 11.1

Pakistan's Fiscal Responsibility Bill

1. In order to address Pakistan's high debt and deficit problem, the government in October 2003 tabled the Fiscal Responsibility and Debt Limitation Bill 2003 in Parliament.

The government on Monday introduced in the National Assembly the Fiscal Responsibility and Debt Limitation Bill 2003 to make it binding on the government to bring down revenue deficit to zero by 30 June 2008, and maintain a revenue surplus thereafter.

Briefing reporters here on Wednesday about the Bill, Finance Minister Shaukat Aziz said the economic managers of the country will be made answerable to Parliament in case of any deviation from the set targets.

Transparency about public spending and borrowings will be ensured through comprehensive public disclosures, he said.

Under the law, a target has been set to reduce public debt to 60 per cent of GDP by the year 2013 and to keep cutting it by 2.5 per cent in subsequent years. He said the government guarantees to the public-sector entities would not amount to more than 2 per cent of GDP.

The minister said few countries in the developing world had taken such an initiative to control public expenditure.

He said deviations from the targeted expenditure could only be made in case of unforeseen demands on the finances of the government resulting from either a national security situation or a national calamity as determined by the National Assembly.

However, the finance minister would have to specify the reasons to the Assembly for making such a departure.

The government would be responsible to file three statements every year to the National Assembly, namely, the medium-term budgetary statement along with a three-year rolling target, the fiscal policy statement and the debt policy statement.

In the fiscal policy statement, the government would be required to submit key macro-economic indicators like total expenditure, total revenue, total fiscal deficit, revenue deficit and total public debt.

In the debt policy statement, the government would explain the set targets concerning debt strategy and say if these had been met, and if not, for what reasons.

The government would also submit the analysis of the foreign currency exposure of Pakistan's external debt along with evaluations of the cost of external and domestic debts.

The government would also be required to inform the National Assembly about any major economic decision which it might have introduced during the year but the minister said there was no definition of the major decision.

Under section 8 of the bill which deals with disclosure of policy decisions, the finance minister would not be bound to disclose information which he felt would prejudice the substantial economic interest of Pakistan, or the security or defence of Pakistan or its international relations. Information which might compromise the federal government in a material way in negotiations, litigation or commercial activity or which may result in material loss of value to the federal government, would also be not disclosed.

Both the minister and secretary of finance would give an undertaking about the authenticity of the information and data provided to Parliament.

If the government continuously fails to meet the target of debt to GDP ratio specified for any reason for two years, the government shall take all necessary measures including the curtailment of the sums authorized to be paid and applied from and out of the federal consolidated fund to return to the debt reduction path by the end of the next two fiscal years.

He said the government would be required to establish a debt policy coordination office comprising two non-government members and a director general who would work directly under the finance minister.

Asked as to why the provision relating to cut in the salaries of related officials in case of non-compliance with the set targets had been eliminated from the bill, the minister said that loss to the national interest or objectives could not be protected through salary cuts. He, however, said that no other punishment had been envisaged in the law which could be improved in the days ahead.

2. The following is an edited excerpt from the *Fiscal Policy Statement 2010–11*, Debt Policy Coordination Office, Ministry of Finance, Islamabad, 2011, about the Fiscal Responsibility and Debt Limitation Act 2005.

The Fiscal Responsibility and Debt Limitation (FRDL) Act, 2005 was approved on 13 June 2005. The FRDL Act, 2005 requires that the federal government take measures to reduce total public debt and maintain it within prudent limits thereof. Here we identify the various limits prescribed by the FRDL Act 2005.

The FRDL Act 2005 requires the following:

(1) Reducing the revenue deficit to nil not later than the thirtieth June 2008 and thereafter maintaining a revenue surplus. (2). Ensure 'that within a period of ten financial year, beginning from the first July 2003 and ending on thirtieth June 2013, the total public debt at the end of the tenth financial year does not exceed sixty per cent of the estimated gross domestic product for that year and thereafter maintaining the total public debt below sixty per cent of gross domestic product for any given year.' (3) Ensure 'that in every financial year, beginning from the first July 2003, and ending on the thirtieth June 2013, the total public debt is reduced by no less than two and a half per cent of the estimated gross domestic product for any given year, provided that social and poverty alleviation related expenditures are not reduced below 4.5 per cent of the estimated gross domestic product for any given year and budgetary allocation to education and health, will be doubled from the existing level in terms of percentage of gross domestic product during the next ten years.' (4) Not issue 'new guarantees, including those for rupee lending, bonds, rates of return, output purchase agreements and all other claims and commitments that may be prescribed, from time to

time, for any amount exceeding two per cent of the estimated gross domestic product in any financial year: Provided that the renewal of existing guarantees shall be considered as issuing a new guarantee.'

Since the last few years, Pakistan has been faced with serious challenges both at the domestic and international fronts. The serious internal security situation, energy shortages, rehabilitation of IDPs, severe floods, and rising inflation combined with global economic and credit crises and higher commodity prices, have all put enormous pressure on the government's limited fiscal resources. Given the severity of these constraints, the government has been able to manage the fiscal deficits at reasonable levels though was unable to totally comply with some provisions of FRDL Act 2005. However, the government remains fully committed to adhere to all the provisions of FRDL Act 2005 in the future.

Source: Debt Policy Coordination Office, *Fiscal Policy Statement 2010–11* (Islamabad: Ministry of Finance, 2011), 48–50.

statements have been made on the issue of public sector debt and deficits than on any other topic in macroeconomics. Proof by repeated assertion has frequently appeared to be an acceptable substitute for the more conventional methods of proof by deduction or by induction.'[4]

Given the extensive literature that has been generated over the last decade, it is not possible in our brief review to examine all the effects and consequences of large public debt and deficits. We present only a few themes which we feel are important, and attempt to do justice to them: We examine the issue of balanced budgets and the problem of measuring the deficit itself. We then look at themes related to the effect of the deficit on future generations and on issues regarding intertemporal equity and distribution. The macroeconomic concerns of fiscal deficits—inflation, crowding out, etc.—are discussed very briefly in Section 11.1.4, and in more detail with reference to Pakistan, below.

11.1.1 Should Budgets Always be Balanced?

Possibly, the converse of public debt and deficit is no debt and no deficit, i.e. a surplus, or at least a balanced budget. The argument is that, like households and firms, governments should also live within their means and not go into indefinite and extensive debt. But as Tobin argues, 'central government is different from other economic agents. It is entrusted with the ultimate taxing and monetary powers and responsibilities of society. Its horizon spans the generations.'[5] Hence, the analogy between households and nations living beyond their means does not really hold.

Alan Blinder and Robert Solow, writing four decades ago, before public debt in the United States had accumulated to the present levels, argued that 'at the crudest level, the desire for a steady government policy translates into a plea for an annually balanced budget. . . . The belief that government deficits (but not surpluses) are somehow wrong, lingers in the mind of many politicians.'[6] At the time they wrote, balanced budgets were not in vogue, but since then, there has been a demand by politicians in the US, that an appropriate way to maintain fiscal 'discipline' without stabilizing the economy would be 'to determine the level of government spending on its own merits, independent of the requirements of stabilization policy, and to set tax rates so as to produce a balance (or a small surplus) at full employment'.[7] The demand to legislate for balanced budgets constraining government activity was approved by the US Congress in 1995.

James Tobin, arguing against the balanced budget and tax limitation amendment which were first proposed in the US in the 1980s, takes a very clear stance. His focus was on the US Senate's resolution which would force future Congresses to balance every year's federal budget, and would limit the growth of federal revenues and outlays. In no uncertain terms, he says: 'to me it seems incredibly ironic that anyone would take this proposal seriously at this time. . . . The effects on the economy would be disastrous, converting the present depression into a great depression.'[8] Similar arguments have been made in the US and in Europe after the 2008 global recession, where economists have argued that these countries need a fiscal stimulus—more spending—not fiscal restraint.

Unlike a school of thought which insists that deficits are *always* bad, Tobin argues that federal deficits may even be economically *desirable* in specific circumstances, *and what is really important is appropriate public policy*, which may or may not produce a balanced budget. However, he argues that making deficits unconstitutional would increase economic instability. It would force ill-timed expenditure cuts or tax increases, which would then make recessions much worse. 'To force Congress to decrease expenditure or increase taxes to offset cyclical deficits would further depress the economy. The deficits perform a useful function in absorbing saving that would otherwise be wasted in unemployment, excess capacity, or lower production.'[9] Tobin argues that there are built-in stabilizers in the fiscal system which give it a sense of balance, but if there were a compulsion to balance the budget every year, these stabilizers would lose their efficacy. However, *the main focus for Tobin is sensible and appropriate public policy, rather than a fixation with the balanced budget*. This view is shared by Willem Buiter, who argues that 'optimal, or merely sensible, budgetary policy is bound to be characterized by systematic, predictable, and sometimes persistent departures from budget balance. Even in long run equilibrium, zero is not a uniquely interesting figure for the budget deficit.'[10] See Box 11.1 for Pakistan's Fiscal Responsibility Bill.

11.1.2 The Problem of Measuring Deficit

While concern about the deficit and the growing public debt has invoked substantial debate, there has also been a fair amount of discussion around the measurement of the debt and the deficit, and about which items constitute government assets and/or liabilities.

Robert Eisner and P. J. Piepper argue that conventional measures of fiscal deficit and debt are 'fundamentally flawed'. In their analysis they correct the figures for debt for changes in the market value of government debt due to changes in interest rates and changes in the real value due to inflation. They find these adjustments in measurement critical to their findings: 'failure to measure deficits correctly has not only contributed to a false view of fiscal impotence, but has possibly lead to an overestimate of the importance of money'.[11]

M. J. Boskins also questions the figure quoted for the officially reported deficit, which for him is a very poor indicator of the underlying public debt policies. He feels that there are 'very significant if not overwhelming difficulties of gauging the extent of true debt policies from official reports'.[12] For Boskins, the particular view of the federal financial picture depends critically on *what one chooses to include as a measure of debt and the deficit.* By making certain assumptions and adjustments, one can end up with very different figures for the deficit and debt, and thus one can make use of them to suit one's own particular goal. Despite the apparent cynicism in the context of measuring deficit and debt, there is a built-in warning which urges one to look beyond the very obvious, and examine the data and assumptions on which claims are being made. As Buiter argues, 'none of the (doctored or undoctored) deficit measures are reliable indicators of the magnitude or even sign of the effects of fiscal policy on interest rates, capital formation, or the capital account of the balance of payments'.[13] Food for thought, indeed! See Box 11.2 for definitions of the deficit.

11.1.3 Fiscal Deficits, Intertemporal Equity, and Distribution

T. Ihori asks the important question of whether increasing debt finance is adding an increasingly unfair burden on future generations. If the answer is in the affirmative, then one may conclude that present generations are benefiting by consuming services provided currently, while future generations will have to foot the bill; hence, one should not borrow. On the other hand, one may be able to argue that, by borrowing now, there will be greater intergenerational equity,

Box 11.2

Different Budget Deficits

Different figures for the budget deficit are quoted by different people due to the different definitions in use and also because of problems of measurement. Here we show how three different figures can be generated and used, depending on expediency.

Revenue budget surplus/deficit

A revenue surplus or deficit of the budget is equal to the difference between net revenue receipts and current expenditure minus the repayment of foreign debt. Net revenue receipts are equal to the gross revenues of the federal government minus the transfer to the provinces. The revenue surplus shows the extent of public sector saving, where a surplus implies positive saving by the government, and a deficit negative saving. This revenue surplus or deficit is the bridge between the revenue and capital account of the government. In the case of Pakistan, public saving has been negative for many years, thus a revenue deficit of the budget. An increase in the revenue budget deficit shows that the government is using its borrowings increasingly to meet current expenditure, especially the salaries of government employees.

Overall budget deficit

This is the most commonly used indicator to refer to the state of a country's public finances, and measures the difference between the total expenditure of the government and its resources. It measures current expenditure plus development expenditure minus repayment of foreign debt minus net revenue receipts minus the contribution by autonomous bodies minus the amount earned by disinvestment of shares.

The primary budget deficit

Usually budget deficits measure impacts of discretionary government policy. However, one important variable of the budget, i.e. debt servicing, is non-discretionary and is predetermined by the size and terms of previous budgeting decisions and loans. The primary budget deficit, by excluding the debt service, measures the impact of all discretionary changes of the government in any year. It is calculated by subtracting the interest payments on domestic and foreign debt from the overall budget deficit.

Source: Qazi Masood Ahmed and Hafiz Pasha, 'Definition, Measurement and Implications of Different Deficits in the Budget', unpublished manuscript, n/d.

Debt or deficit?

Few people seem to know the difference between debt and deficit, and use the terms interchangeably. The deficit is the amount by which expenditures exceed tax revenues in a given period or, in the more comprehensive official jargon, 'outlays' exceed 'receipts', and hence the amount that must be borrowed or added to the debt over the period. The debt is the amount owed at any point in time—what has been borrowed and not paid back. In the case of any country which has accumulated a large debt, even a dramatic decrease in the deficit over a few years will not decrease the nominal debt—it will, in fact, increase the debt. Only if there were a budget surplus would there be some decrease in the debt.

Source: Eisner, R., 'Sense and Nonsense about Budget Deficits', *Harvard Business Review*, May–June 1993.

since part of the cost of capital outlays will be passed on to the future. He feels that the answer to the question of whether debt is passed on to future generations depends critically on the definition of the burden of debt. F. Modigliani's definition rests on the assumption that a permanent increase in government debt would crowd out private investment in the long run, causing a net decrease in the capital stock. He calls this negative effect on the capital stock a burden of the public debt—that is, 'each generation "burdens" the next one by bequeathing them a smaller aggregate stock of capital'.[14]

Even though some arguments suggest that a growing debt that must be financed by increasing interest payments is unfair to future generations, it could, in fact, be argued that future generations are better off because of the manner in which the public debt is spent. If governments invest in improving the quality of life of present and future generations by investing in social goods like health, education, and infrastructure, future generations may actually be better off in real (and human capital) terms. However, if deficits grow due to massive increases in military spending (as in the case of Pakistan, discussed below) and large tax cuts, one could argue that the burden of debt on future generations (and on the present one) may not be very fair. Thus the nature of spending public money and who actually decides where it should be spent is a critical factor often ignored in a debate that has become obsessed by the *amount* of public expenditure.

11.1.4 Macroeconomic Implications[15]

The IMF and the World Bank are agreed on one point, that dealing with budget deficits is one of the most 'vexing problems' for the majority of underdeveloped countries, and hence fiscal policy is now an essential component of adjustment programmes, where fiscal 'discipline' and 'restraint' are viewed as prerequisites for macroeconomic stabilization (see, for example, the issues in Chapters 16 and 17). Many observers argue that the fiscal deficit is a useful indicator of overall economic performance, and have found 'a significant statistical relationship between the deficit and many, though not all, macroeconomic performance variables'.[16]

The budget deficit is held responsible for high inflation, low growth, a current account deficit, and the crowding out of private investment and consumption. The relationship between deficits and other macroeconomic variables is said to depend on how the deficits are financed. Simply put, this view holds that

> money creation leads to inflation. Domestic borrowing leads to a credit squeeze—through higher interest rates or, when interest rates are fixed, through credit allocation and ever more stringent financial repression—and the crowding out of private investment and consumption. External borrowing leads to a current account deficit and appreciation of the real exchange rate and sometimes to a balance of payments crisis (if foreign resources are run down) or an external debt crisis (if debt is too high).[17]

Researchers also find 'strong evidence' from empirical studies examining the role of underdeveloped countries which supports the claims made above.

Professor Robert Eisner, a leading proponent of the minority Keynesian view regarding budget deficits, argues that budget deficits do matter and their effects can be substantial, but 'the current size of the federal deficit [in the USA] is not "our number one economic problem", if indeed it is a problem at all'.[18] He cites data from the USA 'the world's largest debtor nation'—and shows that, despite a large and growing deficit in the 1980s, inflation, thought to be one of the key victims of large budget deficits, had declined sharply. In fact, he argues, 'the time-series relation between deficits and inflation in the United States has generally been negative; bigger deficits have come with less inflation and smaller deficits with more inflation'.[19] What is more surprising, and what contradicts conventional wisdom, is the relationship between the deficit and growth: empirical evidence shows how US deficits 'have over the last several decades proved stimulatory to the economy'[20]—the greater the deficit between 1955 and 1983, the greater was the next year's increase in GNP; and the less the deficit, the less was the subsequent increase in GNP. Budget deficits are seen to be related not only to the growth of GNP as a whole, but also positively to consumption and investment. Furthermore, there is evidence that 'deficits have not crowded out investment [but] there has rather been crowding in'.[21]

For the purposes of our analysis of Pakistan's fiscal deficit, we will be concerned mainly with the macroeconomic effects of the deficits. As the arguments above show, there is some disagreement over the macroeconomic implications of a large fiscal deficit. However, almost all conventional economists, especially those who work in and advise international agencies, particularly the World Bank and the IMF, argue that the fiscal deficit is bad and unwanted. They claim that the economy will suffer appreciably if the deficit is not removed, and for them, it is probably the single most critical statistic that determines the health of the economy. Let us now examine this role in the context of Pakistan.

11.2 Critical Concerns Regarding Pakistan's Fiscal Deficit[22]

If one single factor were to be identified on which the entire Structural Adjustment Programmes from 1988 to 2013 have been based, it would have to be the fiscal deficit (see Chapters 16, and 17). The reduction of the fiscal deficit is, without doubt, the key component of the adjustment programmes, and most other measures seem to revolve around this objective.

The World Bank in its reports on Pakistan's Structural Adjustment Programmes, has consistently emphasized the importance of debt reduction.[23] For the World Bank, Pakistan's long-term growth path and the government's attempts to make development sustainable would have been severely jeopardized if the large deficits had not been reduced in the mid-1980s, when they were more than 8 per cent of

GDP. Following the first of the major adjustment programmes in 1988, the World Bank concluded that 'the implementation of the adjustment program was weakest in the area of fiscal 24 and that the high fiscal deficit would *ultimately undermine growth and inflation objectives*, and put pressure on imports, worsening the current account deficit position.

The level of domestic debt outstanding between 1980 and 2012 is shown in Table 11.1. This debt has been funded by borrowing from both external and domestic sources, with greater reliance on domestic borrowing, particularly non-bank borrowing. By relying on non-bank borrowing, Pakistan avoided the inflationary effects seen especially in Latin America. The government was able to avoid printing too much money to fund the deficit, and kept external debt 'manageable'. However, the World Bank in the past has argued that

> this borrowing strategy [i.e. non-bank borrowing] is not the most efficient, from the point of view of cost-effectiveness of debt finance and flexible monetary management. Furthermore, it has negative consequences on the development of financial markets, because of the size of the debt, its large array of instruments and interest rates, and the credit ceilings imposed on commercial banks, to avoid inflationary consequences.[25]

In the past, the government has also been held responsible for relying on the 'high-cost' non-bank borrowing source, causing an increase in interest rates and hence crowding out domestic investment. On the one hand, the World Bank compliments Pakistan for avoiding the inflationary impact of the deficit, but on the other, it castigates it for having done so.

There are essentially three types of domestic debt (see Table 11.2). Floating debt is of a *short-term* nature; it includes cash credit by commercialized banks to the government for its working capital needs and constitutes ad hoc and regular Treasury Bills held by the State Bank of Pakistan and commercialized banks. In 2002/3 it constituted 49 per cent of the debt and was 54 per cent in 2012/13. All banks were required to keep 30 per cent of their deposits in government paper (the liquid assets requirement), most of which are in the form of Treasury Bills that are available on tap. *Medium-term* borrowings constitute *unfunded* debt, which is made up of voluntary savings schemes aimed at the general public, largely comprising the National Savings Scheme instruments. This part of the government debt accounted for 23.5 per cent of total debt and has high, usually tax-free, yields. The *permanent* debt of the government is the *long-term* debt; it constitutes long-term market loans with maturities of between seven and twenty years and is usually held by institutions such as insurance companies and commercial banks. Table 11.2 shows how permanent debt first rose and then fell, with floating debt falling. Total debt as a percentage of GDP more than doubled after 1980/1 but fell again later. After the introduction of open market operations, six-month Treasury Bills constitute the largest instrument of government debt, followed by Federal Investment Bonds, both of which are usually held by banks and other financial institutions.

One of the problems identified with the reliance on non-bank borrowing to finance the debt has been that the debt's maturity structure is short term, and since much of this debt can be cashed on demand, it is very liquid. The private sector prefers these investments because of easy liquidity

and also because the tax-free rates are usually higher than the alternative saving instruments available. Moreover, the return on this form of debt is not particularly lower than for long-term debt. The problem for the government, given the liquidity and maturity structure of the national saving schemes, is that it has to take large refunding operations on a continuous basis.

> More importantly, these features make it difficult to plan precisely the refunding levels needed. Under such conditions, unforeseen circumstances, such as the recent political and economic uncertainties that led investors to accelerate the withdrawal of funds from the National Saving Schemes, can also undermine the Government's ability to manage monetary policy. In those instances, when the Government cannot cover the public's demand by issuing additional debt, the authorities may be compelled to monetize part of the debt temporarily. Such policy would require allowing monetary financing to exceed its targets for a period of time, possibly without significant consequences. But potential problems could arise if the outflows are sustained or if they are very large.[26]

The World Bank and the IMF believe that, if Pakistan is to build long-term foundations for economic development, 'the fiscal deficit must be brought down to a sustainable level. A sustainable deficit is one which permits an acceptable level of economic expansion within a framework of price stability and debt accumulation comparable with reasonable domestic and debt servicing ratios.'[27] The figure for the budget deficit which is supposed to be sustainable and which does not cause the numerous ills—inflation, low growth, current account deficits, etc.—is believed to be 4 per cent of GDP. Table 11.3, does, indeed, show how debt servicing has been eating up a substantial and growing part of the economy, while Table 11.4 shows how the fiscal deficit continues to be funded, causing domestic and foreign debt to grow, which eventually needs to be serviced. Interest payments are now the largest component of the budget announced by the government each year. Some reasons why interest payments have been rising and why Pakistan continues to live on a high debt path, and its implications, are discussed in Chapters 16 and 17. Also see Box 11.3, which links the issue of taxation with the debt and deficit.

Based on the large number of tables on the public finance structure presented in Chapter 10, and particularly those related to key variables, such as total expenditure, defence and development expenditure, interest payments, and the extent and trend of the public debt, we can summarize the main features of Pakistan's public finances and fiscal deficit as follows: These patterns have prevailed for many decades now. (Since debt and deposits arise out of taxation and expenditure readers are recommended to revisit Chapter 10 and look at the data, graphs, and trends shown there).

1. Total expenditure exceeds total revenue, and the growth in expenditure is greater than that in revenue.
2. Current expenditure alone exceeds total revenue.
3. Development expenditure has been falling, while current expenditure for the most part, has grown.
4. Defence expenditure has been very high, and much higher than even development expenditure, and although It shows signs of falling in recent years, this is due to accounting gimmickry more than anything else.
5. Interest payments along with defence expenditure constitute more than half of annual expenditure.
6. The main source for financing the fiscal deficit has been non-bank borrowing, rather than bank borrowing.
7. Domestic debt is greater than foreign debt.
8. The financing of the deficit is substantially from domestic sources rather than from foreign sources.
9. The fiscal deficit of the government of Pakistan had been around 8 per cent of GDP for much of the 1980s, fell in the 2000s under Musharraf due to the fiscal space created after ~~9/11~~—see Chapter 18—but rose again after 2007 and in 2012/13, was closer to 9 per cent of GDP.

Moreover, Table 11.5 shows some interesting trends since 1980, which are also worth highlighting.

1. Total revenue remained, with some variations over time, more or less the same for about two decades despite reforms of different sorts. However, as the economy has grown after 2002, the trend rate of total revenue has fallen.
2. Total expenditure has fallen, since 1980/1 to relatively lower levels since 1999 compared to the 1980s.

Source: Government of Pakistan, *Pakistan Economic Survey* (Islamabad: various issues).

3. Although total expenditure has fallen, current expenditure actually rose considerably in the 1990s, although has fallen significantly since 1999.
4. Since a high degree of debt was accumulated in the 1980s, debt servicing increased over time. The highest proportion ever, 8.3 per cent of GDP, was paid out in 1999/2000, although as Chapter 18 shows, Pakistan's debt problem was suddenly and significantly 'resolved' after 9/11 and the beginning of the War on Terror.
5. Defence expenditure has fallen over time, although due to changes in the composition of what constitutes defence expenditure, one needs to be cautious about making absolute claims—see Box 11.4.
6. Development expenditure has fallen very dramatically from a high of 9.3 per cent of GDP in 1980/1 to around 3 per cent in the early 2000s, despite ample fiscal space; according to the *Pakistan Economic Survey* for 2011/12, it was a mere 2.1 per cent in 2000/1 perhaps the lowest ever, although the same source shows that for 2011/12, it was probably even lower.
7. The budget deficit had been brought down to early 1980 levels, but began to rise quite dramatically after the mid-2000s.

There seems to be complete agreement amongst many Pakistani economists and contributors in the press over the claim that the federal budget deficit is the most important threat facing Pakistan's economy.[28]

Fiscal policy has been identified as a 'critical failure' in the context of Pakistan, and as one of Pakistan's key macroeconomic problems, threatening price stability, balance of payments, 'constraining essential government investment in economic and social infrastructure, and thereby, endangering growth prospects'.[29] See Appendix 11.1 for a particularly forceful presentation of this view.

The persistent reference to the 'high and unsustainable' fiscal deficit by the IMF and World Bank (and sundry other commentators)—'the fiscal deficit has been perceived as a continuing problem in Pakistan'[30]—since at least the early 1980s, when the first Structural Adjustment Programme was initiated on the recommendations of the IMF, must rest on the premise that the budget deficit is responsible for most of the macroeconomic ills in the country, and thus, needs redress. The IMF, following the conventional wisdom which it has helped frame, would, in all likelihood, hold the deficit in Pakistan responsible for some, if not all, of the following consequences: growing inflation, crowding out of private investment, a falling growth rate, and the twin of the budget deficit, the continuing deterioration of the current account deficit. We must assume that, unless it was seen as a primary cause of the problems in the economy, it would not form the central tenet of policy statements and adjustment programmes that Pakistan continuously undertakes (also see Chapters 16 and 17). Let us examine some of the evidence.

Table 11.6 presents a summary picture of Pakistan's key macroeconomic variables over a long period of time, and it is worth examining trends particularly since 1980. The budget deficit as a percentage of GDP is presented alongside

Box 11.3

Taxation and the Fiscal Deficit

M. Sharif shows how problems in Pakistan's taxation lead to problems of expenditure choices and the fiscal deficit.

The most crucial issues pertaining to giving a boost to the country's tax revenue collection is making the overall tax regime equitable, reducing dependence on indirect taxation, and increasing direct taxation. The national leadership and the FBR have uphill task in addressing these issues in the next budget as the repercussions of not executing tax reforms would be severe for the country and its citizens.

There is a widespread consensus among stakeholders that all incomes including agriculture, big businesses, and real estate ought to be taxed in making the tax system more equitable and fair. According to the central bank, during the last fiscal year the agriculture sector generated Rs. 3.016 trillion, slightly lower than the amount generated by industrial sector. The latter contributes around 18.0 per cent in tax revenue through different layers of taxation whereas contribution of the agriculture sector is hardly 1 per cent. Similarly, according to FBR estimates there are 2.3 million potential taxpayers with a taxable income. Out of these, 0.7 million people fall in the higher income bracket but do not possess a national tax number. FBR officials also complain that the commercial banks do not cooperate with them to detect concealed incomes with the result that out of 30 million account holders, there are only 2.9 registered income taxpayers. All these hitches will have to be sorted out in case the government is serious about increasing tax revenue and tax-to-GDP ratio.

The second central matter with respect to fiscal reforms is of reducing the uncontrollable fiscal deficit. The existing strategy of reducing the deficit by making substantial cuts in public development expenditure, burdening power and oil sectors with taxes, pursuing a tight monetary policy, and opting for indiscrete bank borrowing have culminated in slow economic growth. A more practical option to trim down the deficit would be to cut down the subsidies provided to unproductive state-owned enterprises that equals to Rs. 350 billion per year, eradicate corruption within the tax administration that costs the public exchequer around Rs. 700 billion annually and reduce the cabinet's expenditure that is Rs. 100 billion a year. The ruling elite has no choice but to implement strict austerity measures and demonstrate strong financial discipline if reducing the surging fiscal deficit is on its economic agenda. Otherwise the country will have to rely upon foreign assistance to bridge the huge fiscal gap that prevails in the country.

In the last three budgets, the government could hardly formulate a viable growth strategy because of its pre-occupation with the SBA programme. The end result was that the economy ended up with a deplorable growth rate, heightened fiscal deficit and rampant inflation. The ground reality hardly matches the objectives laid down at the initiation of the SBA programme. The present situation clearly reflects that a sustainable growth strategy cannot be pursued unless pivotal financial reforms are put in place that should focus on enhancing tax revenue and cutting

Sharif, M. 'Fiscal Policy Reforms and Growth Strategy', *The News*, Karachi, 9 May 2012.

other variables which it is supposed to affect. Let us consider growth. The 'very high', 'escalating' budget deficit, according to the IMF theory of causality, should have had severe repercussions on the growth of the economy. This has clearly not always been the case. Pakistan has experienced very high growth rates compared to other developing countries and averaged well over 6.5 per cent per annum in the 1980s. This is no mean achievement given the huge budget deficit, which has averaged 7 per cent in the same period. Surely, the numbers must give pause for thought.

The inflation rate is another key variable that should have exploded given the high budget deficit. An average of only 7 per cent inflation over a decade is quite creditable. Moreover, only 9 of the 26 years between 1980 and 2006 have seen double-digit inflation, with a maximum of 13.9 per cent. According to estimates, Pakistan's inflation rate should

Exactly How Large is the Defence Budget?

Sakib Sherani examines the size of the defence budget announced in the 2012–13 budget in June 2012, showing that that the figure which is announced, usually under-reports the actual size of the defence budget, by a considerable margin.

One of the most scrutinized and commented upon items in the budget is the allocation for defence spending. Depending on the ideological leanings of those doing the commentary, the number is either 'too high' or 'too low'. The more dominant narrative, however, has been that the budgetary allocations for the defence sector leave little fiscal or policy space for civilian governments by 'crowding out' much-needed spending on the social sectors. It is an important issue that needs an unbiased examination.

While the budgetary allocations for 'defence' have been made far more transparent in the past few years than ever before, with an unprecedented break-up between personnel-related expenses and operating expenses etc.—which is not available in the case of many countries, including regional ones—the complete allocation still remains shrouded in mystery. This is so because, not unlike the global 'best practice', defence spending is spread over a number of different heads in the budget—with parliament and the media usually focusing on the largest item, 'defence affairs and services'.

The other expenditure heads contain relatively smaller, but not insignificant, amounts and include, for example, allocations for payment of 'legacy expenditures' incurred for upgradation of conventional capability, or to finance military operations in the northwest, or a non-civilian component of the public-sector development programme (PSDP). Another example of an item related to the defence budget but subsumed under a different head is 'debt servicing' of military loans (amounting to Rs. 4bn in 2010–11).

All told, I estimate this year's budgetary allocation for the defence sector to be around Rs. 800 bn, or approximately 28 per cent of the total budgeted expenditure. This figure includes military pensions, but excludes other security-related spending that falls under 'civilian' armed forces' (such as Rangers and the police). It is important to emphasize that this is an approximation since I have used a past estimate of the non-civilian component of the PSDP. On its own, the non-civilian component of the PSDP is not a very large item, accounting for under 10 per cent of the total allocation, with projects in the nature of construction of barracks, or building schools in cantonments etc. An important caveat is that the figure arrived at is the gross allocation for defence-related spending. For the past several years, sizeable inflows have occurred under 'defence receipts' (mostly relating to inflows under the Coalition Support Fund), which have provided an important offset to the recourse to budgetary resources by the armed forces. These payments are provided as reimbursements for expenditures already incurred by the armed forces for deployment and operations in the northwest.

Hence, on a net basis, after netting off gross expenditure with receipts, the total estimated allocation for the defence sector in the 2012–13 budget amounts to Rs. 679 bn. This is equivalent to 21 per cent of the total budget outlay, or 2.9 per cent of projected GDP. Most discussion of defence spending is restricted to the issue of the size of the expenditure outlay. An important question that needs to be examined in any balanced discussion is: what are the implications for the wider economy (the externalities) of expenditure of this quantum?

While I have not done such an analysis, one can list the possible areas of spill over. These would include direct and indirect stable employment for a significantly large pool of people and its associated spending effects (with the value of this factor increasing in times of severe economic uncertainty), income support to over a million families via pensions and the multiplier effect of substantial spending on civil works and other infrastructure, especially in remote areas where much of this activity occurs. On the flip side, if defence expenditure is displacing resources from spending on development, the trade-off for society needs to be worked out. A critical factor in any such exercise is determination of the 'optimum' level of defence spending for a country facing multiple security as well as developmental challenges. This is where broader issues related to defence spending come in, beyond the size of the defence budget.

These broader issues relate to transparency of spending by the defence sector, its accountability, and civil-military shared oversight. A related—and thorny—issue is determination of the 'threat perception' that generates the armed forces procurement plans. Currently, these areas are the sole prerogative of the security establishment in Pakistan. On all these issues, far more progress has to be made to optimise the defence sector budget, and to reduce the significant waste and corruption that occurs in the procurement process—from purchase of ordinary everyday supplies, to land for real-estate development, to the procurement of expensive weapons systems and platforms.

The submission of the defence budget with greater details to the parliamentary standing committees, and a threadbare in camera discussion, will be an important starting point. Equally important, two other steps need to be taken: (1) the application of PPRA (public-sector procurement) rules on any substantive procurement by the defence sector; and (2) the extension of the jurisdiction of the auditor general of Pakistan to entities such as the Frontier Works Organization and National Logistics Cell, for starters.

Finally, another issue involving the armed forces relates to economic governance. There are at least two areas of the economy where the military has direct stakes and can play a more positive role: ensuring that real estate is brought more effectively into the tax net (something it has resisted in the past on account of being one of the larger developers in the country), and ensuring that smuggling across the border with Afghanistan, where personnel of the armed forces are deployed and which has damaged the economy very substantially, is drastically contained.

In conclusion, the defence budget is not as large as it is purported to be, in net terms. In addition, it has certain important externalities (positive spill-overs) into the wider economy. Nonetheless, it suffers from a lack of parliamentary debate, transparency, accountability and civilian oversight.

have averaged in excess of 50 per cent, given the high and unsustainable budget deficit.[31] With Latin American deficits, Pakistan has continued to have South Asian rates of inflation. Interestingly, however, in the early 1990s when the budget deficit was 8.7 per cent, after which it fell, inflation actually *rose* in this period. It seems that there might even be an inverse relationship between the two, at least in the case of Pakistan. Moreover, the persistent rise in inflation to double-digits after 2007/8, is not attributable to the fiscal deficit, which was actually quite low, but due to rising international oil and food prices, as well as to a devaluation of the Pakistani rupee. Mismanagement of the economy, in the interim set-up at the end of 2007 up to March 2008, and then the way the People's Party government mismanaged and bungled economic policy all the way from 2008 to 2013, was also responsible. However, importantly, there seems to be no evidence which links Pakistan's fiscal deficit with its inflation rate.

The crowding-out phenomenon is a key favourite of orthodoxy and neoclassicists, given their penchant for the private sector. The theory suggests that the government, in its financing of the deficit, would have pushed up interest rates to such an extent that the private sector would have found it unaffordable to invest, and thus would have been crowded out. This would have implied a growth rate of far less than the hugely impressive 15 per cent per annum experienced by the private sector in the 1980s. Moreover, with the even greater 'burgeoning of the budget deficit' in 1990/1 (8.7 per cent), 1991/2 (7.5), and 1992/3 (7.9), one would not have expected the 19, 30, and 13 per cent growth in the private sector over the same years. Clearly, there seems to be little truth in the claim that the private sector has been crowded out due to government policies or the budget deficit. The evidence, no matter how superficial, points to different conclusions. Moreover, in the period since 1988 when the deficit has been particularly high, so much so that the Structural Adjustment Programme of 1988 emphasized the need to cut the deficit drastically—and has continued to do so after the 2008 IMF Agreement—the economy has behaved even more unconventionally with respect to IMF theory: real per capita GDP rose by 10.4 per cent between 1988 and 1992; merchandise exports expanded by an average of 14 per cent per annum in volume; private sector gross fixed capital formation gradually expanded from 7.7 to 9.4 per cent of GDP; and even domestic savings rose from 10.5 to 12.2 per cent[32] (see Chapter 7 for why growth was so high in this period). Furthermore, even the current account deficit behaved quite contrary

to IMF theory. In the later 2000s, especially after 2007/8, it was the consequences of the War on Terror, the militancy in Pakistan, the transition from a military dictatorship to democratic rule, as well as the international crises and price rises, which caused Pakistan's economy to come undone—see Chapter 18. It was not the fiscal deficit which was responsible for these problems. With this evidence, one is forced to re-examine the questions: does the budget deficit matter in the context of Pakistan and how does the IMF/World Bank feel about this issue?[33]

11.2.1 The IMF/World Bank View of Pakistan's Fiscal Deficit, 1980–97

Given its repeated concern over the issue of the budget deficit, one is led to believe that the IMF has views on Pakistan's budget deficit consistent with its theoretical construct. Not so. The IMF/World Bank admit that

> the macro consequences of fiscal deficits in Pakistan have apparently been quite dissimilar from those in other developing countries with fiscal deficits of comparable magnitude. *Specifically, Pakistan has experienced neither hyperinflation nor debt rescheduling. . . . Growth has remained quite strong through the last two decades, inflation has not been high, and the current account deficit has averaged about 2 per cent of GNP, remaining largely financeable and not posing debt servicing problems for the country.*[34]

These institutions, despite their insistence on the need to lower the deficit, admit that the deficits have been 'quite benign' and that, despite the presence of fiscal deficits 'that are *very high* by international standards, the country's macroeconomic performance has been relatively good. . . . *There is no evidence in Pakistan of the chronic acute macroeconomic crises*—manifest in extended periods of negative per capita income growth, hyperinflation, and inability to service external debt—that have characterized many other developing countries with comparable fiscal performance.'[35]

The institutions that insist on cutting down the deficit admit that 'inflation performance in Pakistan appears to have been remarkably good. . . . At the same time economic growth has been robust',[36] and real GNP per capita between 1972 and 1987 has shown a cumulative increase of more than 60 per cent. Additionally, even the crowding-out argument seems to have been rejected, albeit reluctantly, with the IMF/World Bank admitting that public and private investment seem to be positively correlated and 'the infrastructural build up that results from government investment appears to facilitate private investment'.[37] Public investment was reduced drastically after 1996/7 as a consequence of privatization and with restraints on government spending, while private investment turned negative after the 1998 nuclear tests—see also Chapter 18.

A study conducted by the IMF on determinants of private investment in Pakistan argued that aggregate government investment had a significant positive impact on private investment, implying 'that the crowding-out effect was not strong enough to balance the crowding-in effect in the period covered [1972–88] and is consistent with the view, inter alia, as to the importance of upgrading the country's roads and transportation networks, and improving the drainage system'.[38] This government investment in infrastructure was 'estimated to be *the most important positive determinant*' of private investment in the period covered. The investment in infrastructure is expected to continue to have a '*significant* crowding-in effect' in the future. Interestingly, similar conclusions have been reached for India as well, based on an evaluation of past trends. Significantly, after 1996/7 when public sector investment was cut drastically, private investment also fell, accentuated by the consequences of the nuclear tests. As Chapter 8 shows, since public sector investment has fallen sharply over the last decade, so too has private sector investment.

The IMF believes that the deficit has not behaved in Pakistan as it should have in this period, for several reasons:

1. There was a very high rate of growth of real output (6 per cent per annum) which permitted a fairly rapid expansion of both interest-bearing and non-interest-bearing debt without recourse to inflationary finance.
2. The equilibrium deficit was quite high—5.5 per cent of GNP—despite a low inflation rate because of a very high underlying rate of growth of real output.
3. The government of Pakistan was able to borrow, both domestically and externally, at rates below the marginal cost of funds in the international private capital markets.[39]

In addition, throughout the 1980s, the budget deficit was not monetized, and external funds and non-bank borrowing were the main sources of funds to finance the deficit, so inflation remained low. It was only after 1990/1, when bank borrowing contributed a very large share of the financing of the budget deficit, that inflationary pressures emerged. However, after 1993/4 bank borrowing returned to the low, pre-1990 level.

Our own observations regarding the impact of the budget deficit on key macroeconomic variables question the economic orthodoxy with respect to Pakistan, as do the observations and findings of IMF staff and IMF-sponsored studies. While the monetarist neoclassical assumptions and predictions regarding the behaviour of the budget deficit are clearly spurious, if not outrightly rejected, the Keynesian interpretations, where public spending causes an increase in aggregate demand and, subsequently, growth, given the less than full capacity of the economy, seem somewhat closer to reality. The greater the public expenditure, the greater the rate of growth of GDP and the greater the private investment. Moreover, since there is no crowding out through the mechanism of the interest rate as predicted by theory, one is led to believe that there are ample loanable funds available at a given interest rate. Easterly and Schmidt-Hebbel, in their review of developing countries, found that private investment does not respond much to interest rates.[40] As has been argued extensively elsewhere,[41] the evidence suggests that Pakistan's economy had been in far better shape for the duration of the Structural Adjustment Programmes than the IMF/World Bank believed. Whether this was due to the huge underreported informal economy or to any other factor

is open to debate. In fact, it is interesting to note that, if indeed it is true that Pakistan's GDP is under-reported by as much as 40 per cent,[42] then the size of the budget deficit as a percentage of the true GDP would be much less than the reported official figure of 8 per cent and the present figure may even be 'sustainable'. Although this is a debatable and controversial point, it may nevertheless be the key in answering the question of why the deficit has, continued to remain 'benign', and did disrupt the positive trends in the economy as it should have. Given the nature and robustness of the economy, a fact conceded even by the IMF, it seems quite clear that, in the conventional orthodox framework, *the budget deficit may not be the real culprit after all.*

11.2.2 Re-examining Critical Concerns

Having just argued that the budget deficit, in the conventional orthodox neoclassical framework, does not matter with regard to Pakistan, we will now argue that it is perhaps the most important statistic around which debate *ought* to take place. However, we take this view for very different reasons from the IMF and World Bank.

The obsession that policymakers in Pakistan have with the budget deficit detracts attention from the really important issues. The focus should not be on asking the question: how high is the budget deficit, and is it sustainable? The real concern regarding the deficit is the issue of *spending and redistribution*. It is more important to ask the questions: What use is being made of public money? Who is funding government expenditure, i.e. who is being taxed? How is public expenditure managed? And so on.

Tables 11.5 and 11.6 again provide a very brief overview of what we feel is the central issue regarding the budget deficit: The contrast in the patterns of defence expenditure and development expenditure is the key concern regarding the budget deficit and public spending. In fact, Pakistan might well be the only underdeveloped country where defence spending has outweighed development expenditure. Since 1980, development expenditure has fallen far sharply than the small reduction in defence expenditure. Moreover, between 1985–1995, defence spending increased by 150 per cent, compared to an 89 per cent increase in development expenditure. Ironically, prior to 1985–6 when there was a military government in power and Pakistan was under martial law for most of the time, defence expenditure was considerably lower than development expenditure. After the advent of democracy in Pakistan, between 1988–1999 defence spending was higher than development expenditure in every single year, except one! There are two possible explanations for this pattern: according to one view, during military rule, not only was the military making direct use of the defence budget, but also, due to its status as 'the government' and due to various privileges, it acquired a large share in the civilian side of the economy. Thus, in real terms, defence expenditure was just a fraction of the extent to which the military really benefited.[43] This also explains why the primary budget deficit was higher in the 1980–6 period (averaging 3.6 per cent) than in the 1986–93 period when it averaged 1.9 per cent.

A second explanation for this trend is that in the post-martial law period, while the military was not *in government*, there is little disagreement that the military continued to be *in power*. Furthermore, given democracy's inability to deal with political problems in Pakistan, the military played a more overt policing role. Therefore, a high share is given to defence expenditure—and a smaller residual share to development—under democracy.[44]

If the budget deficit is 'the number one problem of Pakistan's economy', as most observers believe, it is for reasons connected with the role and distribution of public expenditure, and is not dependent on the fetish of an abstract, arbitrary, badly calculated statistic. The question of governance, or how public money is utilized, allocated, managed, and siphoned off, is of critical importance. With corruption rampant at all levels of government, and with political power being bought and sold in different provincial and national governments in the past, it is clear that the taxpayer's money continues to be used to buy off opposition and keep dissent under control. Unquestionably, the specific context of fiscal policy and budgetary deficits is all important (see also Box 11.5 and Appendix 11.2).

11.3 The Domestic and Foreign Debt Crises

General Pervez Musharraf set up a Debt Reduction and Management Committee in January 2000, to tackle Pakistan's serious problem of external and internal debt, which had grown to a size greater than that of the GDP. Unlike many other countries which had either a foreign debt problem or a domestic one, Pakistan was in that category which faced a serious crisis on both fronts, domestic and foreign. As a consequence, the Committee released a report called the Debt Reduction and Management Strategy[45] (DRMS), which laid down the causes for the excessive debt and numerous possibilities and solutions to alleviating that debt. During 1999–2000, after the nuclear tests of May 1998 and following the military coup, Pakistan was besieged with a far greater proportion of problems than what we had become used to in the past—see also Chapter 18 for the background of events leading up to these problems. For much of the decade of the 2000s it seemed that at least the external debt crisis had been resolved partially after an unprecedented debt rescheduling package—see Chapter 18. And since pressure had been lifted off the external debt situation, this should have allowed great deal of fiscal space to address issues of domestic debt as well. For quite exceptional, extraneous, reasons not related to Pakistan's Debt Reduction and Management Strategy, considerable pressure had indeed been lifted off the debt crisis. This section of this chapter, examines the extent and reasons for Pakistan's extraordinary debt profile prior to the debt rescheduling that took place.[46]

Writing in 2001 when no one could have imagined that in a few months time Pakistan's debt profile would change drastically on account of its foreign debt being rescheduled, the DRMS stated: 'Pakistan's public debt has

Box 11.5
Fixing Targets for the Budget Deficit

In this excerpt, we examine whether having a fixed target for the budget deficit for Pakistan is a wise policy move or not.

If the government's deficit is used for stepping up public capital formation, then not only does it stimulate the economy from the demand side, but also it keeps relaxing the economy from the supply side, both through its direct effect on the magnitude of capital stock and through its indirect effect via stimulating private investment. On the other hand, if the increase in the government's deficit is confined to non-capital expenditure then revival of the economy would necessarily be brief and evanescent, since such a revival would fairly soon run into an inflationary barrier.

This consideration is particularly important for an economy where agriculture accounts for a major part of the consumer goods sector. It may, for instance, be argued that *any* government expenditure (even non-capital expenditure), by stimulating the economy, would call forth private investment via accelerator effects, so that the inflationary barrier would keep getting pushed back: this argument, however, would certainly not hold in the case of agriculture. Private investment in agriculture is not governed by any version of the acceleration (or capacity utilization or even profit) principle. It depends essentially upon the availability of complementary inputs like supra-individual irrigation facilities, power, extension facilities, seed-fertilizer packages, etc. whose provision is contingent upon public investment effort. In short, in an India-type economy it is not just any expansion in the government's deficit which can trigger off a sustained boom, but an expansion that takes the form of a larger investment effort. And this is precisely what the last two years' deficit expansion has not been used for.

It seems that Budget '96 is going to revolve around one single figure—4 per cent. All indications about the deliberations underway at different levels of government in the build-up to the new budget suggest that Islamabad is going to do its utmost to bring the deficit down to 4 per cent of GDP. One of the key indicators which the government has specifically tried to control, the budget deficit, seems to have grown in importance over the last few years. In the coming financial year 1996/7, it will probably become the government's obsession, having extensive ramifications on a number of areas of the economy.

As far as raising revenue is concerned, despite the numerous tax measures taken each year to increase overall revenue—essentially by imposing a heavier burden on those who already pay taxes—in real terms very little has been achieved in the form of additional revenue. Moreover, there is growing resentment amongst those who currently pay taxes, for they believe that the tax system is riddled with glaring inequities with a large and wealthy section of society remaining exempt. Add to that the fact that for each increase in the tax rate and in tax collection, the quantity and quality of public services—from law and order to education and health—has deteriorated sharply. With additional taxes worth 25–30 billion expected in the next budget, with agricultural incomes still exempt, each taxpayer does indeed have the right to complain and question the government's logic of trying to raise more revenue to cut the budget deficit so that it could get yet another IMF loan.

One obvious way to raise additional revenue, and thereby cut the deficit, would be to tax agricultural income. But for purely political reasons, the present government is loath to tax its ally, the wealthy agricultural lobby. And herein lies the dilemma. The agriculturists cannot be taxed, but to remain in the good books of the IMF the budget deficit has to be cut. The government's solution: additional taxes on those who have no option but to pay, and fewer government schools and hospitals. In essence then, what the IMF loans do is that they allow the wealthy—whether rural or urban—to continue with their lifestyles without having to pay the consequences of living well beyond their private as well as collective means. As such, the continued access to and availability of IMF and World Bank loans has become an excuse to postpone structural reforms, such as land reforms and levying agricultural income tax.

By propping up regimes which do not have the ability or inclination to take sensitive or tough decisions, organizations such as the World Bank and the IMF ensure their longevity. By lowering the budget deficit to 4 per cent of GDP, as per IMF instructions for the coming year, the present government in Islamabad can be assured of another large IMF loan, and at the same time will ensure its survival by not disturbing the powerful agricultural lobby. For this government at least, 4 per cent is indeed sacrosanct.

reached alarming proportions. The downward rigidity of budgetary expenditures and lack of buoyancy in revenues have generated persistently large fiscal deficits over the last two decades. This has resulted in the accumulation of public debt at a fast rate. . . . There are no quick fix remedies to the debt problem. Pakistan will have to live with macroeconomic consequences of a heavy debt burden for several years'.[47] The Report argued that Pakistan's twin debt burden—domestic as well as external—is 'well beyond sustainable limits'. The reasons for this high debt were summarized as follows:

> (a) large and persistent fiscal and current account balance of deficits; (b) imprudent use of borrowed resources, such as wasteful government spending, resort to borrowing for non-development expenditures, undertaking of low economic priority development projects, and poor implementation of foreign-aided projects; (c) weakening debt carrying capacity in terms of stagnant or declining real government revenues and exports, and (d) rising real cost of government borrowing, both domestic and foreign.[48]

In the understanding of the DRMS, the debt crisis was 'essentially triggered by the un-sustainability of the level of current account balance of payments deficits and the pattern of their financing in the 1990s'.[49] The Report argued that it was this current account problem which caused both types of debts to accumulate, yet argued correctly, that there is a need to examine the issue of both domestic and foreign debt separately, since they have a different nature and impact on the economy.

Table 11.7 gives key data for Pakistan's domestic and external debt between 1993–2003. Total debt rose to 100 per cent of GDP in 1998/9, although this had come down substantially in 2002/3 and has over the last few years, remained between 55–60 per cent of GDP. As we show in Chapter 18, both key foreign debt ratios—external debt servicing as a percentage of foreign exchange earnings and of export earnings—fell a great deal in around 2001/2 and were far better then than they had been for many years. Until the huge debt rescheduling of 2002, most indicators regarding debt as a percentage of total revenue, tax revenue, current expenditure, etc. were not particularly impressive, which just goes to reinforce the observation made in Chapter 18, that 9/11 proved to be a real life saver for Pakistan, although of course, in subsequent years, the War on Terror caused huge human and economic damage to Pakistan. The period prior to debt rescheduling, 2000/1 in particular, has exceptionally worrying statistics, with foreign debt more than 60 per cent of GDP—see Table 11.7.

The general belief is that Pakistan's debt problem emerged from the profligate 1980s, when General Zia ul-Haq's government was spending far more money than it was receiving. Pervez Hasan in *Pakistan's Economy at the Crossroads* was one of the first who drew attention to this fact. He argued that while there were very high growth rates in the

TD: Total debt; DD: Domestic Debt; ED: External Debt; EL: Explicit Liabilities;

Note: In 1997/8 the State Bank of Pakistan changed its classification of external debt and included Explicit Liabilities which were not accounted for earlier—see chapter 16 for further details. This means that the data for 1993–97 is not strictly comparable to that of more recent years since there were definitional changes—which were justified improvements—which make comparison difficulty. Nevertheless, one can draw a great deal of inference from the data.

1980s, debt was being created which was being transferred to future generations who would eventually have to pay the high costs incurred during the 1980s.[50] The nominal public debt grew from around Rs. 155 billion to Rs. 802 billion in 1990 and further to 3,200 billion by 2000. The total debt burden was a mere 66 per cent in 1980 and rose to over 100 per cent by 1999. In 1980, the outstanding stock of public debt rose from 400 per cent of revenues to over 610 per cent by the end of 1999. Pakistan's public debt to revenue ratio in 2000 which was around 610 per cent was almost double India's (385 per cent), three times Mexico's (220 per cent), and ten times Chile's (60 per cent).[51]

Perhaps what is a surprising result is that it was the 1996–99 period in which the public debt burden rose very sharply, from 515 per cent of government revenues to 625 per cent, 'which was a more rapid increase than in the entire decade of the 1980s'.[52] The reasons for this are discussed below. Table 11.8 shows the real costs of borrowing and the real interest rates which were being used to repay the debt. In the 1980s, while the deficit was high and so was the accumulated debt, the economy was at least buoyant and growth was also very impressive; revenues were rising, development spending was high, and the economy was growing. The reasons why the debt burden increased so sharply in 1996–99 and the debt crisis came to the fore, was because growth rates had fallen in the 1990s and so had revenue. In the 1980s, there was real revenue growth of 8.2 per cent per annum while it was 3.9 per cent in the 1996–99 period, implying that not only was debt increasing, but it was becoming even more difficult to service the debt.[53] However, added to all this, the real crunch came when interest rates jumped from negligible levels in the 1980s and from a negative real interest rate in the early 1990s, to substantially high real interest rates in the 1996–99 period. One of the major criticisms that has been made against the way the Structural Adjustment Programmes in Pakistan had been imposed, had been around the 'liberalization' of interest rates. With a huge debt overhang and with high amounts of debt servicing at a time when the economy was doing noticeably poorly in the mid-1990s, and when governments were being changed frequently, interest rates were allowed to reach their 'correct'/market prices/levels. The result was that the Moeen Qureshi government, one of Pakistan's many caretaker governments, allowed interest rates to rise to the ridiculous level of over 20 per cent per annum, despite the fact that there was debt to be paid and the economy was in a poor situation. The consequences should not have been surprising to anyone. Clearly, the market had failed and in fact wrought havoc on an otherwise fledgling economy—see Box 11.6 for a hard hitting critique of the liberalization of interest rates, and see Box 11.7 in which Mahnaz Fatima and Qazi Masood Ahmed provide a useful analysis and summary of revenue and tax issues in the 1990s.

While there were numerous repercussions to the domestic debt crisis throughout the 1990s, the government sponsored DRMS, surprisingly, rather candidly, adds that as a consequence of the aggravating debt situation and declining revenues 'there has been a serious upsetting of the balance between defence and development since the early 1980s. The share of development in total government spending, which was 40 per cent in 1980 and 25 per cent in 1990, declined to 13 per cent in 2000. *Almost all the increase in share of interest payments has come at the cost of development*. While defence spending in constant prices more than doubled between 1980–81 and 1999–2000, real development expenditure actually declined over that period'.[54] Defence expenditure is now 50 per cent greater than development expenditure, while two decades ago, development spending was two-thirds higher than defence.

The DRMS argued that 'large as the public debt in Pakistan is, the debt crisis was essentially triggered by the unsustainability of the level of the current account balance of payments deficits and the pattern of their financing'.[55] The

Box 11.6

Real Cost of Public Borrowing: Determinants and Trends

The real cost of domestic borrowing is the nominal interest rate minus the rate of inflation. As the table below indicates, the real costs of Pakistan's domestic debt have varied greatly over time. During the 1980s the average nominal cost of 7.7 per cent per annum was largely offset by an inflation rate of 7.2 per cent per annum. The real cost of domestic public debt was thus only 0.5 per cent per annum. At first sight, this may appear surprising because the government started paying very high nominal interest rates on National Saving Schemes (NSS) in the early 1980s while inflation was still relatively low. Two factors dampened the impact of high rates of return on NSS instruments on government interest payments. First, the initial weight of unfunded debt (borrowing through NSS) was small. Second, the reported interest payments on NSS were low because the bulk of this borrowing is in the form of zero coupon five or 10-year certificates, the interest on which is recorded only where the term certificates are encashed. There is thus a considerable lag in interest payments. But the principal reason why government nominal and real interest rates were low in the 1980s was that the bulk of government borrowing was at less than market rates as all interest rates were administratively determined and government debt was sold in segmented markets. The large reserve requirements for commercial banks (5 per cent cash reserve requirement and 30 per cent liquid asset requirement) forced them to buy low-interest Treasury paper.

Real Cost of Public Debt

(% Per annum)

	Real Cost of External Debt	Real Cost of Domestic Debt	Total Cost of Public Debt
1980s	3.4	0.5	2.5
1990–96	–0.9	–0.3	–0.5
1996–99	5.4	4.9	5.2
2000–4 (Projected)	4.4	4.4	4.4
2004–10 (Projected)	1.8	3.4	2.5

Financial sector liberalization, initiated in 1989 with the assistance of the World Bank, led to a full market-based auction programme for government borrowing. However, this liberalization was premature and ill timed because it assumed a quick reduction in fiscal deficit to sustainable levels (Hasan, 1998). Its impact, on the contrary, was to sharply raise the Government interest bill. Between 1987–88 and 1993–94 interest payments on domestic debt increased nearly trebled and the average nominal interest rate rose by 84 per cent to 11.5 per cent. Paradoxically, the much higher interest payments made the fiscal deficit reduction difficult and the Government resorted during 1990–1993 to very large borrowing from the banking system to finance the burgeoning deficit. The sharp acceleration in inflation during 1990–1996 ultimately wiped out the effect of higher nominal interest rates, so that average real interest rate on government domestic debt was slightly negative during 1990–1996.

For the most part of the last two decades, the real cost of government domestic borrowing has been negligible and, therefore, the growth in burden of public debt was moderated. The situation now is sharply different. The real cost of domestic borrowing jumped up to the average of 9 per cent per annum over 1998–2000, as the inflation rate dropped and nominal interest rates stayed high. Even with the sharp reductions in the rates of return on the NSS since May 1999, the average interest rate paid on these schemes will remain high for some years because of the very substantial time lags mentioned above. The Debt Committee is assuming that the real cost of government domestic borrowing can be brought down to 3–4 per cent in the coming years mainly through a sharp reduction on rates offered for fresh borrowing.

The issue of interest payments on foreign debt has not received much attention, at least in relation to public debt. Nominal interest payments on foreign debt at Rs. 47 billion in 1999–00 were only a fraction of the interest payments on domestic debt of Rs. 198 billion. As a percentage of GDP, interest payments on foreign debt have rarely exceeded 1.5 per cent. The average annual nominal interest rate on external debt until recently did not exceed 4 per cent because in general Pakistan avoided high cost commercial borrowing till the mid-1990s. But just as in domestic debt, the relevant rate for external debt is the real rate of interest after allowing for international inflation. International inflation, already low in the 1980s, came down to zero during 1995–1999, implying a steady rise in the real interest rate on Pakistan's foreign debt in dollars. Furthermore, there has been real devaluation of the Rupee, which increases the real interest rate by increasing the real burden of external debt. There has been, in fact, substantial real depreciation of the rupee during the 1980s, relatively little change during 1990–1996 and significant real devaluation since then.

In estimating the real cost of foreign public debt, the Committee has added the capital loss on foreign exchange to the nominal interest payment on external debt and then adjusted this nominal cost for the rate of domestic inflation. The calculations suggest that real cost of external debt averaged 3.4 per cent per annum during the 1980s. It has risen significantly since then, reflecting both low international inflation and the accelerated pace of real depreciation of the Rupee during the last few years. For the period 1996–1999, the real cost of external borrowing is estimated at 5.4 per cent per annum, even higher than the high cost of domestic debt. In projecting future costs of external debt, it is necessary to take into account the expected changes in the nominal value of Pakistan's currency, which captures both the differential between international and domestic inflation and real depreciation, if any.

Box 11.7

Fiscal Issues in the 1990s

The overall policy thrust during the decade of the 1990s was, therefore, to increase the overall tax-to-GDP ratio by focusing on generating a greater share of direct taxes. There was commensurate emphasis on liberalization. The assumption was that decrease in custom duties would discourage smuggling and would thereby enable higher domestic production that would, in turn, contribute to higher tax generation overall. This assumption did not bear out as it appeared that smuggling in Pakistan became more an administrative issue than an economic issue. By and large, domestic industry was still ill-equipped to compete with imported finished goods. Import duty reduction would, therefore, have an adverse impact on domestic production capability, thereby adversely affecting tax revenue generation. The upshot, therefore, was a lower share of custom duties which would be offset through a higher share of sales tax and periodically through petroleum surcharge.

The decade of the 1990s can, therefore, be seen as the one throughout which there was a great emphasis on increase in direct taxes, reduction in import duties, and compensation of the loss in revenue due to the latter through increase in sales tax. The combined effect of the above moves, however, did not make a dent in the overall tax-to-GDP ratio which not only fluctuated between 10.48 per cent and 12.26 per cent but actually fell from 11.82 per cent in FY1991 to 11.71 per cent in FY2001. Clearly, there were gaps not just in implementation but also in the taxation policy that was adopted under the influence of the IMF that emphasized rapid reduction in import duties which had been a major source of revenues in a country ill-equipped to increase direct tax collection efficiently and equitably. The effort during the decade of the 1990s can be characterized as one that aimed more at offsetting the loss from import duties' reduction rather than attempting to increase tax revenue generation as such. As is evident from Table 4, while the share of direct taxes increased from 16.6 per cent in FY1991 to 32.9 per cent in FY2001 and that of sales tax increased from 16.6 per cent in FY1991 to 38.3 per cent in FY2001, the share of import duties in total taxes fell from 40.8 per cent in FY1991 to 15.9 per cent in FY2001. The upshot was a bare minimum ability to maintain the overall tax-to-GDP ratio which may be viewed as an achievement given the reduction in import duties. Or, it may be viewed as a failure given the inability to increase direct taxes and/or sales taxes in proportions greater than the decrease in import duties.

The analysis demonstrates that the efforts to increase the overall tax-to-GDP ratio did not prove to be successful. However, the contribution of various types of taxes to total tax collection did change. While the share of direct taxes and sales tax increased, that of import duties fell significantly. Import duties underwent drastic reduction mainly under IMF's pressure to liberalize trade more than that required even under the WTO agreements. While this measure definitely affected domestic industrial production adversely as most domestic producers are still ill-prepared to compete with imported finished goods, domestic production effort also experienced the negative impact of increase in direct and sales taxes. As the IMF prescribed tax effort was deflationary, significant increases in output could not be recorded that could have fed back favourably into tax generation and budget deficit reduction.

The upshot was that a relationship between the tax-to-GDP ratio and the budget deficit-to-GDP ratio could not be ascertained. Despite this, the governments mostly remained determined to follow the IMF prescriptions about tax reforms too. The second Benazir government that resisted the IMF in import duty reduction soon found itself out of the office. Pakistan's taxation reform was, therefore, driven not just by domestic politico-economic considerations but also by those of the countries which are the major financiers of the IMF. These countries would like to have our economic frontiers thrown open so that their manufactured products and services find easy passage into the markets of developing countries.

As the overall tax-to-GDP ratio could not be increased appreciably, budget deficits had to be kept contained by decreasing the development expenditure. This was required all the more also because of increasing pressure on debt-servicing. As percentage share of internal resources in total resources declined due to the reasons discussed herein, the share of external resources increased. Pakistan's reliance on external financing increased due to a tax reform effort that remained unsuccessful not only intrinsically as it failed to generate more resources internally but also because it affected the production potential of the country adversely. This latter effect fed back into the issue of budget deficits and rising external dependence. More requirement of external financing means more of the financiers' conditionalities. That is, the above cycle stands reinforced when the need is to break away from it. While the fiscal reform exercise has been self-defeating, we pursue more of it as it suits both domestic and international politico-economic agendas.

Source: Fatima, Mahnaz and Qazi Masood Ahmed, 'Political Economy of Fiscal Reforms, *The Pakistan Development Review*, PIDE, vol. 40, 2001.

current account balance during the 1990s was on average 4.8 per cent of GDP, increasing further to 6 per cent if one (correctly) includes the Foreign Currency Accounts. Exports and remittances had both fallen to below par levels in this period and there was a decline in foreign exchange earnings from 1996 to 1999. Added to all this, as we show in the chapters on structural adjustment—Chapters 16 and 17—there was constant devaluation of the rupee which made it more expensive to service foreign debt in rupee terms, something that has continued to happen in 2011 and 2012. With the economy doing poorly, revenues not rising and an overall investment and confidence crisis in the country, it is not surprising that foreign debt and debt servicing kept increasing. As Box 11.8 shows, Pakistan paid back in terms of interest alone, much more than it actually borrowed, a strange arrangement if ever there was one.

Box 11.8

What Have Our Loans Cost Us?

Much has been written about our external debt, and rightly so. The fact that Pakistan's external debt is almost 54 per cent of our GDP is indeed worrying. Add to that the fact that the country's domestic debt is only slightly lower, and we have a major crisis on our hands. In this brief article, I propose to look at a critical dimension which relates to Pakistan's external debt and its repayment, which has been overlooked by most analysts.

The table below reveals a number of extraordinary facts related to the growth in external debt over the last decade. Perhaps the most astonishing revelation is that net addition to Total Debt Outstanding in the period 1990–2000 was $15.451 billion while in the *same period the total amount repaid as Interest and Principal was $36.611 billion*. Pakistan has been making average repayments to its loans enacted over many decades of the order of $3.66 billion annually over the last decade alone, and yet, has seen its external liabilities almost double. Much of these repayments have been based upon increased borrowing, suggesting that a substantial proportion of new loans enacted each year do not come into the country and are used simply to pay-off old debts. This is an important point to consider as this point is usually overlooked whenever a new loan is granted to Pakistan. The euphoria which follows such agreements ignores the reality that only a small amount of the new loan is actually available to be made use of in the country.

Another revealing feature of the table is the increase in the proportion of short and medium term debt over the last decade, which is probably responsible for the large annual repayments made each year as shown in column VI. In 1990–91, short and medium term loans were a mere 10 per cent of outstanding external debt to official creditors; this amount more than doubled in 1998–99 when it was 22.2 per cent, and since 1995–96 has been almost a fifth of the total debt. In contrast, long term debt has increased by only 5.7 per cent since 1994–95, while short and medium term debts have increased by 28 per cent over the same period.

There are two aspects to rely increasingly on short term and medium term debts. Firstly, by definition, they have to be repaid (or rolled over) far sooner than the longer term debt which could have a tenor of even a decade, compared to the one-to-three year shorter term debt. Secondly, because of its nature, this debt is far costlier than longer term debt. The IMF's three-year Enhanced Structural Adjustment Facility for example, which constitutes long term debt, carries an interest rate of only 0.5 per cent and has a five-and-a-half year grace period and a 10-year maturity period. In contrast, even IMF short-term loans (such as Stand-by Arrangements), which are far less costly than commercial loans, carry an interest rate which is a weighted average of rates on short-term paper of the five currencies which constitute the IMF currency, the SDR (Special Drawing Rights). The Annual Report 1999–2000 of the State Bank of Pakistan concedes the fact that due to the nature of the small and medium term debts, payments of principal (column IV) dominate those made as interest (column V).

Yet another important finding from the table is that in the last two fiscal years, the total debt servicing has fallen substantially. This has happened only because of the rescheduling that had taken place two years ago. The importance of this rescheduling can be gauged from the fact that in the last financial year 1999–2000, the total debt to be repaid had there been no such arrangement, was of the order of $7.827 billion

External Debt $ billion

Year	Total Debt Outstanding			Annual Debt Servicing		
	I	II	III	IV	V	VI

the highest ever. However, $4.084 billion was rescheduled and Pakistan had to repay only (!) $3.743 billion. It is difficult to imagine where Pakistan would have come up with the additional money had the rescheduling not taken place. The fact that the economy saw some signs of improvement and 'stability' reflected in a small improvement in the growth rate, were critically dependent on this rescheduling.

Probably the most important conclusion to draw from the table and arguments presented here is that Pakistan is caught in a deep debt (death?) trap from which there seems to be no way out. Those institutions and countries which have lent us money over the last few decades, have reaped great rewards from their investments. They are like the money lender or landlord, and Pakistan the indebted peasant, where just to survive and pay off some of our earlier debts, we are having to borrow, increasing further our debt liabilities in the process. Just as generations of peasants have been enslaved by their debts, so has Pakistan. Like peasants, we too have paid out huge sums of money in the form of interest and principal but despite this, rather than diminishing, our debt liability has increased markedly.

Over the last two decades whenever I have spoken about the international financial institutions and donors, and have shown how loans and debts have had a negative impact on Pakistan's economy bringing it on the verge of bankruptcy and default on so many occasions, I have always been asked: then why do these institutions and countries make loans to a country like Pakistan? The answer from this table should be quite obvious. Even near-bankrupt and close-to-default countries like Pakistan, are profitable investments for the loaners. Not only do they get far more than what they loaned, the debt liability increases and countries like Pakistan are caught in a perpetual debt trap having to make repayments for years to come. A very profitable business indeed!

Source: Zaidi, S. Akbar, 'What are we paying for our Loans?', *Pakistan Journal of Applied Economics*, vol. 15, nos. 1 & 2, 1999, (published in 2001).

It was the 1996–99 period again, in which there was further deterioration in the external debt situation, while all the relevant variables were deteriorating—see Table 11.9. Based on Table 11.9 the DRMS report argued that during the 1996–99 period, 'the real interest rate on external debt rose while real growth in foreign exchange earnings turned negative. . . . Given the enormous current account balance of payments deficits and the very fragile pattern of their financing through RFCDs [Resident Foreign Currency Deposits], there was a certain inevitability about Pakistan's foreign exchange crisis. The imposition of economic sanctions in June 1998 merely accelerated its arrival'.[56]

Sakib Sherani identified a number of 'principal factors' that had been responsible for Pakistan's high and increasing debt.[57] This list included deep seated structural factors and shorter term causes. These include a low savings rate far below comparable countries, and to make matters worse, national savings have been declining; there has been a lack of fiscal discipline, with tax revenue having declined as a per cent of GDP in the 1990s and in the 2000s as well, which indicates 'lower nominal growth in tax collection as compared to the increase in GDP'—political interference and weak institutions have been held responsible for this, as well as schemes such as the Motorway and the Yellow Cab Scheme; the public sector has borne large losses which the public sector in general has had to bale out; there was a decline in long term capital inflows over the 1990s, which 'compelled authorities to place greater reliance on expensive commercial borrowing'; agreeing with the DRMS based on the work of the IMF, the 'most important causative factor' behind the increase in external debt 'was the persistence of large non-interest current account deficits'; as we argue above as well, the sequencing of reforms has also been a problem with substantially higher market interest rates as a consequence of liberalization; the structural adjustment reforms also put a lower ceiling on bank borrowing for budgetary support, which forced government to shift to non-bank borrowing; and, there was capital flight as well, which caused the vulnerability of the external account—also see Table 11.10 for some international comparisons.

What is interesting and worth emphasizing, however, is the impact of Pakistan receiving considerable foreign 'aid'—a

misnomer, no doubt, for these are loans—and accumulating exorbitant amounts of debt. One would have expected that such huge amounts of inflows—see Box 11.8 and Chapter 25 on war and aid—would have benefitted the country in terms of growth and poverty reduction. However, in the case of Pakistan, foreign capital inflows have been used entirely to finance consumption, but moreover, 'the increase in foreign capital has resulted in lowering the savings by the same magnitude, and as such foreign aid may have contributed *almost nothing to growth*'.[58] Moreover, while this 'aid' has not been put to proper use, A. R. Kemal concludes, not surprisingly, that 'debt accumulation in the case of Pakistan is resulting in low growth'.[57]

While there are a large number of factors that may have aggravated the debt problem, Sherani argued that 'initiated in 1989 as part of financial sector liberalization under the aegis of the IFIs [international financial institutions], nearly trebled the interest payments on domestic debt between FY 1989 and FY 1994. The average nominal effective interest rate rose from less than 6 per cent to 11.5 per cent. The other factor which became increasingly relevant, especially for the latter half of the 1990s, was the frequency and magnitude of currency devaluation that took place'.[60]

Looking at the situation soon after 9/11, say in 2004, it was difficult to appreciate the fact that clearly, Pakistan had a massive and acute debt crisis just a few years ago, for all of the 1990s. The reprieve that the economy had been given, came about on the basis of fortuitous extraneous factors, and not on the strategy proposed by the Debt Reduction and Management Committee or on other factors. As a consequence, there was debt rescheduling worth $12.5 billion, debt write-offs, and the creation of sufficient fiscal space which allowed the government to target some key areas of the economy, notably development and poverty issues. A lower interest rate also helped, as did an increase in exports and growing remittances which helped raise foreign exchange reserves to over $12 billion, and further still. Nevertheless, with the total debt almost 57 per cent of GDP, it will always have a bearing on some aspects of the economy, such as interest payments, and will need to be kept as low as is sustainable. That sustainability will arise through higher economic growth, better and larger investments, and far

greater tax generation. Moreover, the claim by some sections of Pakistan's civil society that Pakistan's loans should have been written off, is made absurd, when what is required is greater accountability—see Box 11.9.

11.4 Summary and Further Reading

11.4.1 Summary

This chapter makes the simple, though important, point that fiscal deficits and expenditure by government in excess of its revenue are not always and everywhere 'a bad thing'. What matters is the type of expenditure and the context of the fiscal deficit. We have looked at the conventional wisdom which states that numerous ills that afflict the economy are said to originate from high fiscal deficits. After looking at the more general arguments, in which we showed that it is not always such a good idea to reduce public spending or to have a fiscal surplus or balanced budget, we then examined the specific case of Pakistan.

In the case of Pakistan, it seems that conventional wisdom regarding the fiscal deficit has been turned on its head. The high fiscal deficit did not do all the things it was supposed to, and until more recently was rather 'benign', yet, at around between 4–6 per cent, the fiscal deficit in Pakistan is an important issue.

We have emphasized the point that, in itself, the fiscal deficit should not be of concern. What is critical is the use to which public money is being put (Box 11.5 and Appendix 11.2). If government spends more on the military and on interest payments, as opposed to the social sectors and development, causing the deficit to increase, that is a worrying sign. It is important to have some accountability about where the domestic and foreign debt has gone. Has it been used productively, or has it been squandered away? Hence, the question of public expenditure and fiscal deficits may be better answered by recourse to issues and ideas of governance, rather than according to the rather limited concerns of accountancy. Schemes like Nawaz Sharif's 'National Debt Retirement Programme' were meaningless given the huge size of the debt, and avoided issues of accountability—see Box 11.9. For this reason, we also suggest that debt retirement from privatization proceeds is improbable and would be a waste of money, which could be put to better use in social and infrastructure development (Appendix 11.3).

One problem that the debt raises is the high interest rate which government must pay on domestic debt, which was close to 20 per cent per annum in the mid 1990s, and rose again to 16 and 17 per cent in 2011 and 2012. The financial sector liberalization reforms under the Structural Adjustment Programme are partly responsible for these high interest rates, and are discussed along with the fiscal deficit issue in Part VI of this book.

As mentioned in Chapter 18, Pakistan, until 2002, had a massive debt problem, where debt was in excess of 100 per cent of the GDP. Debt servicing was eating away revenue received for development and other expenditure, and there was a serious debt crisis in Pakistan. Unlike most countries, Pakistan had both an external and domestic debt problem for most of the 1990s. We assess the causes for accumulated debt and found that reforms and structural adjustment had a crucial role to play in creating and aggravating this crisis.

After 2008 both, the deficit and debt, rose to extremely high levels and it is clear that here the IMF or World Bank were less to blame. The People's Party government's mismanagement, along with a number of negative global factors, aggravated the situation—also see Chapter 18.

11.4.2 Further Reading

There are no books which examine the issue of the fiscal deficit; some academic journal articles are all that are available. For the case of Pakistan, see: Zaidi, S. Akbar, 'The Structural Adjustment Programme and Pakistan: External Influence or Internal Acquiescence?', *Pakistan Journal of Applied Economics*, vol. 10, nos. 1 and 2, 1994; Zaidi, S. Akbar, 'Locating the Budget Deficit in Context: The Case of Pakistan', *Pakistan Journal of Applied Economics*, vol. 11, nos. 1 and 2, 1995; Haque, Nadeemul and Peter J. Montiel, 'Fiscal Policy Choices and Macroeconomic Performance in the Nineties', in Nasim, Anjum (ed.), *Financing Pakistan's Development in the 1990s* (Karachi: Oxford University Press, 1992); Haque, Nadeemul and Peter J. Montiel, 'The Macroeconomics of Public Sector Deficits: The Case of Pakistan', Working Paper no. 673,(Washington DC: World Bank, 1991); and Haque, Nadeemul and Peter J. Montiel, 'Fiscal Adjustment in Pakistan', *IMF Staff Papers*, vol. 40, no. 2, 1993. See also the references cited in note 23—in particular, the World Bank publications.

For a more general treatment of fiscal deficits, see: Buiter, Willem, *Principles of Budgetary and Financial Policy* (Brighton: Harvester, 1990); Blinder, A. S. and Robert Solow, *The Economics of Public Finance* (Washington DC: Brookings Institute, 1974); Arrow, Kenneth and M. J. Boskins, (eds.), *The Economics of Public Debt* (London: Macmillan, 1988); Easterly, W. and K. Schmidt-Hebbel, 'Fiscal Deficits and Macroeconomic Performance in Developing Countries', *World Bank Research Observer*, vol. 8, no. 2, 1993; Easterly, W. and K. Schmidt-Hebbel, 'The Macroeconomics of Public Sector Deficits: A Synthesis', Working Paper no. 775 (Washington DC: World Bank, 1992); and Eisner, Robert, 'Budget Deficits: Rhetoric and Reality', *Journal of Economic Perspectives*, vol. 3, no. 2, 1989.

The following reports and papers are also useful: Fatima, Mahnaz and Qazi Masood Ahmed, 'Political Economy of Fiscal Reforms in the 1990s', *The Pakistan Development Review*, vol. 40, no. 4, Part 2, 2001; A. R. Kemal, 'Debt Accumulation and its implications for Growth and Poverty', *The Pakistan Development Review*, vol. 40, no. 4, Part 1, 2001; Sakib Sherani, 'Escaping the Debt Trap: An Assessment of Pakistan's External Debt Sustainability', *Pakistan Resident Mission Working Paper No. 1* (Islamabad: Asian Development Bank, December 2002); and perhaps the most important, *A Debt Reduction and Management Strategy*, produced by the Debt Reduction and Management Committee of the Government of Pakistan, March 2001.

Box 11.9

Accountability, Not Write-off

Civil society's 'demand' for a write-off of Pakistan's foreign debt following the floods and the devastation they have caused, while well meaning, is a serious case of flawed politics. It is also, sadly, reflective of many aspects of civil society which many observers, even those sympathetic to civil society, have critiqued for some years now. Perhaps the most important observation following this so-called demand is, that civil society has now become completely depoliticised and members and organizations which constitute civil society, have now become part of the status quo of the state, rather than in contradiction to it, challenging that status quo. Had the finance minister or the prime minister made such a demand, one would have understood, but civil society has only exposed its own lack of political understanding.

Clearly, Pakistan's debt of $55 billion is a huge burden on the economy and on the common people. However, the problem is that the loans that 'Pakistan' has acquired over the last three decades when the debt problem got out of hand, have all been taken by Pakistan's governments, both military and those composed of Pakistan's civil and political elites. The 'common man' (seldom the common woman) on whose names these loans have ostensibly been taken, has never been consulted, although she has had to bear the burden of these loans and the debt they have created. While Pakistan's elites who are represented in government take these loans, usually so that they do not have to impose taxes on themselves, it is left to the common man and common woman to pay back these loans, through higher indirect taxes, reduced subsidies, and increased surcharges.

On the one hand then, it makes sense to make the demand that this unfair burden be lifted from Pakistan's poor common men and women, and this is why the government of the day can make such requests to donors. However, the bigger problem is a political economy one: the question needs to be asked as to what has happened to the loans taken by this and previous governments. While loans of many billions of dollars have been taken in the past and continue to be taken, there is little to show in terms of development output which would have suggested that the money has been fairly and honestly utilized. All evidence points to the fact, that there has been much embezzlement and misappropriation of the money received in the name of Pakistan's common people, and there are allegations that even humanitarian aid money which came in after the 2005 earthquake, was pocketed by some of those in power. If this is indeed the case, civil society needs to ask questions about the use of that aid and those loans. If it can prove—which would not be very difficult—that much has been stolen, it needs to hold the leaders and governments who took the loans, to be made accountable to the people of Pakistan on whose name they keep going back for even more loans.

It is accountability that civil society should be demanding, not debt write-offs. Civil society needs to make an assessment of the amount of aid taken in the past, its use, how much was spent, and how much seems to have gone missing. It then needs to hold all governments accountable about the loans taken in the people's name. Moreover, it also needs to hold donors accountable to explain why they continue to fund dead projects and why they pump in huge amounts of money which is badly spent and often not accounted for. However, these are political questions, not those one expects an answer from a civil society which has also now become increasingly donor-dependent.

One finds it odd that civil society has asked donors to write-off debts, while its own donor-dependence has only increased in recent years. Just as the country has asked for increased donor assistance, so has civil society. Where else would human rights, or women's, or minority groups be, if there was no donor funding. There are few civil society initiatives in Pakistan which would survive without donor funding. In fact, many donors set the development and human rights agenda in Pakistan, and Pakistan's civil society and NGOs merely work on projects till the funding runs out. And often while civil society has held its elected representatives accountable—such as during the continuing fake degree scandal—and held government responsible for not fulfilling its promises, it has seldom volunteered to hold itself accountable for what it does or does not do, or how it uses donor funds.

Perhaps it is this reason why civil society organizations have launched a campaign for an 'unconditional' write-off of Pakistan's external debt, rather than for a campaign to hold donors and government accountable for the loans being taken in the people's name. For the most part, Pakistan's NGOs have increasingly become contractors doing the government's bidding, and civil society's voice would hardly be heard if it was not for donor funding. A depoliticised, donor-dependent civil society is the last forum where one would expect to hear political demands. Pakistan's civil society needs to realise that in order for it to emerge as an independent entity, not as an appendage or mouthpiece for government, it needs to think and act politically.

Appendix 11.1

The Budgetary Deficit and the Economy

Aftab Ahmad Khan presents his considered opinion on the budget deficit and argues, like many others, that the large budgetary deficit is the most serious issue confronting the economy.

It is a well known fact that Pakistan has experienced large fiscal deficits over the last two decades and currently budgetary imbalance is the most serious macro problem confronting the economy, requiring bold structural policy actions with long lasting effects on financial stability. Repeated attempts by the government, including the implementation of structural adjustment programmes with assistance from the International Monetary Fund (IMF), have only achieved partial success. The consolidated fiscal deficit during the period 1980/81–1991/92 averaged around 7.2 per cent of Gross Domestic Product (GDP) annually. In 1992/93 this deficit was Rs. 107.7 billion or 8 per cent of the GDP. In 1993/94 it was brought down to Rs. 907 billion or 5.8 per cent of the GDP. In the current fiscal year (1994/95) while the budget estimated it at Rs. 71.9 billion (4 per cent of the projected GDP), the current indications are that it would be around Rs. 105 billion or 5.7 per cent of the revised projected GDP of Rs. 1846 billion.

It is crystal clear that Pakistan has to reduce the dimensions of the overall fiscal deficit; otherwise there would be further deterioration of the already weak budgetary position with profound de-stabilizing consequences for the economy. It would intensify pressures on the already strained balance of payments with consequent financial instability, thus undermining Pakistan's international credit worthiness, crowd out private investment by pushing real interest rates upward and/or fuel inflationary expectations as increasing monetization of the deficit becomes unavoidable. With large and growing deficits the economy could easily enter into a trap where an upward spiralling cycle of inflation–devaluation–rising interest rates–rising wages and salaries–rising inflation could disrupt production and investment activity and could lead to large scale capital flight.

The deficit has remained high because of the political and administrative inability of the Government of Pakistan to mobilize adequate resources or to restrain expenditures. The present tax structure of Pakistan falls short in all major functions of a modern tax system: revenue generation, efficient resource allocation, and equity. The system is characterized by the dominance of indirect taxes (nearly 78 per cent of total tax proceeds).

At the same time the system has many exemptions and concessions. Several income categories including agricultural are excluded from income taxation and those subject to taxation, with the exception of wage and salary earners, are known to pay only a fraction of their share. Despite considerable wealth concentration and sharp increases in asset values, especially real estate, Government revenue from taxation of wealth and capital gains is small. Tax administration is weak, resulting in a high level of tax evasion, corruption and harassment of taxpayers. In order to maintain the present low tax/GDP ratio (13.3 per cent in 1993/94), the tax system needs to be supplemented with frequent ad-hoc measures. In other words it is inelastic. Perhaps more importantly the tax system has haphazard effect on resource allocations as a large number of concessions result in widely different effective rates within the same industry. Moreover tax evasion has encouraged the growth of the 'black' or 'parallel' economy, which in turn results in cumulative revenue loss to the public exchequer.

On the expenditure front, defence spending accounts for 23.4 per cent of consolidated government expenditures and interest payments constitute 24.5 per cent. The share of general administration in total governmental expenditures is 6.7 per cent while social, economic and community services account for 15.4 per cent. With this pattern of current expenditures, it has not been possible to impose large cuts. The burden of expenditure reduction, accordingly, has fallen and continues to fall on development expenditure at the cost of renovating and expanding the much needed infrastructure facilities.

Pakistan, like most developing countries, makes use of three methods to finance the budget deficit: domestic borrowing from non-bank sources, external borrowing, and borrowing from the banking system. The magnitude of the deficit and the sources and amounts of financing since 1981/82 are depicted in [Table 1].

Each method of covering the deficit carries different costs and benefits for the economy. Besides the direct budgetary cost, domestic borrowing from non-bank sources can lead to crowding out of investment by raising the interest rates or as a result of non-price credit rationing. However, it has the benefit of avoiding or postponing the inflationary impact of the given deficit.

External financing helps to preserve domestic investment rates, but at the cost of crowding out future domestic consumption/investment when the foreign debt must be serviced or repaid through higher exports and lower imports.

Bank borrowing for budgetary support can be either from commercial banks or the central bank. When a commercial bank subscribes to a government loan, its cash (including deposits with the State Bank of Pakistan) is reduced. This act by itself involves a withdrawal of private purchasing power at the same time as there is an addition to public purchasing power. The expenditure of Government thus financed is, therefore, non-inflationary. But the crucial point is, how did the bank acquire the cash to subscribe to the government loan and how are the bank's future operations affected as a result of the subscription to the government loan? Assuming that the bank had no surplus cash when it made the investment in government securities, the cash needed for the loan subscription could be acquired out of the proceeds of maturing loans or maturing investments in government securities. In such a case, the new asset replaces the old asset, and the bank does not add to the aggregate volume of its assets (and liabilities). If this description were to apply to the banking system as a whole, the process of financing a

government deficit through subscriptions to government loans would be non-inflationary. Suppose, however, the banking system acquires cash for the purpose of subscription to government loans not out of maturing loans and investments, but through fresh deposits which it receives in consequence of depositors receiving additional incomes (which is liable to happen when disbursements exceed revenues raised by the government); the subscription to government loans will have taken place without reducing the existing investment in government securities (i.e. it would be net addition to resources lent to the government) and without reducing the existing volume of loans. In this situation, the process is inflationary, for the proceeds of loans when spent constitute a net addition to the amount of private purchasing power.

In the case of borrowing from the State Bank of Pakistan for financing the budgetary deficit, the process is clearly inflationary because the proceeds of borrowing when spent go directly to enlarge the cash basis (including deposits with SBP) of the commercial banks. Not only has the initial step of meeting the deficit through central bank borrowing increased the volume of private purchasing power, but the direct expansion of the cash of the commercial banks enlarges their ability to contribute to additional government loans or to make further advances.

In order to understand fiscal choices for the coming years, there has to be a clear understanding of the connotation of 'sustainable deficit'. This can be defined simply as the deficit level that can be financed without adding to the country's overall debt burden as a proportion of GDP, and without violating the government's macro objectives such as low inflation and real economic growth at the socially warranted rate, which in our case is at least 6.5 per cent per annum.

On the basis of studies conducted by the International Monetary Fund and the Ministry of Finance it appears that a fiscal deficit in excess of 4 per cent of GDP could have adverse macro-economic consequences including the danger of the economy sliding into the delirium of high inflation.

It has to be appreciated that the government's ability to create additional debt for financing the budgetary deficit is considerably constrained by the existing high level of indebtedness which at the end of 1993/94 constituted 88.4 per cent of GDP. The demand for Government debt could decline, if as a result of Government debt burden, the lender's confidence in the ability of the Government to faithfully fulfil its obligations in this regard is shaken or there is a fear of sharp erosion in the purchasing power of the rupee. In such a situation, the Government would also be forced to sharply raise its interest rates or further crowd out private investment.

In case the Government finds itself unable to increase its non-bank borrowing or cut its spending or enhance revenues by means of taxation, there is only one option: to monetize the deficit and collect a higher inflation tax. The scope of mobilizing additional revenues through inflation, however, is significantly reduced on account of the removal of restrictions on capital flows from Pakistan as well as foreign currency holdings by domestic residents. Expectations of an increase in the rate of inflation in the future would lead to acceleration in the pace of currency substitution, thus shrinking the Government's inflation tax base.

The need for reducing fiscal deficit to a sustainable level is thus clearly indicated.

Appendix 11.2

Public Debt Reconsidered

After the Nawaz Sharif government was returned to power in February 1997, it launched the 'National Debt Retirement Programme', and emphasis returned to the recurrent problem of public debt. Here we present a different view of the issue.

The issue of Pakistan's public debt has returned to the top of the economic agenda yet again. The country's two leading monthly magazines have devoted their cover stories to the problem of the 'exploding debt bomb', and a number of articles, many by eminent economists, have appeared in the press reiterating the claim that the problem of Pakistan's debt burden is the single biggest economic problem facing the country today. Moreover, the Prime Minister's National Debt Retirement Programme, an attempt to involve the public and capitalise on their patriotism and enthusiasm, is part of the same scheme of things, where it is hoped that the public will help ease the burden of debt upon the government, by reaching well into their own pockets and contributing to the government's coffers.

If ever there was consensus on one single issue of importance amongst economists, bureaucrats, and politicians, then it must be over the agreement about the huge and growing debt and upon its consequences. However, I will argue that this focus is misplaced. In the light of such sentiment which constitutes much of conventional wisdom, it is necessary to consider the importance of the debt and expose a number of myths which constitute this feeling.

The facts regarding Pakistan's debt, however, are indeed quite startling. Pakistan's domestic debt has accumulated to more than Rs. 900 billion, or 42 per cent of GDP, with debt servicing accounting for more than 5 per cent of GNP each year. The rate at which this debt has been raised is on the high side, with interest rates in nominal terms around 16 to 18 per cent, or between 4 to 6 per cent if we assume a (very conservative and undervalued) rate of inflation of around 12 per cent. Foreign debt accounts for about US$30 billion (46 per cent of GDP), but for the most part, carries a far lower, single digit rate of interest. Much of this is longer term debt, and despite Pakistan's immediate needs to meet some repayments which come due over the next nine months, the more serious and chronic problem is considered to be that of domestic debt.

Because of the large domestic debt, interest payments are high, and due to this, we end up having a large fiscal deficit each year. Interest payments and defence take up almost all of the budgeted annual expenditure, leaving very little for development and the social sectors. Given the excessive debt that has accumulated over the last few years, it is not likely that any recourse to patriotism will result in more than a minuscule amount being pocketed and the debt 'burden' or 'problem' is unlikely to go away for a long time to come. Given this fact, it is important to consider the other 'villain' of the piece, the fiscal deficit, and see what sort of impact that has on the economy.

Although many analysts frequently talk about Pakistan's annual fiscal deficit, and the IMF insists that it be reduced from the currently estimated 6.3 per cent of the GDP to 4 per cent by June this year (an irrational and ridiculous imposition, to say the least, and an impossibility, no doubt), what is often overlooked is the fact that the Primary Budget Deficit has been negative for the last few years. What this means is that in terms of the simple revenue/expenditure divide, if we exclude interest payments accumulated on past debt, then revenue, for the last three years, has been greater than expenditure. However, lest this fact result in an immediate cheer, it is necessary to point out that this positive balance over the last few years is not simply due to additions in revenue, but also due to larger cuts in expenditure.

In the current fiscal year alone, the original allocation for the annual development programme was reduced by 19 per cent from a mere Rs. 105 billion to a dismal Rs. 85 billion, by the caretaker government of Shahid Javed Burki. As Burki in a much cited article himself confessed, 'if this figure is finally realized, Pakistan would have scored another low in its economic history in terms of the proportion of gross domestic product committed to development'. In order to cut the fiscal deficit and be as close to the 4 per cent target proposed by the IMF and endorsed by the caretaker government between November 1996–February 1997, this year 1996–97, Pakistan's development expenditure will be no more than 3.4 per cent of GDP, down from a peak of 9.3 per cent a little over a decade ago. More interesting, however, has been the contrast in the pattern of expenditure on development with that on defence since 1980. Over the period 1980–90 when a military dictator ruled Pakistan for much of the decade, defence expenditure averaged around 6.5 per cent of GDP, with development getting 7.3 per cent. Currently, development receives less than half of what it got in the eighties, and receives only 3.4 per cent, while defence receives almost 6 per cent. Hence the composition of government expenditure is a critical factor overlooked by those who advocate its reduction.

If the question of the debt burden is to be considered, the fiscal deficit forms an important part of the equation. And, if the fiscal deficit is of importance, then we must examine the nature and the productivity of government expenditure, not simply its level or even the size of the deficit. This is the first factor ignored when issues of public debt are debated. To re-emphasize the point, we argue that it is not borrowing as such which is the problem, but the use made of borrowed money. The argument is valid both for domestic and foreign loans.

The problem then, is not to tell government to reduce its spending, as the IMF insists all governments should do at all times, under all circumstances, nor even the matter that government's try their utmost to raise taxes, as has been the case with ever increasing taxation in Pakistan in the recent past, but what is imperative is that government expenditure be productive. The essential and minimum requirement is the need to hold government accountable for spending productively. One of the many reasons why Pakistanis refuse

to pay taxes is that they feel cheated by government, in that they feel that their contribution to the exchequer is being squandered away. People may agree to pay more taxes only if they felt that their money was being used productively.

Another important caveat to the debt burden issue, linked to the efficient and productive use of expenditure, is the relationship between borrowing and growth. If the real rate of growth of the economy is greater than the real rate of interest at which government borrows, the problem is not a serious one at all. If economic growth can be sustained at around 7 to 9 per cent, a number of problems which persist in the economy and are related to the debt/deficit issue will cease to exist. Firstly, a higher growth rate should generate a higher level of revenue to the government, both from direct and indirect sources. In fact, this is one of the assumptions which are inbuilt into the economic revival package of Prime Minister Nawaz Sharif announced last week. Secondly, the government can continue to borrow as long as the differential between the rate of growth and the rate of borrowing remains positive. Finally, higher growth may generate more investable funds for the economy, possibly also lowering the interest rate. In all this, a check by government on prices and on interest rates would be extremely useful as well.

It is unlikely that all of Pakistan's debt will ever be retired, and what needs to be put in focus is the current fiscal deficit, and particularly, the use made of government spending each year. Nevertheless, the large amount of accumulated debt in the past cannot be ignored, and it is essential that an evaluation be made of the use to which loans taken in the past have been put. Much of fiscal policy in Pakistan, which has resulted in the high debt in the first place, has been ill-conceived, impractical, and downright irresponsible. Current proposals for reducing part of the debt, such as debt-for-equity swap, privatization proceeds set aside for this specific purpose, and the use of the begging bowl, may make a small dent in the amount of debt outstanding. However, so as not to make the same mistakes again in the future, those responsible for creating the problem in the first place must be held accountable. This is the bare minimum for the success of any long term viable economic reforms package. The rest is mere window dressing.

Appendix 11.3

Debt Retirement is a Waste of Money

What should the use of privatization proceeds be? Debt retirement or social sector development? Here we present one view.

There is an argument which has been floating around for a few months which has been propagated in the press by many learned and well-reputed journalists. The argument is based on the following facts: Pakistan's domestic debt has grown to gargantuan proportions and was Rs. 744 billion or 44.2 per cent of GDP at the beginning of the current fiscal year 1994–95, and is equal to our foreign debt. Thus, total debt was equal to 88.4 per cent of GDP. At the end of the current fiscal year 1994–95, domestic debt outstanding is expected to rise by a further Rs. 102 billion, taking the total domestic debt outstanding to Rs. 846 billion on 1 July 1995. Debt servicing in the current fiscal year was supposed to be Rs. 136 billion, of which Rs. 82.7 billion (60 per cent) was meant for interest payments on domestic debt alone and the remainder was distributed between foreign debt repayment and interest on foreign debt. It is believed that domestic debt and interest on it each year are serious problems facing our economy which lead to high inflation, low savings, and other sundry problems. These proponents believe that the high interest payments each year are causing a huge drain on our economic resources and should thus be reduced.

On the basis of the evidence presented above, the argument which is being made is that Pakistan must retire some of its debt if is to deal with the problem of high deficits and low growth and other repercussions. In this regard, it has been suggested that the proceeds from privatization should be earmarked for debt retirement. In the current fiscal year, in excess of Rs. 40 billion were accumulated by the government through its privatization programme, and next year, the government hopes to acquire Rs. 100 billion from the privatization of 26 per cent shares of PTC alone. If UBL and Habib Bank are also privatized over the next couple of years, the government can hope to receive considerably more. Proponents of the debt retirement view believe that by using these privatization proceeds, the problem of domestic debt and its annual interest bearing component can be dealt with. However, this view is highly fallacious for reasons that I make clear below.

Some facts other than those presented above will help make things clear. Each year based on the trend since 1990 on average, Rs. 74 billion is added to our domestic debt. This year Rs. 102 billion will be added. In fiscal year 1994–95, Rs. 82.7 billion contributed towards interest payments on the domestic debt of Rs. 744 billion, which was 11 per cent of the total domestic debt outstanding. For the sake of argument, let us assume that the government of Pakistan, by some sleight of a magic wand is able to bring down the fiscal deficit to 4 per cent of GDP (from the likely 5.6 per cent this current fiscal year) and is able to maintain this level for the next three years. The critical point which most observers have missed is that even if the fiscal deficit is a mere 1 per cent of GDP—an impossible happening, no doubt—the debt will still grow and accumulate.

Let us construct a highly favourable scenario to illustrate our point. By using the proceeds from privatization for debt retirement, the following scenario takes place: First, let us assume that GDP is Rs. 1,847 billion at the end of this year

Table 1
(All in billion rupees)

	1995/6	1996/7	1997/8
Gross domestic product (with an annual growth of 6% per annum)	1,847	1,957	2,075
Fiscal deficit (at 4% of GDP)	73	78	83
Domestic debt outstanding	846	919	998
Interest payment without retirement (at 11% of domestic debt)	93	101	109
Domestic debt after debt retirement	846–100=746	819–100=719	797–100=697
Interest payments after debt retirement (at 11%)	82	79	77
Domestic debt for next year	746+73=819	719+78=797	697+83=780

Total interest payments without debt repayment of Rs. 100 bn for three consecutive years:
93 + 101 + 109 = 303 bn
With debt repayment of 300 bn:
82 + 79 + 77 = 238 bn
Net difference = Rs. 65 bn
By spending RS300 bn, the government saves Rs. 65 bn.

and grows at a constant high rate of 6 per cent over the next three years. Along with this favourable growth rate, we also assume that the government achieves its target of a fiscal deficit of 4 per cent of GDP over the next three years. This means that GDP will grow from Rs. 1,847 billion at the end of this fiscal year to Rs. 1,957 billion next year and to Rs. 2,075 billion for our third year of analysis. Similarly, the fiscal deficit in these three years at the rate of 4 per cent of GDP will be Rs. 73.9 billion, Rs. 78.3 billion, and Rs. 83.0 billion [see Table 1].

What is important here is that each year a considerable amount (4 per cent of GDP which accrues in the form of the annual fiscal deficit) is being accumulated as part of the domestic debt and is being added to it. Now let us examine the repercussion on interest payments each year. The total debt in our scenario increases from the present Rs. 744 billion, to Rs. 846 billion at the start of the next fiscal year, and then to Rs. 919.88 billion and finally to Rs. 998 billion at the end of three years. If we take the current rate of repayment of domestic interest, which is 11 per cent of domestic debt outstanding, we have the following figures for interest payments for the next three years: Rs. 93.06 billion, Rs. 101.18 billion and Rs. 109.8 billion in the third year when our domestic debt should have grown to Rs. 998 billion.

Although we have not introduced the possibility of debt retirement in our argument as yet, based on the above highly positive economic growth and management scenario, the following picture emerges: despite excellent management and control of the economy, total domestic debt increases by more than Rs. 73 billion each year, and interest payments on domestic debt alone will exceed Rs. 100 billion. Let us now bring debt retirement into the picture.

Let us also take a highly favourable scenario regarding debt retirement and assume that in each of the next three years, the government will amass the considerable amount of Rs. 100 billion from the sale of state owned enterprises and will use this amount exclusively for debt retirement. As can be seen from the table, despite such an extensive amount being retired each year, the net difference in interest repayment on the domestic debt would only be Rs. 11 billion each year, and we would still be paying more than Rs. 80 billion in interest on the earlier accumulated domestic debt alone.

The proponents of the debt retirement view have failed to distinguish between the concept of debt (which is a stock) and deficit (which is a flow and is added each year to the debt). They have also overlooked the fact that debt retirement of a huge amount of Rs. 100 billion each year will only make a very small, negligible net contribution at the margin. By giving up Rs. 100 billion, we will be left with a gain of Rs. 11 billion only. The privatization proceeds should be used for direct development projects rather than debt retirement, which will be a total waste of money.

33. Before anyone uses the 1992/3 data from Table 11.2 and scores a point arguing that finally, with a 7.9 per cent deficit, the IMF-predicted scenario of disaster hit Pakistan's economy, it is best to put things in perspective. The World Bank (1993) report has explained this as follows: The economy was severely affected by the 1992 floods, the worst in 50 years, which hit the country in August/September. There was extensive damage to crops and livestock, 15 per cent of cotton and rice was lost, and 10 per cent of sugar cane was ruined. Subsequently, there was a loss of exports from cotton and rice, an increase in the import of wheat, relief items, fertilizers and reconstruction material and equipment. On the revenue side, there was a loss of Rs.10 billion due to exemption from loan repayment, relief packages, and 'flood effectees' were given exemptions from a number of taxes. There was also an additional expenditure of Rs.13 billion on reconstruction and relief goods (World Bank, op. cit., 1993, 9).

Part 4

Devolution and Fiscal Federalism

Devolution, decentralization, delegation, and similar concepts related to granting more autonomy to sub-national administrative units, are now in much use as there has been a realisation, or at least an assumption, that smaller administrative units are better placed to deliver on social development and welfare. Local governments, especially, are perceived to be better-equipped to address the needs of the people with whom they interact. Moreover, assumptions are also made that, since local governments are 'closer' to the people they are expected to serve, they are also more accountable, and people in general have more control over such entities. This is the assumption even when local governments are not elected, but if they are elected, then there is supposed to be even greater accountability.

The irony in Pakistan's history, and there have been far too many, is that elected local governments have almost exclusively been the choice of military dictators, of which again, there have been far too many in the last sixty-six years. All three of Pakistan's military generals—Ayub, Zia, and Musharraf—proposed their own systems of elected local government as soon as they came to power. In contrast, when (real) elections were held for the Provincial and National Assemblies in Pakistan and parliament was elected, the elected governments at the centre or the provincial level, all did away with the elected system of the previous military dictators, not replacing those systems with their own. Hence, military dictators preferred elected local government under the guise of praetorian democracy at the federal and provincial level, while elected members of the National and Provincial Assemblies preferred to have administrators imposed as local government heads. This latter apparent contradiction explains the power of local government, where elected provincial members see it in conflict with their own sources of power. They undermine elected local government to enforce their own power.

These two chapters examine how different systems of local government have evolved in Pakistan and how they have performed. They also reveal that despite the proclamation that power had been devolved to the local level as General Musharraf often stated with regard to his District Government system, such 'power' was a fiction without the devolution of financial resources. Even if local government performed well in some cases, their lack of fiscal autonomy undermined their efficacy.

Chapter 13 discusses what just might be one of the more radical aspects of fiscal federalism and of provincial autonomy ever granted to Pakistan's sub-national units, after the 18th Amendment in the Constitution. Although it is four years since the passing of the 18th Amendment, as well as after the Seventh National Finance Commission Award, and there are many features of both which are incomplete and in contradiction with each other, Pakistan's administrative system, as well as its financial one, has been radically altered. Provinces now have become far more important, and richer, than ever before especially in terms of social sector development, although they may not yet have the human resources or skills required to deal with these new responsibilities.

12 Local Government and the Political Economy of Decentralization[1]

The decentralization, devolution, and deconcentration of power and the mechanism of delivery of services, undertaken separately or in some combination of all three, particularly in developing countries, has become the mantra of administrative, managerial and governance related interventions and reforms. Development theory and its practices, are no longer conceived to be seen as the prerogative of a strong, centralized state but, rather, smaller and more representative administrative and political units are presumed to be better at delivering and implementing development. Not only have the structures and the role of the state changed in administrative terms, but there has also been a simultaneous realization that forms of democracy and participation are essential to make development work. Perhaps over the last half century, these two notions, of devolving power and delivery along with the greater participation by the people, have become the *sine qua non* of development.

There has been a considerable and diverse response by international financial institutions, development agencies, donors, and independent governments to these two core changes that have been brought about over recent decades, and in particular after the fall of the Berlin Wall in 1989. In projects devised by donors and international development agencies, for example, some component of community participation and civil society participation has become a prerequisite for loans to be disbursed. In other contexts, due to social and political change that has taken place over the years, forms of people's power have emerged as one of the forces that not just respond to state-led initiatives, but actually lead them, as in the case of the Philippines and South Africa. In other countries where there has been a deep and growing tradition of formal politics and electioneering, as in India, civil society groups have played a significant role in countering formal democratic politics, offering solutions which are more suited to the responses of diverse communities. In other cases, development agencies have been able to persuade and, perhaps even force, governments to undertake reforms to restructure their government and state institutions. The effective role of civil society in redefining politics and property relations, as well as reconfiguring the state in its entirety, is best demonstrated by events and processes that unfolded in the late 1980s and early 1990s across Eastern Europe, led mainly by civil society groups. The case of Pakistan discussed in this chapter, in many interesting and critical ways, differs considerably from these numerous other experiences, and emerges as an interesting case-study which runs against the grain of many of the patterns observed across the globe.

The purpose of this chapter is to explore broadly, the decentralization and devolution debate and experience in Pakistan, in a political economy framework and context, with emphasis on contextualising power and examining issues of devolution and decentralization within a wider framework and context of state-society relations.[2] An attempt will be made to keep the debates on devolution in Pakistan embedded in a wider debate on postcolonial state-society relations and their context, with discussion on the meaning of the state to the ordinary people, and examining earlier experiences of devolution and decentralization. The changing nature of the Pakistani state, its class formation, and the nature of politics that emerges for participation, democracy, and civil society institutions, in a much wider context and not simply related to decentralization and devolution in a local government context, will need to be explored, so that one can locate the specific issues of local government and local power relations within the broad structure of state, class and transition—also see Chapter 26 and 27. Clearly, the main contribution of this chapter is that it follows this particular political economy approach and framework which requires a broader, more holistic view, and distances itself from a purely administrative/managerial/governance-related evaluation. This is an important conceptual point which needs to be understood and emphasized in order to get a full flavour of experiences, possibilities, and constraints within the context of this chapter.

The chapter will also include a discussion of identified strengths and weaknesses of devolution schemes with suggestions for further research. Its focus is on examining the political and institutional set-up of devolution and local government in Pakistan in a historical context looking at key issues as they exist.

This chapter makes use of the very extensive recent literature that has emerged on devolution and decentralization in the context of local government reform in Pakistan, as well as on the nature of the political economy of the state, classes and on the political settlement in Pakistan. It is important to point out that while we examine the historical evolution of decentralization, devolution, and local government in the broader political economy context, we are more concerned with recent—post 1999—events and attempts at reform than with earlier attempts, although we do discuss earlier processes in some detail as well. Within the literature on local government reform, there are two broad strands, one of which deals with administrative, managerial, financial and largely governance-related studies, many commissioned by donor agencies and undertaken by international financial

agencies and donors themselves, all in recent years after the takeover of the Musharraf regime in October 1999.[3] The other, more recent and in our opinion, far more interesting and creative work has emerged in light of examining the political economy nature of decentralization, looking at issues of class and state.[4] Linked to and prior to this, is the recent academic literature which has emerged and which examines issues related to the broader political economy of the Pakistani state—also see Chapters 26 and 27.[5]

12.1 Local Government in Pakistan

Given the broad scope and interest of this chapter, this is not a chapter which simply recounts a secular account of developments that have taken place with regard to decentralization as the history of local government. Its concern is more with contemporary issues post-1999, hence it focuses more on recent developments and the wider context in which they have taken place. The chapter begins with a brief account of previous attempts at decentralization in Pakistan and then leads on to developments over the period 1999–2005.

There have been three substantive interventions in the decentralization and devolution process and structure in Pakistan since 1947, manifest through different administrative structures of local government. While all three differ substantially from each other in substance and structure, they share many similarities, most importantly, in intention. The fact that all the three attempts at local government reform in the form of decentralization and devolution have been undertaken not just by undemocratic, unrepresentative, unelected governments, but by the three military governments which have taken power through force, gives the narrative in Pakistan a very different twist compared to other experiences. In fact, the irony of the history of local government reform in Pakistan has been that the three military governments which have ruled Pakistan directly for 33 of its 66 years since independence—and half as many years behind the scenes—have aggressively supported this process of devolution, while all elected governments have consciously undermined this tier of government. This contradiction, between democratic politics and the military's politics, perhaps underlies not just discussion about devolution and local government reform, but discussion about the state, society and politics in Pakistan.

This chapter begins with a presentation of the political and structural context of the 1959 local government reforms, known as the Basic Democracies system of General Ayub Khan. Section 12.1.2 then moves on to an analysis of the political, social demographic and institutional context of Pakistan's second military regime, that of General Zia ul-Haq and his local government system, a system that continued for eleven years even after Zia's death. Clearly, over a period of two decades between each set of reforms, there had been substantial demographic and social change in Pakistan, a fact that is also reflected in the nature of the local government reforms undertaken as well as in the nature of politics. Then, in Section 12.1.3 we look at the District Government system under General Musharraf, again in a broad political economy framework identifying key political issues that have emerged in the new millennium. In fact, one of the key underlying arguments and strands to the analysis in this chapter is, that it was political changes as well as socio-economic ones, around which the evolution of the local government system took place. Section 12.2 deals with financial issues related to local government, since the performance of local government has been very dependent on the availability of funds available to make it work. In this section we examine how financial issues have helped or hindered service delivery at a devolved level. Finally, in Section 12.3, we evaluate the politics of the devolution and decentralization process in Pakistan in recent years.

12.1.1 The Basic Democracies of the 1960s[6]

Coming in to existence on 14 August 1947 as an independent state, created out of the partition of British India, Pakistan emerged as a geographical entity and a country, but perhaps, a country without a well-formed state. It inherited the bureaucratic steel frame of British India which continued for many decades. The ruling groups of politicians and administrators had migrated from areas that became India, and in many ways were alien to the areas that became (West) Pakistan, one of the few explanations as to why democratic forms of government never took hold in Pakistan. Landlords and bureaucrats formed the broad nexus of rulers in Pakistan, which had little industry and no middle class. The political bodies constituted to undertake some form of constitutional reform, never agreed to any system or Constitution which could be put in place. In this political and institutional arrangement, the most important actor was Pakistan's military. Hence, in the first decade of Pakistan's existence, politicians were unable to come to political agreements and settlements, with different unelected groups of politicians being replaced by the head of state. Pakistan lacked adequate infrastructure, was highly rural and underdeveloped. Many of the country's problems were aggravated by the movement of 7 million refugees who came from India after partition, and rehabilitating them was Pakistan's first development problem. In a state which was far from modern, it was the two most modern institutions, the bureaucracy and the military, which set Pakistan on course towards a path of development, but also on a path, which in contrast to independent India, led from one military rule to another.

Douglas E. Ashford, writing in 1967, when General Ayub Khan was still very much in power, and soon to celebrate his Decade of Development, after examining two other cases of local government reform, wrote:

> The elaborate system of councils organized by the Pakistani military-bureaucratic oligarchy is certainly the most ambitious of the three schemes for local reform. . . . The ruling oligarchy has made local reforms the keystone of its domestic policy, and President Ayub Khan has regarded the Basic Democracies program as his most important reform.[7]

We will find in other sections where we talk about the two sets of reforms undertaken later, that exactly this sentiment was expressed by the two other military rulers in Pakistan as well. Ashford utters a hugely misplaced and preposterous statement about the Ayub regime which has also been repeated in other contexts almost forty years later: 'the Ayub regime has shown itself to be seriously and energetically devoted to the restoration of civilian government'.[8] However, there were not many in Pakistan who shared this feeling.

General Ayub Khan imposed the first Martial Law in Pakistan in 1958 and took over government from a group of politicians who were unable to resolve their differences, clearly not an uncommon occurrence in societies where issues take time to be resolved through dialogue and discussion. Ayub disbanded all previous partial political systems of government as they existed and restrained politicians through draconian measures. It is worth quoting Ashford again just for the absurdity of a statement which one finds repeated over time:

> With true professional perspective the president saw that irresponsible politics at the centre, and the consequent corruption and economic stagnation could only be prevented if new leadership was introduced and a more solid basis for political participation was constructed. His answer was the Basic Democracies plan, which was to provide an interlude for village instruction and revival.[9]

With the dissolution of all forms of representative government and with curbs on politicians, General Ayub initiated the structure and system of a form of devolution and decentralization which resulted in the system of local government in the guise of Basic Democracies. The Basic Democracies Order appeared in October 1959 and two months later Basic Democrats were elected. In April 1960, the Municipal Administration Ordinance specifically for urban areas was enacted, giving rise to what some observers think was an 'integrated pattern of urbo-rural local government in Pakistan'.[10]

The Basic Democracies Order 1959 envisaged a new system of local government built up through a hierarchical four-tier system. The 37,959 villages in Pakistan were divided into Union Councils in rural areas and Town Committees (in towns with less than 14,000 inhabitants) and Union Committees in towns with more than 14,000 inhabitants, at the lowest tier in the structure. The next higher tier was that of Tehsil Councils in rural areas and Municipal Committees and Cantonment Boards in urban areas, followed by District Councils and finally Divisional Councils, the latter two of which covered both urban and rural areas.

It was the lowest tier, that of Union Councils, Town Committees, and Union Committees which had members elected on the basis of adult franchise, who then elected a chairman from amongst themselves. The higher tiers had some members which were indirectly elected by these directly elected members, as well as members nominated by government. For example, each Municipal Committee had a Council composed of all the chairmen of Union Committees within the Municipal Committee, as well as 'councillors representing special interest and the officials' which came from 'Nation Building Departments', such as education, health, agriculture, public works, etc.[11] It is important to note, that in this highly restricted participatory and electoral framework, the far more important figure of the chairman of the Municipal Committee was appointed by the government. In other cases, an Assistant Commissioner or Tehsildar would be the chairman, with a Deputy Commissioner the chairman of a District Council and the Commissioner heading a Divisional Council. Clearly, the 'controlling authority' in every case, was the bureaucracy and officials of the government.[12]

Ali Cheema and his colleagues argue that this controlling authority by the bureaucracy, 'had the power to quash proceedings; suspend resolutions passed or orders made by any local body; prohibit the doing of anything proposed to be done; and to require the local body to take some action'.[13] Quoting H. J. Friedman writing in 1960, and clearly at odds with Ashford cited above, they concur that 'the Basic Democracies Scheme is not, in reality, democracy, for it does not represent control by the people over government power except in an extremely limited manner'.[14]

Given the fact that a very large majority of Pakistanis lived in rural areas, the structure of the Basic Democracies system was perceived by many, to be able to undertake development related activities along with the ongoing Village AID (Agricultural and Industrial Development) programme, and in fact it did have an impact and along with Ayub's land reforms, did play a role in transforming rural economic and social structures and social relations of production; after all, the elections of Basic Democrats were the first Pakistan-level elections in its history. However, it was the use of the 80,000 Basic Democrats as an Electoral College for the election of the President to consolidate his own rule, which was the real issue.[15] The Basic Democrats became a constituency for the military and particularly for General Ayub and there was, as is always the case with politics, ample opportunity for corruption and for patronage. As we show on a number of occasions below, whenever democratic politics comes into contradiction with the military's politics, and especially when the military's local government is confronted with representation, the artificial system set up by the military comes undone. The military and participatory or democratic politics, despite the military's attempts, do not go together.

Ayub Khan's civilian and military bureaucratic regime was a developmentalist regime, with equal and substantial focus towards increasing production and capital in both urban and rural areas.[16] As we show in earlier chapters, both industrial and agricultural output saw phenomenal rates of growth and in many ways altered the social relations of production irreversibly. Although there is debate about the reasons for the land reform of 1959, whether it was undertaken to break the hold of the bickering political landowning class, or to provide an impetus to the process of capitalist agricultural development, the consequences of the reform were that both outcomes took place. The hold of the large landowners was indeed dented, but more importantly, the reforms and the numerous other interventions that took place in the agricultural sector brought about nothing less than a revolution in agricultural production and social relations

of production, and in fact altered the face of Pakistan once and for all. Shahid Javed Burki has argued that, towards the late 1950s, landlords were again emerging on the political horizon, and Ayub Khan's shifting of power from Karachi to the Punjab and Rawalpindi resulted in more representation for indigenous and rural Pakistan, which is one reason why agriculture gained prominence throughout the decade.[17]

The 1960s witnessed the emergence and consolidation of many political groups and economic classes. In agriculture, the hold of the large landowners may not have been broken, but it was certainly shaken enough to allow other economic categories to emerge. Many of the large landowners had the foresight to read the writing on the wall, and accepted the Green Revolution technology package introduced by the government. Although this was an élite farmer strategy, given the high costs associated with the purchase of tractors, the sinking of tube wells, and other ingredients of the package, state subsidization gave the middle farmers, too, the opportunity to adopt this technology. This was the essence of the Green Revolution: the middle and kulak farmers, along with many other farmers at both ends of the spectrum, emerged as capitalist farmers, soon to become a dominant economic and political force in agriculture and in the country.

In the rural areas, alongside this emerging capitalist farmer we also see the genesis of the small-scale manufacturers, and the skilled and technical workers, the growth of an ancillary service sector in order to service the new economy, and a disenfranchised, landless agricultural wage-labour class. To some extent, the political ambitions of the newly emerging agricultural capitalists were accommodated in the Basic Democracies scheme of Ayub Khan, but without giving them any real political power. This was perhaps the beginning of the apprenticeship of this class of rural politicians, which was to emerge, especially in the Punjab, in the 1970s and was to stamp its mark on the political economy of the country. The military and civilian bureaucrats under Ayub 'had forged a strong political alliance with a number of middle class urban and rural groups', which helped in fostering economic development and political participation. Moreover, the Basic Democracies system 'not only gave a voice to the middle class peasantry of Punjab and the NWFP, but also converted Pakistan's powerful civil bureaucracy from an apparatus for maintaining law and order into a remarkable vehicle for promoting development'.[18]

In essence then, as social transformation took place, with increased urbanization and with the emergence of different factions of the middle class, with rural to urban migration rising, these processes came into contradiction with the structure of government established by Ayub—and not just the Basic Democracies system, but the whole edifice—came crumbling down. Once an originally designed 'non-political' governance structure came into contradiction with the wider politics of the time, it was not able to function adequately, if ever it did, with its bureaucratic authoritarianism which may have become, at times, a softer, benevolent bureaucratism.

The Basic Democracies system was, and was seen to be, one of the most important initiatives of the Ayub regime and was perceived to be closely tied to him. As Rizvi states,

> the political super-structure of Ayub Government rested on the foundations of Basic Democracies, a political system which reflected the political philosophy both of the soldiers and the bureaucrats'.[19] Once the broader political structure of the Ayub regime began to collapse, as it happens so often in Pakistan, many of the initiatives of a fallen regime are removed with it. Such was the case of the Basic Democracies system. With the system in abeyance under General Yahya Khan who replaced Ayub after he surrendered to the political forces let loose by the process of demographic and social change, it took the newly elected President, Zulfikar Ali Bhutto, to say a few days after assuming power in 1971, that 'I am abandoning the system of Basic Democracy that has bred nothing but nepotism and corruption, a system that reduced democracy to a farce.[20]

The democratically elected Bhutto promised to introduce a better system of local government. Although two Local Government Ordinances were introduced in 1972 and in 1975, there was no implementation of any sort of local government, and despite the doing away of the Ayub era's model, in many ways the unrepresentative structure of implementing government at the local level—largely through the bureaucratic structure—remained. There were, of course, huge differences between the 1970s and the 1960s, not least because there was an active cadre of political workers at all levels of governmental and civil society levels, most of them members of political parties, who were involved in some form of intervention in development. Rather than a formal structure as under Ayub, there was a greater *awami* and populist culture of government, at times tending towards authoritarianism. In fact, it was this politicization of politics that probably stopped Bhutto—like other civilian governments after him—to undertake any real reform at the local level. Ali Cheema and Shandana Mohmand argue that Bhutto did not want to undertake local government reform due to the

> fear of losing local support in key areas to competing mass-based regional parties. . . . Perversely, the rise of competing mass and cadre-based parties and the increase in electoral competition at the provincial and local level in 1970 made Bhutto more reluctant to actually decentralize power to the local tier.[21]

Nevertheless, for our purposes, we can conclude that the first democratically elected government in Pakistan did not bother to introduce a system of representative local government, and even the Constitution of Pakistan of 1973 agreed to in this period by all political parties, those in government and those in the opposition, failed to allot local government recognition as the formal, third tier of government in Pakistan. This is one of the many ironies that crops up across time in Pakistan.

12.1.2 Local Government in the 1980s (and 1990s)[22]: Urban Pakistan and the Middle Classes

With the imposition of Martial Law following Pakistan's second military coup and under its third military government in 1977, all political activities, as they had, almost two decades earlier, come to a stop. While General Zia ul-Haq promised elections within ninety days and did initially allow some political campaigning to take place, it was soon clear to most, that Pakistan was once again ready for the long haul under military rule. The national and provincial assemblies had been disbanded and the stage was set for the revival of all military government's favourite hobby-horse, that of some form of devolution and decentralization in the guise of a structure of local government. Exactly 20 years after Pakistan's first attempt at devolution following the Basic Democracies Order of 1959, the Local Government Ordinance (LGO) of 1979 were promulgated and elections were held to elect local councillors. Ali Cheema and Shandana Mohmand argue that like Ayub Khan,

> Zia ul-Haq combined political centralization in the hands of the army at the federal and provincial levels with a legitimization strategy that revived electoral representation at the local level. . . . History was repeated as non-representative political centralization and the revival of local governments again came at the expense of weakening the elected tiers at the federal and provincial levels.[23]

However, Pakistan was a very different country now than it was 20 years earlier.

For purposes of brevity, if we were just to identify some of the critical differences between 1959 and 1979, perhaps the single most important would be that Pakistan was half the country in 1979 compared to 1959 following the secession of East Pakistan, the majority province, to emerge as independent Bangladesh in 1971. Pakistan over these two decades had also become increasingly urban, certainly not in statistical terms, but in terms of influences and culture one could see the beginnings of an urban Pakistan, something that was to be further strengthened during the 1980s. So called 'feudal' agrarian social and economic structures and relations had also given way to more modern capitalist relations of production and exchange, following the Green Revolution, the implementation of two sets of land reforms, and with the mechanization of agrarian production. In 1979, one also sees the beginnings of the consolidation of the middle classes as political and economic actors, something that was further strengthened throughout the 1980s due to economic developments, particularly the Gulf boom over that decade. Importantly, the structure and system of local government introduced in 1979 also strengthened the role and position of the middle classes in Pakistan. Another critical difference between Pakistan in 1959 and 1979 had been that in the decade prior to the 1979 local government reforms, the Pakistani people had participated in two rounds of General Elections and some forms of democracy, however muted, had taken root. People had now experienced, and perhaps begun to understand, the meaning of participation and democracy. One needs to understand the Local Government Ordinance 1979, in light of these circumstances, and the consequences that the Ordinance let loose are predicated upon the conditions which existed at that time.

The Local Government System under the LGO 1979

In the Constitution of Pakistan 1973, which was suspended and in abeyance during the earlier part of General Zia's regime, the allocations of the functions of the federal and provincial governments are clearly specified. There are some functions which are the exclusive responsibility of the federal government, while others, according to the Constitution can either be performed by the federal or provincial governments. However, the existence of local governments was never formally embodied in the Constitution.

Local governments in Pakistan existed under the supervision of the various provincial governments, where provincial governments had merely delegated some of their functions and responsibilities to local governments by the promulgation of ordinances. The Local Government Ordinance of 1979, with its amendments was in operation in the Punjab, Sindh, and the NWFP, while Balochistan's local governments worked under the 1980 Ordinance. These ordinances specified the allocation of the residuary functions of local governments.

Under this Ordinance, in the urban areas there were four levels of municipal government—Town Committees, Municipal Committees, Municipal Corporations, and Metropolitan Corporations. The senior officers of these councils were elected by members of the council and the controlling authority was the elected house. There was a three tier system of local government in operation in Pakistan in the rural areas, where Union Councils, Tehsil or Taluka Councils, and District Councils existed. However, the middle tier, the Tehsil/Taluka level was usually done away with in practice by provincial government, and mainly Union Councils and District Councils existed, which were elected on the basis of adult franchise. The chairmen of these councils were elected by the elected members themselves.

The Local Government Ordinance specified two sets of functions to be performed by local governments. The differentiation between the two sets was between compulsory and optional functions. For the most past, most of the sets of functions for local governments in different provinces were more or less the same. There was further differentiation between the functions of a regulatory nature, and those that relate to the provision of services.

For the three larger provinces, a common list for all urban councils containing compulsory and optional functions existed. Thus, Town Committees, Municipal Committees, Municipal Corporations and Metropolitan Corporations (with the exception of Karachi) were supposed to perform the same functions.[24] The Karachi Metropolitan Corporation had been given additional functions. Due to the limited extent of urbanization in Balochistan, a smaller list of functions

existed for Town Committees. While there was a great deal of similarity of functions between the provinces, there were a few minor differences between what is deemed compulsory and optional. The largest Metropolitan Corporation in Pakistan, that of Karachi, had some additional responsibilities.

Like their urban counterpart, a long list of functions for the two-tiered, rural, local government also existed. Union Councillors were expected to perform civil, welfare, and development functions. The civil functions included the provision and maintenance of public ways, sanitation, and conservancy; the slaughter of animals; and the maintenance of wells, water pumps, and tanks. If calamities struck, the Union Councils were expected to undertake relief measures and other measures to promote welfare and health. The development functions of the Council included measures to increase food production, industry, and promote community development. The District Councils had optional and compulsory functions. Compulsory functions included the provision and maintenance of roads, bridges, public buildings, water supply, maintenance and management of hospitals, maintenance and construction of school buildings, etc. Many of the optional functions of District Councils were similar to those of Town Committees.

The Local Government Ordinances specified that a local area in the context of urban areas would be a town, municipality, city or metropolis; the corresponding local government was a Town Committee, Municipal Committee, Municipal Corporation and Metropolitan Corporation. Municipal status was primarily a function of population. Urban settlements with population ranging from 5,000 to 30,000 were generally designated as Town Committees. Municipal Committees had populations up to 250,000. Cities beyond that size and provincial capitals had either Municipal or Metropolitan Corporation status. Property tax rating areas generally extended to the Municipal Committees and the larger town committees. The status of local government functionaries was directly correlated with municipal status of the particular jurisdiction. While the number of councils varied, for the most part, there were two Metropolitan Corporations, 12 Municipal Corporations, 146 Municipal Committees, and 336 Town Committees functioning in Pakistan.

In urban areas, the four types of Municipal Committees had organizational setups which were more or less similar across the provinces. Despite the fact that urban Union Councils, from the Town Committee to the Municipal Corporations varied in size, and the latter may have been as much as a hundred times the size of the former, there were very clear similarities in organizational structure. There were always three sections or departments comprising general administration, finance, and engineering. Town Committees had just these three departments which grew in size and qualitative specialization as the size of the urban area increased, i.e. when it was represented by a municipal committee or corporation. Municipal Committees and Corporations were also very similar in the nature of their organizational structures, and both had two additional departments, viz. education and health. Furthermore, the accounts department consisted of two separate units, one for finance and the other for taxation.

The two Metropolitan Corporations of Lahore and Karachi, by virtue of their size had far more diverse and extensive organizational structures. For example, given the extensive nature of types of works which were to be performed in metropolitan areas, there was a need for additional departments which performed specialized functions pertaining to legal affairs, land management and development, etc. The larger Municipal Corporations in the country, along with the two Metropolitan Corporations also had development authorities functioning as parallel organizations within the cities. However, while the urban local councils performed more service related functions, the development authorities were more involved with engineering works and with urban and town planning as well as with traffic related issues.

Despite the large number of legislative functions of local councils and their often extensive organization and management structures, *very few functions by local councils were actually carried out*. In urban areas, essentially three basic (compulsory) services were carried out—garbage disposal, maintenance of roads and street lighting. In the larger cities, preventive health care was looked after by local government, which was beyond the scope of smaller urban councils. Most urban local councils were involved in the maintenance of water and sanitation services. Essentially, urban local councils had restricted their role to some of the compulsory functions which they were expected to perform. In smaller cities, even these compulsory functions had been unfulfilled by the local council because they either did not have the funds or knew how to undertake the compulsory functions.

In rural areas, the actual role of Union Councils and District Councils was even more limited than the role played by smaller urban councils. Some District Councils were involved in the development and maintenance of link roads and drainage, and that is about all. Union Councils had virtually no role in the development or maintenance of services. The larger District Councils had a partial involvement in the provision of preventive and curative health care and in animal husbandry.

Under the Local Government Ordinances of 1979, elections of all local bodies were to take place on an adult franchise basis, and did, in 1979 and 1983—for the story after that, see below. After the elections of all the members of a unit, the Chairmen, Vice Chairmen, and Mayors were all elected from amongst the members of the local council. The membership of each council was determined on the basis of the distribution of population in that region. There was some separate representation for non-Muslims, peasants, workers, and women, who were all to be elected by the members of the councils.

The degree of electoral representation—seats to population ratio—was highest at the lowest level of local government, the Union Council level, in rural areas. There was a maximum number of seats prescribed for district councils and municipal corporations in some provinces, which implied that the number of seats rose less than proportionately with respect to population. Close to 80,000 seats were contested in the local government elections, of which 89 per cent of the representatives sat in rural local councils, with 84 per cent in Union Councils. Since Punjab had the greatest share of

Pakistan's population, it also had the highest proportion of overall local government seats, viz. 68 per cent.

There were a number of formal and informal mechanisms which allowed, at least on paper, the representative population to be involved in the affairs of the local councils. Formal mechanisms for mass participation were included in the Local Government Ordinances. For example, in the case of taxation, every taxation proposal was published along with a notice in newspapers, so that members of the public could make their objections and suggestions. However, it was the informal channels of public participation which were, perhaps, more representative. There was, at times, a great awareness and involvement in the lives of the public of services undertaken by local councils. Expectations about the performance of local government are always high, precisely because the tasks which this level of government is expected to perform influences the lives of a large number of people at the local level. There is supposed to be frequent contact between elected councillors and their constituents, and opinions about performance are regularly aired. This was supposed to be, perhaps, the most sensitive tier of government and one in which the public was expected to be most directly involved.

Despite elaborate structures and responsibilities, it is very clear that in terms of service delivery, certainly one of the two most important pillars of decentralization and devolution in Pakistan in the form of the local government system—the other of course, being some form and some degree of political representation and participation—the local government system in Pakistan from 1979 to 1999 when it was still effectively in operation, failed significantly. Studies have shown that in terms of the skill level of local government staff and their aptitude and attitude—clearly, not a problem simply of local government but of all tiers of government in Pakistan—and due to the financial control by higher tiers by both the provincial and federal government, a problem that still continues to this day as we show below, and for a host of other reasons, *the local government structure and system failed to deliver*, even before political issues came to the fore—see below. Hence, it was not merely politics which undermined the potential and possibility of local government delivery in Pakistan, the system itself failed on technical and structural grounds.[25] However, politics did further accentuate the problem complicating matters considerably.

In their comparison of the Basic Democracies Order of 1959 and its subsequent Municipal Administrative Ordinance of 1960, with the Local Government Ordinance of 1979, Ali Cheema and Shandana Mohmand find that there 'was little change in the functions and financial powers assigned to local government. This indicates a continuity in the legislative structure of local governance and clearly shows that there was no intent during the Zia period to substantively empower local governments. The purview of these bodies continued to remain confined to the provision of essential municipal services with District Councils retaining the responsibility of rural developments. Similarly, there was little change in the financial powers given to local governments'.[26] While these similarities between both military dictators and their regimes may have existed in the structure—and perhaps even outcome—of local governments, much else, however, had changed.

The Intervention of Praetorian Politics

Three sets of Local Bodies elections were held in Pakistan in 1979, 1983 and 1987 as per the mandate of the Local Government Ordinance (LGO) 1979. There was no other representative forum for politics at that time in what is generally regarded as a particularly repressive military regime which had used the Islamic card as an excuse to prolong its rule. International factors after the Soviet invasion of Afghanistan in 1979 also helped perpetuate military rule in the form of Martial Law when numerous anti-people, especially anti-women and anti-religious minorities, laws were promulgated, and both women and minorities were the target of victimization and discrimination. The genius of the non-party elections at the local level was that they allowed existing and emerging political groups to be involved in local level issues, leaving the supposedly more important issues of the economy, foreign policy, federation, etc. in the hands of the military. Power throughout the Zia period, without a doubt, was highly centralized and rested with the military and its co-opted classes, fractions, and groups, particularly those that represented some Islamic faction and constituency and were General Zia's key partners.

However, while the military had its own favourites and carefully selected and favoured many social groups at different times, in different cities and provinces, and simultaneously persecuted the most popular political party, the Pakistan People's Party of Z. A. Bhutto later taken over by his daughter, social transformation was taking place independently, but also as a consequence of economic policies followed in this period. On the political front, it was the re-introduction of the Local Bodies elections that led to the political emergence, and possibly even consolidation, of the middle class, both urban and rural. Given the intrinsic connection between politics and economics in Pakistan, it is not surprising that each reinforced the other.

Since 'real' elections to the Provincial and National Assemblies were not held under Zia until at least 1985 (and how 'real' they were is a moot point), most of the traditional political entities did not take the first Local Bodies elections seriously. Also, because severe restrictions were imposed by General Zia's government on participation, many stalwarts were excluded. This allowed those with some financial and political means, essentially the emerging middle class, to contest elections, perhaps for the first time. They were able to enter politics because room had been created by the absence of the richer, more influential, traditional political actors. Local government seemed to work well under military dictators, and under Zia it seemed to work rather better, because of the relative importance given to this tier of government by the large developmental funds channelled through it. Urban and rural councillors were the only elected representatives of the regime, and were responsible and accountable, given their limitations, to the needs and demands of the electorate.

In 1985, General Zia's government decided to hold General Elections for the Provincial and National Assemblies on a

non-party basis. However, political parties did exist and new ones had emerged, such as the Muhajir Qaumi Movement (MQM) in Karachi, many of which had emerged as a consequence of the Local Bodies elections held earlier. While local government elections may also have been non-party elections, individuals did have party affiliations and identities which were further crystallized in the General Elections of 1985. What is interesting is that a very large number of individuals who had been trained, for the first time ever in politics, through the Local Bodies, emerged later as members of the National and Provincial Assemblies in 1985 and in subsequent elections. In 1985, of the 240 Members of the Punjab Provincial Assembly, 124 were sitting Councillors; of the eleven Metropolitan/Municipal Corporations of Punjab and Sindh, at one time or another, mayors of as many as *ten* had been either Members of the National Assembly or Members of the Provincial Assembly; in the elections held in 1993, it was estimated that more than 70 per cent of members of the Punjab and National Assemblies started their political careers from local bodies.[27] These are quite amazing statistics which reveal a very important fact which we will discuss later, that of the importance of local government as a stepping stone for higher political power. Elections were held in 1979, 1983, and 1987, which allowed the same sections of the economic middle class to emerge as members of the political classes.

The main beneficiaries of the Zia regime were, then, members of the urban and rural middle classes, and members of the civil and, particularly, military bureaucracy. The large industrialists of the Ayub era also returned to Pakistan, although the nature of the entrepreneur under Zia was considerably different from that under Ayub. Rather than 22 families dominating Pakistan, there were perhaps a few hundred or a thousand under Zia. The industrialists under Ayub may have been richer than those under Zia, but there was probably less concentration at the top under Zia than under Ayub. However, despite this emergence of the middle class and of the new entrepreneur under Zia, political power was clearly retained in the hands of the military with a subservient bureaucracy. Large landowners, too, had made a comeback under Zia, hovering around the political establishment and being allowed some room in the 1985 elections. Nevertheless, the power of the military was endorsed by the summary end to Mohammad Khan Junejo's tenure as Prime Minister in May 1988. The military, through its considerable patronage of particular political parties and individuals—the Muhajir Qaumi Movement and Nawaz Sharif, are two of the best representatives of each category—helped create classes, parties, and factions of collaborative politicians, both at the local and higher tiers of government. Much of the intervention and interference in this period created and consolidated, what some observers believe, was the 'localization and personalization of politics at the local level.'[28] The somewhat unique concept of a praetorian democracy worked rather well for many months, but once elements of the democratic forces began to impinge upon the terrain of the military, the military demonstrated that it was well in control. The period during Zia's rule marks the first real demonstration and formal consolidation of the middle classes on Pakistan's economic and political map.

As far as our analysis is concerned, the 1985 General Elections created the first major tension and contradiction between elected local government and elections at the other two higher tiers. This pattern was to re-emerge throughout the 1988–99 democratic interregnum. As we argue above, a large number of local level politicians who had become prominent in their own region or constituency at the local level, contested the 1985 elections and were propelled to provincial and national level status, as were some political parties.[29] These politicians had begun to understand and recognize the role, influence, and the importance of the local level political process, and once they were elevated to higher status, anyone filling their local level seat, was seen as a challenger and upstart who could consolidate his/her position at the local level, eventually challenging them at the higher level. In an era—and even now—where politics was the politics of patronage, there were numerous individuals and groups as candidates, competing to appropriate that power and patronage. Local government had become important and politically powerful.

Since local governments were not a central part of the Constitution, and had been merely delegated powers by the provincial governments on the behest of the latter, it is not surprising that local governments actually owed their existence and powers to the provincial governments. Provincial governments could, and did, dismiss local governments, or on the advice of the federal government. Clearly, this was a highly subjugative, dominating relationship with local government having no independence from, leave alone influence on, the provincial government, and the provincial governments did use their influence on local governments at numerous junctures. From senior appointments to requests for more resources or the permission for increasing taxes and rates, local governments were completely dependent upon their provinces. It would not be unfair to say that local governments were controlled by the provinces; even the budgets of local councils had to be approved by the provincial governments, who were entitled to make amendments and suggestions.

Prior to the 1985 General Elections, in the absence of elected assemblies, local governments were the only popularly elected bodies and thus played important political and developmentalist roles. After the election of Members and Senators of the Provincial and National Assemblies, the role of local governments was substantially marginalized. These elected representatives had taken over some functions which local governments used to perform. Specific federal and provincial level programmes which were directed at elected provincial and federal members of parliament, such as the Five Point Programme of the Junejo government (1985–88), the People's Programme of the first Benazir Bhutto government, and other such programmes, had in many ways, intervened in the evolution of proper and improved local government and encroached upon the jurisdiction of the local governments. Under the above named programmes, elected members of Provincial and National Assemblies were given funds of considerable amount which they could use for developmentalist projects, largely on their own discretion, in their political constituency. This had severely undermined

the role local governments had been playing, despite the shortcomings mentioned above, in the development of particular (local) areas and regions.

What is perhaps more intriguing is, that in the period following the 1985 elections, but more so after the death of General Zia in 1988, when a more representative, albeit controlled, democracy with political parties emerged, local government was dispensed with. With the return of democracy in Pakistan, all local governments were dissolved. In the NWFP, all local bodies were dissolved in 1991, in Sindh in 1992, and in the Punjab in August 1993. Different reasons were given as to why the provincial governments dissolved the local governments in their own provinces. In the case of the NWFP, mismanagement and corruption were cited as reasons, while the Punjab provincial government dissolved its local governments in order to ensure that national elections to be held in October 1993 were not influenced by incumbent local government officials. Thus, in the absence of democratically elected local government officials in the rural and urban areas, Town Committees, Municipal Committees, and Municipal Corporations, were all being run by Administrators who were members of either the federal or provincial public (civil) service cadre. Administrators were appointed by the provincial government and were transferred between different posts for unspecified duration of tenure. This fact that the elected principle of local bodies was put in abeyance, reflects on the attitude of elected and non-elected government officials. There seems to be an inherent conflict of interest between different tiers of government, where local governments, because they are assumed to be the most expendable, have borne the brunt.

The local government reforms launched by General Zia ul-Haq in 1979, largely to extend his rule by centralizing power in the military and allowing local level politicians to do politics, and perhaps some development as well, continued up to 1985. However, even under General Zia's own praetorian democracy, local governments floundered as many of the former councillors, mayors and chairmen graduated to the Provincial and National Assemblies. After 1988, however, when four General Elections were held in Pakistan, local governments became almost redundant, primarily because they became *competing centres of patronage and power* in contrast to elected representatives at the two higher tiers. Since the higher tiers had the power to dispense with these local governments, as argued above citing different reasons, they did exactly that. With the return of democracy in 1988, local government was made largely redundant. It had to be Pakistan's third military coup and fourth military ruler, General Musharraf who took over power in 1999, to resurrect a completely new system of devolution represented through yet another local government system under the Devolution Plan 2000 which set up District Governments.

12.1.3 Devolution in the New Millennium

An examination of three military takeovers and coups in Pakistan, in 1958, 1977, and 1999, and the earliest speeches that Generals Ayub, Zia, and Musharraf made, show an uncanny resemblance for the causes and explanations for the takeover, and the intention and programme of each General. The speeches are so similar that they could have had the same speechwriter. While corruption and inefficiency and the incompetency of politicians—always politicians—are cited as the reasons why they ousted (in the last two cases at least) democratically elected governments, each General, especially the last two, also emphasized their supposed commitment to democracy. They all said they wanted a good, accountable, and open system of democracy for the country. And, they all felt that power should be devolved to the people in some form of decentralization in the form of local government. In fact, perhaps the first substantive political intervention of all three military governments was the promulgation of ordinances that brought about three different structures of local government. In this section, we examine the Devolution Plan and the District Government system initiated in 2001, by General Musharraf.[30] Before we turn to the local government reforms, a brief description of the politics of the Musharraf regime in the context of the reforms that were undertaken is given.

The Politics of the New Millennium

The parallels between General Zia and General Musharraf's regimes, even with regard to their attempts to start devolution by setting up a local government system, are quite remarkable. Both military leaders set about bringing a local government system soon after taking power, before major world and regional events changed the nature and status of their regime permanently. General Zia started his local government reforms in 1978 and 1979 at a time when his position was weakening. However, after December 1979 when the Soviet Union invaded Afghanistan, Pakistan's status of a frontline state propelled General Zia to the world stage ensuring his longevity with American support. Almost the same scene was repeated with regard to General Musharraf's political career, although in his case, his position, because of US support, remained far stronger than General Zia's ever was. General Musharraf got to work on his local government reforms immediately after dismissing the democratically elected government of Nawaz Sharif in October 1999, at a time when his position was being questioned as the supposedly pro-democracy West castigated him for dealing a death blow to democracy, however weak it was. However, after 11 September 2001, and after the second invasion of Afghanistan, this time by the only super power in the world, General Musharraf too, was propelled not just on the world stage like General Zia, but perhaps, along with President George Bush and Prime Minister Tony Blair, as one of the most important leaders in the US War Against Terror, once again ensuring a very long political career.

Under the leadership of General Pervez Musharraf, the military reclaimed its central position in Pakistan's state structure and political scene, as it had in the past, but far more decisively and overtly. The naiveté which many of us believed throughout the 1990s that the military had removed itself from power and had allowed the democratic transition to continue unhindered—as it has in some countries—received a major shock with Pakistan's third military coup and fourth military head of government.

General Musharraf, first as Chief of Army Staff and Chief Executive of Pakistan, and then in his subsequent position, of President of Pakistan but still Chief of Army Staff, began his political interventions by beginning work on his Devolution Plan in 1999/2000. Non-party based elections were held for representatives to be elected to the new District Government setup in 2001, and the new system of local government was put in place in August 2001. A highly contentious and controversial referendum was also held in Pakistan, just as it was under General Zia ul-Haq, which gave General Musharraf the perceived right to remain President for another five years—not that any General has ever required legitimacy from any referendum, with the power of the military might determining that so called 'legitimacy'. After ensuring his own mandate and after the local government elections, General Musharraf held General Elections—again like General Zia, although this time these were party-based elections—in 2002, and set in motion the process of party-based politics after the party-less local government elections, again similar to General Zia. Hence, there existed a highly vocal and diverse representation in the Provincial and National Assemblies where members were elected on party tickets, as well as representatives at District Government, who were elected prior to this, on a party-less basis.

The Structure of District Governments[31]

The political issues related to the Musharraf regime notwithstanding, the Devolution Plan and the new system of District Government require a study on their own merit. This section does just that. The District Government structure was an integrated three-tier system, where rural and urban areas were linked together organizationally and administratively, perhaps in response to the changing demographic and locational distribution of people in Pakistan, perhaps even emphasizing the primacy of urbanizm as a way of life by removing the urban-rural divide. The system of local government ran from the Union to the Tehsil and then District level, from the smallest electoral and administrative unit to the highest.

The three-tiered structure was based on the Union/Tehsil/District levels/stages of administrative hierarchy, with the Union being the first level of contact in this structure, rising to the more important and powerful District Council. The Union Council had an elected representation with the Union *Nazim* and Union *Naib Nazim* as the heads of the Council. The Union *Nazim* was responsible for the preparation of the Annual Development Plan of the Union Council and decided the priorities and proposals with the Council. He was responsible for the execution of those projects for which funds had been provided by the Union Council budget. He was to send those proposals to the Tehsil Municipal Administration and the district government for inclusion in their budgets and development plans which were beyond the scope of the Union Council resources. The Union Council, the lowest level of elected government, had an average population of around 25,000, corresponding to several small villages or sub-villages and sub-towns in the larger settlements. Each Union Council consisted of 21 members elected on a non-party basis.

At the tehsil level, the *Naib Nazims* of all Union Councils in the Tehsil became part of the Tehsil Council, which was headed by a Tehsil *Nazim* who was the head of the Tehsil Municipal Administration. He was also expected to make an Annual Budget Development Plan for municipal services at the Tehsil level. Since this was one higher rung on the District Government tier, the structure of administration was slightly more advanced than at the simple Union Council level. The Tehsil *Nazim* headed the council and was responsible for efficient municipal service delivery and executing the development plans approved by the Tehsil Council. He was assisted by a Tehsil Municipal Officer and four other Tehsil officers. The Tehsil Council consisted of the directly elected union *Naib Nazims* and around one-third indirectly elected members such as women, minorities and peasants/workers. The Tehsil Municipal Administration which was responsible for municipal functions and spatial planning, included the offices of the Urban Local Councils established under the repealed LGO of 1979, with some sub-offices of the old system passed on to the tehsil level.

The District Council was the highest and most important entity in the new structure of district government. The system of administration at the district level included the *Zila Nazim* who had a large team of district administrators. The district administration comprised District Officers to carry out functions decentralized from previous provincial departments. Some of the offices may have represented a single department but had their group of offices headed by an Executive District Officer (EDO) at the District, such as Education or Health. Similarly other officers with related functions were grouped together under Executive District Officers. The work of the district administration was co-ordinated by a District Co-ordination Officer who reported to the elected head of government. The District Council consisted of the directly elected Union Council *Nazims* and around one-third indirectly elected members such as women, minorities and peasants/workers. Hence, the elected representatives at the lowest tier of government, the Union Council level, found themselves in the Union Council, with their *Naib Nazims* in the Tehsil Council and with the *Nazims* of the Union Councils making up the District Councils. The four provincial headquarters had been declared as City Districts and if/when a city or tehsil became urbanized and grew in size, it could be designated as a City District. In a City District, a Town Municipal Administration was organized on a pattern to the Tehsil Municipal Administration in any other district.

The major social sector departments of Education and Health were the key departments which had been devolved to the districts. Both of these departments had already undertaken some detailed planning for decentralization, prior to the devolution programme of the military government. The management of all primary and secondary schools and colleges was now the responsibility of the District Government and not of the provincial Education Department as in the past. The EDO Education, bore the major responsibility for ensuring that the educational needs of the District were adequately met; he was also responsible for planning and establishing new institutions where necessary. Amongst the duties and functions of the EDO

Education were the following: implementing the provincial education policy through the district education policy and plan; preparing plans for development of education in the district covering the levels that fall within the responsibility of the district; and preparing the annual educational budget of the district.

There had been many significant departures made from earlier models of local government under the District Government system in use in Pakistan. Firstly, a number of provincial government functions related to the delivery of social services had been devolved to the District Government. Moreover, many of the functionaries at the local level provincial administration had been transferred to the local government and were accountable to the elected district level administration. While there had been some decentralization in the sense that some provincial powers, duties, and responsibilities had been transferred to the local level, *there had been no decentralization of any federal level powers, duties, or responsibilities to either the provincial or district level.* Hence the accusation that in fact, rather than devolving power, *power had actually become centralized in the state* and its institutions, particularly in the military.

Despite the big claim made about the nature of devolution and decentralization by the Musharraf government, it is noteworthy that local government was still not part of the Constitution. Only the highly controversial 17th Amendment allowed some partial, time-bound protection to local government. One of the more important, perhaps revolutionary, interventions and changes made, however, had been the allocation of one-third seats reserved for women. Now women, in addition to contesting seats at any level directly, also had one-third seats available for them. Only three women were able to become *Nazims* in the 106 District Governments through direct elections and while there had been stiff opposition to this move in more conservative areas of the NWFP and Balochistan provinces, for the most part, there had been considerable space created for women to enter the political field. Of course, real and meaningful change takes time, but this was a very significant and positive development towards the politicization of women and bringing them in to the mainstream. Another equally important and impressive change had been the end of separate electorates for religious minorities who have once again been reintegrated into the political mainstream as well—see Box 12.1.

An important innovation with the District Government system, on paper at least, since it was not fully functional, had been the setting up of Citizen Community Boards (CCBs) in every area, where groups of non-elected citizens would work towards the development and uplift of their areas. CCBs could also raise funds through voluntary contributions, and could also receive financial support from local governments. Although most CCBs were still non-existent, there were a few cases where, for example, they had set-up shelters for schools in a district.

The District Government structure was part of the controversial Legal Framework Ordinance (LFO) which was responsible for the complete disruption of elected Parliament for more than fifteen months after the October 2002 General Elections. Subsequently, parts of the LFO became incorporated, controversially, in the 17th Amendment to the Constitution of Pakistan under which the District Government system received partial and temporary indemnity. Since, as has been the tradition in the past, all military governments establish their own form of local government first before any democracy at the higher tiers is allowed—Ayub Khan's Basic Democracies, Zia ul-Haq's Local Bodies, Pervez Musharraf's District Government—quite often democratically elected governments at higher tiers make local government redundant.

On paper then, it seems that the District Government system set up by the Musharraf military government, seemed to have some new and innovative ideas. However, whether it actually worked, both in terms of devolving political power and allowing greater participation and accountability, and in terms of its ability to be more responsive to the community's needs in terms of the better provision of public services, is partially discussed in Section 12.3. The first year of the new system had considerable teething problems, and studies which looked at that period, not surprisingly, were critical. Even after some years, however, research was still lacking and there was need to examine the system in some detail. However, as has always been the case, electoral politics at the higher tiers—provincial and national—had once again hindered the evolution of the local government system in Pakistan, and any research and study which examines the performance of local government *qua* local government, cannot ignore this imposing reality. After the 2002 elections, elected members at the provincial level, as had been the care in the past began to come into conflict with members at the district level, undermining the latter's sovereignty.

12.2 Financing Local Government

One of the two most critical factors that have an effect on the functioning of any devolved system of government, is the one related to the *politics of power* at the local level, but also at the provincial and federal levels—particularly in a country like Pakistan, where the military dominates, issues that have been continually raised and elaborated upon in the context of the discussions that has taken place in earlier sections and in other chapters in this book. Linked to the politics of power, of course, is the financing of local government for, with service delivery the second cornerstone to devolution, one cannot have a fully functioning and efficient local government system unless financial issues around it are also investigated. We argue, that while local governments have had to deal with authoritarianism and other issues at the provincial and federal level, they have also had to contend with significant financial constraints which have an impact on the performance, and hence on the failure or success, of the functioning of local government. In this Section, we describe, highlight and analyse some of the financial issues related to local government that have a bearing on its performance.

Box 12.1

Women, Democracy, and Devolution

Afiya S. Zia and S. Akbar Zaidi examine the path of devolution and local government in Pakistan, and look at how large numbers of women were accommodated under General Musharraf's District Government system.

Each of the three—not including Gen Yahya Khan—military men who ruled Pakistan—each for around a decade or so, devised his own form of devolution and decentralization reflected in different systems and manifestations of local government. The pattern from 1958 has been repeated, where the earliest intervention of a military dictator has been to devise and implement his own preferred form of local government. Once the military man was no longer in power, and especially when he was replaced with a democratic dispensation of varying sorts, his model of local government was virtually the first component of the system to be dismantled.

The incumbent PPP government that came into power in 2008 took about two years to put to rest the devolution and local government system devised by Pakistan's most recent military dictator, Gen Pervez Musharraf.

Such interventions were primarily meant to make it easier for each of the three military generals to manipulate the political order to ensure his control over the political system, often by postponing the electoral and democratic process at a provincial and national level.

However, one cannot deny the fact that eight or 10 years of a particular form of social engineering is bound to have numerous consequences, some even positive. Zia ul-Haq's 1979 Local Governance Ordinance helped more than a dozen urban and rural elected leaders to acquire passage to the highest institutions of government in Pakistan. A former Pakistani president was a chairman in a district council before he was elevated to the highest civilian position in the country. Moreover, urban political parties emerged as key players in the assemblies through Zia ul-Haq's system of local government.

The main consequence of former Gen Musharraf's devolution system has undoubtedly been the extraordinary entrance of women as elected and nominated public representatives at the lowest tier of government. With 33 per cent reserved seats for women at all levels in the devolution system, 36,066 women councillors were elected and nominated in the first round of local government elections in 2001. With the size of the councils reduced in 2005, but still with the 33 per cent reserved seats for women, 24,528 women were elected to serve the public through the local government system. In a society considered 'tribal', backward, conservative and much worse, this entry of women as public representatives must stand out as the most important outcome of the devolution reforms undertaken in Pakistan.

While cynics always point out that women in Pakistan are largely tools in the hands of their menfolk, one cannot be oblivious to the impact the public presence of thousands of women had on their, and their communities', lives.

Despite numerous flaws—in particular the absence of fiscal decentralization—in Musharraf's local government system in the eight years in which it was in place, considerable social capital at the local level in the form of collective and participatory activities, such as the citizens community boards, musalihat anjumans and other such participatory forums, was created.

Previously existing institutions and social, political and—in particular—power relations, were all challenged, changed and affected. The irony cannot be lost that in many ways the devolution process by a military dictator may have actually helped democratise—through increased representation and participation—the political involvement of citizens.

There is not only the need to endorse the symbolic worth of local governance. The pragmatic aspects too must be seriously evaluated at this critical point. Practically all districts across all provinces (though not necessarily in equal measure) demonstrated a successful and organic process that gradually drew together developmental efforts on the part of councillors, NGOs, law-enforcement personnel, provincial representatives and the people.

Not always smooth and not without political leveraging, many indicators nevertheless show that these relationships have matured into what can only be assessed as a working citizenship. By this we refer to the meetings of local actors who attempted some mutual agreement at resolving conflict, implementing schemes and surviving or developing as a community.

There are also signs that indicate that working relationships were potentially becoming more democratised and replacing traditional ones that depended on biradari systems and forced marriages. Such emerging processes may be affected adversely if not recognized as an important social change associated with devolution over this last decade.

Ours is just one view on how the local government system functioned, and there are those who differ sharply. However, the problem is that while Musharraf's local government system has been thrown out, there has been no fair assessment of its functioning or achievements.

Donors, who were central in supporting the military dictator, especially his devolution plan, have not undertaken any meaningful assessment of the millions of dollars they poured into it. They now wait for a new system to emerge, which they will also support and pay for, and all this without accounting for all that has already been spent.

Clearly, before any new system of local government is devised, there needs to be an honest appraisal of the one that it will replace, rather than a simplistic or mechanical trade-off. Even if it was created by a military dictator, democratic governments can learn much from social relationships and delivery processes of these last two terms.

Moreover, in the past, whenever elected governments replaced the local government system inherited from military dictators, they chose to do away with elected local government altogether. We recognize that the present electoral and democratic dispensation in parliament may be far more representative and democratic in many important ways than such arrangements in the past. However, the true test of how far elected representatives are willing to go to bring about and deepen democracy will come when they actually hold elections at the local level and when elected representatives are in place at all three tiers of government.

Financing under the 1979 Local Government System[32]

The Federation of Pakistan continues to be governed by the Constitution of Pakistan of 1973 and all amendments in it since then, although it has been trampled upon and altered, and subjugated to the personal and political whims of the two military Generals who have held power since. The Constitution specifies the functions of the federal government and of the provincial governments. The federal government has exclusive responsibility for undertaking functions under the Federal Legislative List which is contained in the Fourth Schedule [Article 70(4)] of the 1973 Constitution—see Chapter 10 for more details.

Many of the Residual functions not part of either of the Legislative Lists which were supposed to be performed by the provincial governments had been delegated to the local governments by the promulgation of ordinances in the past, especially prior to Decentralization Plan 2000—see below. Of the functions allocated to local government in the past by the provincial governments, there were a set of *compulsory* functions which, especially urban councils, were expected to perform, in addition to an *optional* set of functions, which as the name suggests, may or may not have been performed by the local governments.

Under the old local government system and structure of the LGO 1979, the entire revenue of all local governments—rural and urban—formed a mere 5 per cent of revenue generated by the different tiers of government, with the federal government earning close to 89 per cent, and the remaining being generated by the provincial governments. Over time, the share of revenue generated by local governments had been rising, albeit marginally, while that of the provincial governments had fallen. The local governments had collectively, been able to show a better fiscal effort in terms of tax and non-tax revenue generation in the last ten years. Nevertheless, as a share of all revenues generated, the contribution of local governments was always very small.

As far as expenditure was concerned, local governments spent only about 4 per cent of the total expenditure of all forms of governments in the country, showing their relative unimportance in this regard. This relative amount fell over the last decade before the new system was put in place. As far as recurring expenditure was concerned, local governments spent a much larger share on establishment costs as ten per cent of all expenditure on general administration in the country used to be spent by local governments. Of the recurring expenditure on the social services in the country, provincial governments spent the largest share since education and health were provincial concerns. Local governments contributed ten per cent to the establishment costs of social services. Over time, the federal government shifted its contribution on the development side to the provincial and local governments, hence causing both to contribute more over the 1990s. Thus, in 1979–80, provincial governments were incurring a share in total development expenditure in the country of about 18 per cent; this rose to 29 per cent in 1985–86. Similarly, in the same period, local government increased its share from 3 per cent to about 6 per cent.

Since local governments came under the jurisdiction of provincial governments—they still do—their right to levy taxes was also subject to the directives of the latter. Local governments assist the provincial governments in the collection of revenue, and thus provincial governments had delegated the right of the collection of taxes to local governments as indicated in the Local Government Ordinance of 1979.

Local governments had been instructed to charge a local rate or local cess on all land assessable to either rent, land revenue, or ushr in their jurisdiction. The provincial government would determine the rate to be charged and could change it from time to time as it deemed fit. Local bodies were authorized by the provincial government to levy all or any of the taxes laid out in the Second Schedule of the LGO. All urban local governments on the direction of their provincial governments could levy the following taxes:

> Tax on the import of goods and animals in the jurisdiction of the Committee for consumption, use or sale therein; tax on the annual rental value of buildings and land; tax on cinemas and cinema tickets; entertainment tax on dramatical [sic.] and theatrical shows; tax on the transfer of immovable property; water rate; drainage rate; conservancy rate; tax on all kinds of vehicles; lighting rate; tax on the birth of children; fee for the erection and re-erection of buildings; marriage tax; fee for the licenses, sanctions and permits granted by the Committee; fees on the slaughter of animals; tax on professions, trade, callings and employment; market fees; tax on advertisements; tax on feasts when more than twenty persons, not belonging to the household of the persons arranging the feast, are entertained with foodstuffs; tax on animals and sale of animals; toll tax on roads, bridges and ferries maintained by the Committee; fees at fairs, agricultural shows, industrial exhibitions, tournaments and other public gatherings; fees for specific services rendered by a Committee; tax for the construction or maintenance of any work of public utility; parking fees; and any other tax which Government is empowered to levy by law.

Other than the taxes identified in the Second Schedule, provincial governments could direct any specific local council to levy any other tax; to reduce or increase any existing tax; and to suspend or abolish the levy of any existing tax. The provincial government had also given permission to the local councils and their Chairmen to make changes in the existing tax structure by drawing up specific taxation proposals. For urban councils, there was basically no variation in fiscal powers by municipal status. Also, for the most part, the taxes, rates, tolls, and fees that could be levied by Union Councils and District Councils, were very similar to those which could be levied by urban government.

The Local Government Ordinance prescribed the various sources of revenue which local governments had access to. As a whole, in urban areas taxes formed about 60 per cent of revenue, while the remainder accrued from non-tax sources.

The single largest source of revenue for urban councils was the octroi tax which accounted for in excess of 50 per cent of revenue. This was more significant for larger corporations, while the share fell as the size of the urban council decreased. This pattern was not unexpected, since this was based on goods being brought into council areas. In highly developed areas with a larger consumer base, and with areas producing industrial goods, more goods were imported and consumed, hence the higher share of the tax.

The property related taxes such, as the urban immovable property tax and the tax on the transfer of property, constituted the next largest source of revenue, and together constituted about ten per cent. Again, property related taxes yielded higher revenues in the larger cities such as metropolitan and municipal corporations. The smaller urban councils depended on non-tax receipts more than did the larger councils. Licenses, fees and other non-tax receipts constituted a far greater share in smaller towns/cities than in larger ones. The only tax levied by both urban and rural councils was the tax on transfer of property, which is levied at the time of sale on immovable property. The assessment was based on the total value of the property at the time of the transfer.

Financing under the 2001 Local Government System

The Local Government Ordinance (LGO) promulgated by provincial governments during August 2001, with amendments during 2002, assigned clear powers, responsibilities and service delivery functions to three levels of local governments: district, tehsil, and union. In effect, responsibilities for the delivery of social and human development services, such as primary and basic health, education and social welfare, now rests at the district level, whereas municipal services, such as water, sanitation and urban services, are to be delivered at the tehsil level.

The LGO 2001 made some bold changes into the earlier decentralized local government system with, perhaps, the biggest change and innovation with the case of fiscal decentralization. Fiscal decentralization requires provinces to devise transparent mechanisms to transfer revenues to local governments in the form of formula-driven block grants. Under the new system, local governments were to determine budgets and expenditures for most services, whereas only policy issues, guidelines and monitoring functions were to remain with provincial and federal governments. Higher levels of government were to provide additional, special purpose and conditional transfer to local governments as the primary means to encourage particular policy outcomes, such as poverty reduction interventions, local economic development and natural resource management.

Until the implementation of the Devolution Plan and the LGO 2001, as we show above, the system of budgeting was highly centralized and wrought with numerous serious problems. On paper at least, the new Devolution Plan made radical departures from the past. The new Plan, claimed that earlier the identification, appraisal and approval of development projects was highly centralized, with little community participation, inappropriate design and poor cost effectiveness. The new Plan tried to incorporate and address these weaknesses.

In theory, at least, the provincial departments were not supposed to determine the distribution of funds. For this purpose, a Provincial Finance Commission (PFC) was to be established by each province to develop fiscal transfer mechanisms and the formula for the distribution of funds. The Finance Commission was supposed to ensure the distribution of resources between the provincial and local governments out of the proceeds of the Provincial Consolidated Fund into a Provincial Retained Account and a Provincial Allocable Amount, which was then supposed to be distributed to the three tiers of local government in the provinces. The shares of each local government tier were to be provided on a monthly basis. The Provincial Allocable Amount and shares of the local governments were to be on the basis of monthly receipts of the government.

Each local government was expected to have a single fund, which would have included the funds received from the provincial governments, the transfer made according to the formula of the PFC, and own revenue generated by the local governments. The transfer was to take place directly from the provincial level to each local government. Since the octroi and *zila* tax, two of the most important local taxes had been done away with in the new scheme, 2.5 per cent of the General Sales Tax was to be provided to the local governments. In addition to the fiscal transfers from the provinces, the local governments had been authorised to levy a number of taxes, depending on the level and capacity of each tier of the local government structure. Local governments were given new statutory sources of revenue. They now had the independence to decide on the rates as well as the levies. Two new taxes, namely health and education taxes, had been given to the local councils—see Tables 12.1 and 12.2.

Under the new budgeting system, the *Nazim*, before the commencement of each financial year, was expected to present the budget for approval by the respective Council at each tier. The provincial governments were to inform the District Governments in March of each year, the total share including development and non-development share, expected to be available to each local government. Once they were informed of the share, each local government would need to develop its own budgets for development and non-development purposes. The development budget amount was to be the amount left over after budgeting for recurring costs and liabilities. The budget for running the Councils was to be a charged expenditure.

With regard to the non-development expenditure, which was to cater to the recurring costs of offices and service delivery, the concerned Finance and Budget official was responsible for preparing the non-development budget for the district government, which was to be prepared by function and by object. The district/city governments needed to allocate the non-establishment budget to various offices under them; the single budget now included the expenditure of the Council and development and non-development activities funded previously through the local fund.

The development budgets were to cater to the needs for new assets or for improving old ones at the local government

Table 12.1
Local Tax and Non-Tax Sources under District Governments, 2002

***Zila* Council**

1. Education tax
2. Health tax
3. Tax on vehicles other than motor vehicles
4. Any other tax authorized by the Government
5. Local rate on lands assessable to land revenue
6. Fees in respect of schools, colleges, and health facilities established or maintained by the district government
7. Fees for licences granted by the district government
8. Fees for specific services rendered by a district government
9. Collection charges for recovery of tax on behalf of the government
10. Toll on new roads, bridges, within the limits of a district, other than national and provincial highways and roads

Tehsil and Town Councils

1. Local tax on services
2. Tax on the transfer of immovable property
3. Property tax on annual rental value of buildings and lands
4. Fee on advertisement and billboards
5. Fee for fairs, agricultural shows, cattle fairs, industrial exhibitions, tournaments, and other public events
6. Fee for approval of building plans and erection and re-erection of buildings
7. Fee for licenses or permits and penalties or fines for violation of the licensing rules
8. Charges for execution and maintenance of works of public utility like lighting of public places, drainage, conservancy, and water supply
9. Fee on cinemas, dramatical, theatrical shows and tickets thereof, and other entertainment.
10. Collection charges for recovery of any tax on behalf of the Government, District Government, Union Administration or any statutory authority

Union Councils

1. Fees for licensing of professions and vocations
2. Fee on sale of animals in cattle markets
3. Market fees
4. Fees for certification of births, marriages, and deaths
5. Charges for specific services rendered by the union council
6. Rate for the remuneration of Village and Neighbourhood guards
7. Rate for the execution or maintenance of any work of public utility like lighting of public places, drainage, conservancy, and water supply

level. The new system envisaged that development funds would be available after deducting all liabilities and recurring costs. The Executive District Officer (EDO) for Finance and Planning at the local level was to be responsible for the consolidation and co-ordination of the development budget of the District Government. The Tehsil Officer for Planning was responsible for the consolidation of the development budget at the tehsil municipal level. Under the new system, a Citizen Community Board had been set up which was to play a crucial role in budgeting and planning at the district level. At least twenty-five per cent of the development funds were to be spent through these boards, while the remaining 75 per cent could be spent through the offices of the concerned local governments.

The military government proposed and began implementing the Devolution Plan 2000 in order to restructure the entire governance and development structure of the country, with the aim to empower citizens through their local governments. According to the new development planning system, every local government was required by law to undertake development within its own area. Projects were to be selected by all three levels of local government: Union Councils were required to play a pivotal role at the Union level where they identified and selected projects. The Tehsil Municipal Administration was to focus on municipal service projects like the sewerage system, drinking water, etc. while the district government focuses on social sector projects, like building schools and the provision of basic health.

The new system claimed a radical departure from the old, especially in terms of development planning, selection, and execution. While, as we argue above, in the old system, project identification and execution was managed by the federal and provincial governments. The change envisaged was that at the District/Tehsil/Union levels, project identification and selection was *supposed to be made through a collaborative and consultative process involving communities and citizens*. Table 12.3 shows how the new system of local government differed from the previous two.

Once a project had been identified, e.g. a school at the Union level, a women's college at the District level, or a Basic Health

Unit at the Union level, the project appraisal and approval was supposed to take place. Under the new Local Government Ordinance, the planning and development function had been decentralized to the local level. In the District Office a separate office had been created to look after the District functions, and was to perform broad economic and social planning functions at the District, and ensure that it carried out appraisals of the projects formulated by the District and submit these proposals for approval to the *Zila Nazim* and to the *Zila* Council. The Finance and Planning Group Office was required to furnish the working papers to the District consultative councils and boards and prepare a development perspective for the whole District. Once finalized by the District Government, the entire set of development projects would constitute the Annual Development Programme of the District and was to be approved by the *Zila* Council. Every Union *Nazim* was a part of the *Zila* Council and they knew which of their projects (or those of others) had been accepted or rejected. Along with the Annual Development Budget, the non-development budget was also sent to the *Zila* Council for approval. Once the *Zila* Council approved a project or the budget, then the Executive District Officer for Finance and Planning, communicated the approval to all concerned. Once finalized, the projects were ready for execution and the funds are available.

It takes some years for the amount of change required, particularly in the case of fiscal decentralization and financial reform with regard to local government, to make its presence felt. It is far easier to change the electoral college or the structure of governance systems, but fiscal issues, given the deep vested interests of all actors involved, take more time. Some studies, particularly by donors, made attempts to examine these changes. The ADB/DFID/WB multi-volume study, found some overall 'modestly optimistic trends', although still found most districts were 'hugely' dependent on transfers from higher tiers of government, and despite the budgetary provisions discussed above, found that local governments had limited autonomy in preparing their budgets. Moreover, the tax base of most District Governments remained weak and very limited, which did not allow them to raise substantial additional own-source revenues.[34]

It is important to state that ADB/DFID/WB study was an apolitical, technocratic, study which looked at managerial and fiscal issues, but specifically stayed away from political issues. This undermines the worth of any analysis, for the real issues, as we argue in this chapter, are always about *power* and are, therefore, *political*. Even fiscal issues are about power, control and politics. Time and again, we have seen that even the best designed technocratic solutions fall apart when they enter the real world of politics. Nevertheless, it is worth just highlighting the main observations from the ADB/DFID/WB study, since it did cover a large area, even though the entire framework of the study was technocratic and side-steps political issues—see Box 12.2.

The study found 'evidence of genuine change, particularly in the opportunities that citizens have gained to make their concerns heard', yet found 'the evidence of progress [in the practice of devolution] . . . scattered'. On financial control, clearly a *political* issue more than any other, the study identified problems which most people studying local government are familiar with, such as district officials having 'weak control over staff numbers', that they could not decide

Fiscal Issues under Musharraf's District Government System

If districts do raise additional revenues, then to date little attempt has been made to ensure horizontal (or vertical) harmonization of taxes among various governments. Imposition of a new tax by a local government, without any corresponding levy by other similar governments, can make mobile taxed resources move out of the taxed jurisdiction to other locations. This has clear implications for business and economic activity within the taxed jurisdiction. Inevitably, this discriminates against the more backward jurisdictions, where the revenue needs are the highest, but where, due lack of infrastructure and other amenities, economic activities are already limited. In distinction to tax equalization, which argues for equal tax rates across all jurisdictions, tax harmonization suggests that local tax structures should be consistent with the economic and social conditions of each jurisdiction. This also does not rule out the possibility of an efficient and productive tax competition among various local governments, whereby a local government can enhance taxes but prevent its impact on business and economic activity by providing better living and business environment through its expenditure decisions.

In their first year, local governments employed a variety of new revenue measures to meet their expenditure needs, with no consideration given to the viability, efficiency or sustainability of these measures. For example, a tehsil in Khairpur district, decided to use its development funds to establish public real estate, which could yield a future stream of rental income for the TMA. Not only does this run counter to the government's stated objective of withdrawing from areas of private sector expertise, the experiences of other countries point to grave risks in such a mode of revenue generation. After some Union Administrations resorted to collection of tolls (and the defunct zila tax), the federal government intervened to require that local governments get any new taxes that the plan to levy vetted by the provincial finance department. While this is important for tax harmonization and coordination and for prohibiting the local governments from thwarting national and provincial policies and objectives through imprudent taxes and other fiscal measures, it potentially undermines the independence or discretion of local governments.

Overall, districts are left with little incentive to raise additional taxes, and even less incentive to raise them well. Indeed, there are overwhelming political disincentives for nazims to levy taxes. They are primarily dependent on fiscal transfers, and under these circumstances subnational governments have few incentives either for cost efficiency or to improve efforts to raise revenues. Such imbalances can be mitigated by a combination of formula-driven predictability in the intergovernmental fiscal transfers, and autonomy for provincial governments in relation to setting the tax rate and the tax base for those revenues that are assigned to them. However, thus far, the effect of the formula based transfers has been limited, as in order to provide for a smooth transition, financing of recurrent expenditures has been determined according to the principle of 'revenue adequacy', that is, to maintain service delivery at pre-devolution levels.

The 'revenue adequacy' principle worked well to prevent large-scale disruptions in service delivery at the outset of the new system, but it has also preserved the disparities within provinces that are evident in the per capita budgets before the introduction of the interim PFC awards. This probably means that, for the nazim of good intentions, 'grantsmanship', the manipulation of expenditures in order to trigger greater transfers in the future, remains a better bet than tax effort for increasing district revenues. Still, it is intended that a reallocation will gradually reflect relative need and revenue potential. There are some changes in the size of fiscal transfers, but the implication is not yet clear.

Overall, newly-appointed district and tehsil nazims will be wary of raising additional taxes. The interim PFC awards in Sindh and the Punjab do seek to create some incentives for increased revenue generation. For instance, in Sindh, districts will be given an additional allocation matching their baseline collection of certain items. However, this may have the perverse effect of motivating districts to raise taxes regardless of how well they are spent. Districts with wider tax bases and lower efficiency may gain more than those with a narrow base and higher efficiency.

In addition, the incentives remain weak for encouraging user-fees for private goods. The community is willing to pay for improvements in the delivery of services that they value. In the case of water and sanitation, for example, devolving capital expenditures from the provincial level to the district or tehsil level, accompanied by good intentions to tie them to capacity for operations and maintenance, is unlikely to be sufficient to discipline investment. Without a relationship between quality and quantity of services delivered, on the one hand, with the cost of those services, on the other, infrastructure will suffer from under-investment and problems in operations and maintenance will continue.

salary budgets or dismiss surplus staff and nor could they recruit with a free hand. Importantly, the study found that 'neither district nor tehsil authorities have any autonomous power to determine pay policy'. Similarly, local officials 'must respond to program goals and priorities that they have no hand in defining', again, clearly highly political issues given Pakistan's highly centralized state. The ADB/DFID/WB study did, nevertheless, make numerous recommendations of a 'governance'/managerial/administrative nature which could improve the functioning of local government, *within limits*, but the broader issues of substantive change, as we argue below, are of a highly politicized and political nature.

12.3 Three Military Rulers and Three Local Government Systems

Research for this chapter was conducted four years after the then devolved and decentralized District Government system of General Musharraf's military regime had been in operation. At the time of research for this chapter, when local government elections were to be held in Pakistan in August/September 2005, for the second time after the promulgation of the 2001 Local Government Ordinance, not a day went by when the local press, both English and Urdu, was inundated with articles, stories, news reports, and letters which discussed either the system itself, or the ongoing electioneering campaign. There were serious analyses by scholars about the District Government system and structure as well as interviews of candidates and incumbent *Nazims*. The two themes that emerged in the discussion were based broadly on the politics related to the system and about the impact and performance of the sitting councils and their *Nazims* in terms of service delivery. In this section, we first, briefly, discuss developmental aspects of the devolution process, followed by the far more important political aspects, related to the state, participation and the military.

Given Pakistan's huge development deficit, its development 'problems' will not go away in years to come. There will always be a shortfall of targets and aspirations, the demand for services will always outstrip supply. Governments will continue to be criticized for not doing enough, and perhaps local governments more than any other tier, since the work—or lack of it—which they are supposed to do, is more visible. This makes assessment of the output/work of local government difficult, yet something that cannot be avoided. Clearly, for this reason it is not possible or fair, to make any comments on the service provision and performance of the local governments in Pakistan, especially given the fact that data may be hard to come by. However, one could make some general observations about how *one ought to* look at the performance and evaluation of local governments in Pakistan and outline future research needs.

Without a doubt, there is a need for greater monitoring and evaluation of local governments by citizens and research organizations outside of government. Perhaps some generic measure of 'best practices' needs to be drawn up against which one can assess the performance of other local governments. An institution (or long term research agenda) can monitor the performance of a selection of District Governments against a set of measurable criteria underlining achievement and failure and publicizing the results in the media, as a sort of local government watchdog. The absence of Citizens Community Boards (CCBs), a cornerstone to the District Government Plan, was a case in point. With very few CCBs existing, one already had a research and political angle to evaluating the performance of the local government system in place in Pakistan. However, such an effort would have required a group of citizens working with a research team at an institution, to follow this through. A key issue in the problems of local government has been the insufficient finances that local governments have available—as we argue above—and hence research needs should address solutions to this core problem. Another persistent problem in the quality of delivery of services from local government, was their lack of skills and training. Many District Governments did not have the capacity to do what they were expected to do, simply because they did not have the managerial or administrative capacity, areas where research could identify specific gaps. However, while these governance and financial issues are important, we feel that many of these problems had their roots in the larger politics of the land and how the state was run and how resources are controlled.

The *Dawn* newspaper from Karachi in its 1 August 2005 report, for example, gave a detailed report of a seminar held in Lahore in which technocrats, former *Nazims*, officials of the Musharraf government and a host of others, spoke.[35] The *Nazims* of Kohat in the NWFP and of Karachi, both of whom were members of political parties and groups which were not in power at the provincial level, stated that their local governments 'performed well during their first year [2001–02] in office, but started having problems after the induction of provincial governments'.[36] The Chairman of the National Reconstruction Bureau, a government think tank responsible for managing and developing the District Government system, defended the system and spoke about many of the new powers that *Nazims* had acquired through the new system, including some functions of the provincial government which had been devolved to the tier of local governments. Many of the other speakers criticized the system for its weaknesses, particularly because they felt that the provincial government had too much power over the District Governments and had ample room to interfere. Many speakers felt that the system had not really been devolved. However, from the newspaper report one gets the sense that despite the problems and criticism, there was grudging acceptance of the local government system as it then existed in practice.

In the same issue of the newspaper while there were numerous reports about the ongoing election campaign, there was also a detailed analytical article by one of Pakistan's more prominent civil society democrats who also heads the Human Rights Commission of Pakistan. The key argument that I. A. Rehman made, was that the four provincial ministers were trying to make the local governments their 'fiefdoms' and ensure that their candidates were elected. He wrote that the 'chief ministers . . . are working overtime to ensure that local government elections are won by their protégés and favourites, as if their future in office depends on this. (They may well be right)'.[37] He argued, that it was the 'central authorities' who had 'willed that the local bodies should, instead of empowering the people, become fiefdoms of the provincial chief ministers'. Rehman's article discussed the numerous amendments which had been made in the LGO 2001 for the current round of elections. He showed, for example, that further powers had been given to the provincial chief ministers to dismiss elected *Nazims*, and how the *Nazim's* powers had been curtailed through these amendments. Despite these changes, Rehman accepted that the reasons that 'the grant of unbridled powers to chief ministers over the

life and death of *Nazims* has not dampened the enthusiasm of candidates for such offices is easy to understand. If all that a *Nazim* is required to do is to keep the boss in the provincial capital happy, the office becomes more attractive, not less'.[38] One gets the feeling, that we have been here before.

The general perception in Pakistan in 2005, was that the much touted Devolution Plan of the military government was in the state of a near crisis. After the elections of the National and Provincial Assemblies, as has happened so many times in the past, the local government system imposed by the military, continued to be questioned by the elected members of the higher tiers of government. These elected Provincial and National Assembly members felt that the system of District Government had taken away some of their control and privileges and so they felt threatened. Hence, as in the past, a contradiction between the politics of democracy—even a praetorian democracy—and the politics of the military re-emerged. To make matters worse and to undermine the local government system established by the military government, elected representatives at the National Assembly level had all been promised large sums of money for developmental purposes which they were supposed to spend in their constituency, throwing into peril the carefully crafted local government fiscal and development model. Even donors, otherwise the most vociferous supporters of Musharraf and all his policies, particularly that of devolution, conceded that 'the opportunism of national and provincial assembly politics has resulted in further competition between MPAs [Members of the Provincial Assembly] and local councillors for control over assets through which they can manage their constituency relations'.[39]

Lest it be misunderstood that these examples are either infrequent or very recent, related only to the electioneering phase and the public debate, some examples from the past will only help highlight some of the many issues that exist around the process and system of local government in Pakistan. In March 2004, the International Crisis Group (ICG) launched its *Devolution in Pakistan* Report and stated:

> While the ostensible aim of Musharraf's devolution scheme may be the transfer of administrative, political and financial authority to the lowers tiers of government, the reality is starkly different. Local governments in fact exercise only nominal autonomy with respect to administrative and financial matters in their respective jurisdictions.[40]

The Report adds, that:

> 'Local governments have proved to be the key instruments in the military's manipulation of the Pakistani polity to ensure regime survival. District nazims used public funds and other state resources to stage pro-Musharraf rallies during the April 2002 presidential referendum and to support the Pakistan Muslim League (Quiaid-e-Azam) parliamentary candidates in the 2002 national polls. Local governments have also had significant utility for the military's divide-and-rule tactics. By juxtaposing more than 100 new local governments between it and the provinces, the centre, where the military continues to maintain its grip on the levers of state power, has been strengthened at the cost of Pakistan's four federating units.
>
> 'If Pakistan's chequered political history is any barometer, the question of devolution cannot be addressed in isolation from the larger issue of provincial autonomy . . . Pakistan's civil-military ruling elite . . . has often used the administrative and coercive powers at its disposal to extend the centre's control over the provinces. Since military-inspired devolution is directed to local levels, it enhances tensions between the centre and the provinces.'[41]

The ICG Report believed that 'the military's political engineering that accompanies it [local government reform] is widening divisions at the local and provincial levels. Some of these could well lead to greater domestic violence and instability'.[42] Clearly, in terms of the politics of local government reform under the military, we see that the story in Pakistan was repeated for the third time under its third military coup maker which created Pakistan's third devolved and decentralized local government system. History, it seems, had repeated itself, not just the first time as tragedy, but the second time, as farce. Both the previous local government systems which were seen to be the cornerstone of both military governments, even after being in place for a decade or so, fell apart with the fall of the regime with which they were so closely associated.

A second round of elections for the District Government were held and numerous innovations were made in the second tenure of these governments between 2005–09. However, with the fall of the Musharraf regime and with the end of the tenure of the elected District Governments, the People's Party government and its allies, decided to do away with the Musharraf model of decentralization and devolution, and even after five years of being in power, were unwilling to propose a structure or model which would replace the previous system. Clearly, history did repeat itself, once again.

Moreover, what is interesting and instructive, is to compare the role which local government played in 2005 when the earthquake struck Pakistan and when elected local governments existed, compared to 2010 and 2011, when floods hit Pakistan in the absence of elected local government. While there are some problems in making a direct comparison between the floods and the earthquake, the absence of elected local governments at the time of the floods made relief and rehabilitation difficult. In the 2005 earthquake relief and rehabilitation process, elected local government officials played a critical role.

Also worth pointing out is, that after the 18th Amendment to the Constitution when many powers from the federal government had been devolved to the provincial government, as it ought to have happened, local government responsibilities and decisions about the nature of local government, such as what type of system they want or when elections are to be held, are now the responsibility only of the provincial government. A failure of local government and the inability

to hold elections at the local government level is clearly a failure of the four provincial governments. One cannot hold the federal government responsible for delaying elections at the local government level any longer—see Appendix 12.1 for a post-Musharraf evaluation of his district government system.

12.4 Is Local Government the Answer?[43]

12.4.1 The Contribution of Municipal Government in Development

The overall analysis of municipal, i.e. urban, local governments regarding the provision of services in the old system prior to 2000, suggests a number of conclusions. Firstly, almost all councils in the larger urban centres more or less restricted their role exclusively to the performance of some (or all) compulsory functions. In smaller towns and cities, the financial and institutional capabilities of the councils restricted even the performance of compulsory functions, leave alone those of an optional nature as well. In these cases, the provincial government intervened to help these governments make ends meet—both financially and technically. In larger cities, water and sewerage authorities and development agencies played a critical ancillary role to the municipal governments. Without this assistance, it is unlikely that local governments, even in big cities, could have managed. Some of the optional functions of these governments were also performed by such specialized agencies.[44]

Even though education and health were the primary responsibility of the provincial governments, both sectors continued to play an extremely important role in the provision of services in cities. In larger cities, the provincial government played a minimal role, as a large number of schools and medical facilities were either private or had been developed, administered, and financed by the local municipal government. However, even large cities such as Peshawar (pop. 1.5 million), lacked the capability to run and develop their own schools, hospitals, and dispensaries.[45] In smaller towns, the provincial governments played a formidable role, not only in education and health, but in almost all other sectors as well. The reason for this is clear, that smaller urban centres lacked technical and administrative capabilities and did not have adequate staff to undertake substantial development works. In many cases, large schemes (water supply, sanitation, drainage) which can only be undertaken by the provincial department in the case of smaller towns and cities were, after completion, handed over to the local council. The local council was then responsible for operation and maintenance costs, which many were unable to meet.[46]

Essentially, then, local municipal governments, given the structure at that time, especially that which came with a smaller size, did not have the capability to provide essential services which could have had positive effects on development in terms of water supply, drainage and sanitation, primary education, and hospitals and dispensaries. While many governments lacked technical capabilities, financial constraints were even more severe.

A very large share of municipal government expenditure was recurring expenditure, a trend which was more pronounced in large cities. This expenditure went towards maintaining and operating water supply schemes, public health, education, and curative care. The highest per capita expenditure in the urban councils of the two biggest provinces, Sindh and Punjab, was incurred on roads. In Balochistan and the NWFP it was on drainage. In urban areas in the country, the high-priority sectors for development were water supply, sewerage and drainage, and roads, collectively accounting for 50 per cent of development expenditure.[47]

The picture regarding development provided and undertaken by municipal governments in the past, is therefore particularly dismal. Urban local governments, with the possible exception of the larger metropolitan corporations in Karachi and Lahore, along with a handful of the bigger cities, did not provide either services or facilities which would have a positive developmental effect. As we have argued in much of this chapter, while there has been some change in design and structure under the new district government scheme, the *generic* problems remain the same as those in the past.

12.4.2 Potential for Development by Local Governments

Urban local governments were specified a large and varied number of tasks and functions which they had to perform, and some which they may themselves have chosen to perform. The scope of the statutes regarding the provision of services and facilities was broad enough to encourage major projects in the social sector which could have benefitted underprivileged and vulnerable groups, especially women and children. Almost all major areas were covered in the statutes and very few more could have been added. Technically, provincial governments could delegate further responsibilities to the local governments as they deem fit.

The problem, then, was not one of statutory limitations, but financial and technical, and possibly conceptual and motivational, constraints to developing facilities affecting social welfare for the general public. There is a clear relationship with size of city as far as the possibilities are concerned. The larger cities (or, as we argue now, the larger, richer districts) are usually in a position to raise funds and provide facilities and services for their population. Smaller towns, cities and districts just do not have the resources—of any kind—to provide other than the very basic facilities, such as roads and drainage. To expect anything else would be very unrealistic. However, even the relatively large Peshawar Municipal Corporation in the past, spent as much as 86 per cent of its budget on salaries and on electricity bills.[48] While Lahore Metropolitan Corporation did have a large number of health and medical facilities, it spent in all less than one-half of a per cent on health care, or ten paisa per inhabitant.[49] Thus, while the larger corporations did have access to more funds, their budgets, too, were quite small. The low fiscal outlay of the Municipal Councils necessarily made the salary and administrative costs look excessive. Thus, where revenue

and expenditure were limited, as was the case in almost all councils, the costs of administration remained high, and will continue to be so, until the time when the municipal revenue base is restructured and substantially enhanced.

While financial constraints were the biggest hindrance to the provision of services and facilities in cities, there were some others as well. In the larger cities, the establishment of development authorities and of specialized organizations like the water and sanitation agencies under the provincial government played an important role in delivering services.[50] In small cities, the provision of local infrastructure was usually carried out by provincial line departments, in particular the Public Health and Engineering Department, in the case of water supply and sanitation. This meant that local bodies had been left in the role of having to provide for solid waste management, cleansing services, drains, etc. This implied that while services and facilities were provided to the inhabitants, local governments had their role further marginalized. It was relegated to that of operating and maintaining services which were developed and created by other agencies, a role that they were reluctant to play as they felt they were not involved in the planning and implementation process at an earlier stage. Furthermore, the link between service provision and local taxation had been weakened, and hence local government resource provision had been less than its potential.

The provision of services and facilities by other agencies had meant that local governments were not willing or eager to develop their own organizational and technical capability. It has been seen that many communities are willing to pay local taxes and user charges if they feel that adequate services will be delivered. However, local bodies will have little incentive to generate additional sources of income if they are not in a position or under compulsion to provide municipal services because such provision is under the control of other agencies. Thus, on the one hand, while specialist agencies did provide facilities, their presence undermined the role that local governments should have played.[51]

An overview of municipal local government reveals that even basic services and facilities were not provided by local governments because they did not have the funds to do so. Furthermore, even if there was expenditure on sanitation, water, etc. there was no guarantee that the projects envisaged by local governments would deliver to the more needy segment of the population. In most cities, it is the well-to-do who have access to better facilities. Poorer neighbourhoods, often on unregularized lands, where the most vulnerable and underprivileged people live, do not have access to the most basic of facilities. The population which needs facilities most for its development is often neglected the most by all tiers of government.

12.4.3 Is Local Government the Answer?

While there has recently been growing lip-service paid to the role that local governments in any guise, including that of the district governments, are expected to play in development, it seems quite clear that the existing structure of government in Pakistan does still not permit any meaningful role to this important tier in the hierarchy. Local government with the exception of a few large city district governments has been reduced to an institution that pays recurring costs incurred by schemes often developed by other levels of government. Furthermore, most, if not all, local governments face severe financial constraints and are not even in a position to pay the salaries of their employees.

In the early 1980s, local governments seemed set to play a productive role in development, but ironically, the return to democracy at the national and provincial levels helped to subvert that possibility. Today, local government in Pakistan is the least likely, given existing administrative and financial structures, to be able to play any positive role in development. Unless substantial steps are taken to redefine the context and nature of local development, local government will continue to be ineffective.

Even under General Pervez Musharraf's Devolution Plan under which District Governments had been created and put in place, the basic *contradiction* between higher tiers—particularly provincial—emerged again. See Box 12.3 on the problems with local government.

It would also be fair to say that local governments are not solely responsible for the dire straits they are in. Unless provincial and national governments practise better governance at all levels of the hierarchical structure, the status quo is unlikely to be changed. Local governments are ineffective not so much due to their own faults, but due to the way they have been treated by the higher echelons of government. For local governments to work more effectively, higher tiers of government must have more confidence in them and must relinquish effective control. Any meaningful desire for devolution and decentralization must incorporate the practice of devolving power and resources from the federal level to the provincial first, before an effective local government under the provincial government can work productively. After the 18th Amendment, the onus is on the provincial governments to develop their own local governments.[52]

12.5 Summary and Further Reading

12.5.1 Summary

This chapter explores broadly the decentralization and devolution debate and experience in Pakistan in a political economy framework and context, with emphasis on contextualizing power and examining issues of devolution and decentralization within a wider framework and context of state-society relations. The main contribution of this chapter is that it follows a political economy approach and framework which requires a broader, more holistic view, and distances itself from a purely administrative/managerial/governance related evaluation, which have become the norm for international donor organizations.

There have been three substantive interventions in the decentralization and devolution process and structure in Pakistan since 1947, manifest through different administrative structures of local government. All the three attempts at local government reform in the form of decentralization and

Appendix 12.1

Democracy, Military Rule, and Local Government

This selection of articles from various issues of the *The News on Sunday*, over the last few years after the fall of the Musharraf regime and after the rehabilitation of democracy in Pakistan in 2008, highlights many of the issues which emerged with regard to the local government system imposed by the fourth military government. It shows how there was wide disagreement on whether the system should be done away with or whether it should be replaced by that of another military dictator. By September 2013, there were no elected local governments in Pakistan and there was little agreement in the four provinces about which system suited them.

I.

Sikander Ali Hullio writes:

The dream project of military regimes—in the name of ensuring real democracy and empowering grassroots communities, the three-tier local government structure in Pakistan, is once again in hot waters and courting controversy in the wake of equal demands being made either for drastic amendments or a complete repealing by major political forces that emerged out of the general elections held early this year.

Midwifed with much fanfare respectively by General Ayub, Zia ul-Haq, and Pervez Musharraf, this pet project of successive dictatorial regimes has never been fully owned as envisioned by the major political forces in the country over the past five decades, except partial ownership in the seventies and late eighties. It merely outlined an agenda to implement under the title, New Social Contract by Benazir Bhutto, in early nineties.

The existing three-tier local governance was born out of the much talked about seven-point reforms agenda announced by Pervez Musharraf after his Oct. 1999 takeover of power. It was formally launched on 14 August 2001, after selective countrywide consultations and deliberations made by the National Reconstruction Bureau (NRB), created for the reconstruction of institutions, then headed by Lt Gen (r) Tanvir Naqvi who is widely believed to be the father of the existing system.

Later, Daniyal Aziz effectively managed the reforms agenda, but it started to lose strength with the weakening of the Musharraf regime early last year.

Instead of piloting in some districts, as initially suggested to General Naqvi at that time by a panel of top governance consultants working with the NRB, the local governance system was launched uniformly across the country on non-party basis for a four-year term, having 23 members in every Union Council, which subsequently formed Tehsil and District councils. In its first tenure (2001–2005), the total strength of elected members was around 140,000, which was reduced to nearly 80,000 in the second tenure (2005–2009) as the number of councilors was slashed from 23 to 13 due to over-representation.

Currently operational in 117 districts including 4 City Districts, 358 Tehsils, 62 Towns in City Districts, and 6,139 Union Councils, the legal basis for local governments is laid through two constitutional provisions under Articles 32 and 140-A of the Constitution. Moreover, the system is run through Local Government Ordinances which were promulgated by provincial governments respectively on 14 August 2001. The Ordinances have been included in the Sixth Schedule of the 1973 Constitution for a period of six years. These ordinances can only be amended with the previous sanction of the President after consultations with the Prime Minister in accordance with the provisions of Article 268(2) of the Constitution.

In contrast to the originally envisaged plan, the autonomous face of the district governments started dithering and was defaced thanks to drastic amendments in 2005 where, besides several structural changes, the power to dismiss and suspend was given into the hands of the chief ministers instead of the councils that served as their electoral college.

Resultantly, sandwiched between the original NRB plan and the reasserted authority of the chief ministers, the autonomy of district governments was compromised in the 2005 amendments. This whetted the appetite of the conservative for power accumulation at the provincial level. This appetite is going to destroy the very essence of the system, leaving it at the mercy of the provincial governments which are going to take over as temporarily the constitutional protection lapses next August with the completion of four years second tenure of local governance in Pakistan.

Another major structural change introduced last month is the revival of the abolished structure of Divisions. Upon abolition, there were twenty-six divisions in country, five in Sindh, six in Balochistan, seven in North-West Frontier Province, and eight in Punjab. Seven years ago, the widely believed sun which set on the 19th century colonial style of governance with the introduction of devolution plan and abolishing of the archaic system of commissioners including deputy and additional ones, is going to rise again in the country. In Punjab, the commissioners have been restored after amending the Land Revenue Act, 1967, instead of the widely expected Local Government Ordinance 2001.

Since its introduction seven years ago, several hurdles have hampered the smooth functioning of this system. Blue-eyed bureaucracy emerged on the top, in a bid to have an upper hand in terms of authority over the elected representatives. Academically, in a paternalistic elitist approach, which is based on the notion that people are not equipped to know best what is good for them, bureaucracy has always been ditching such efforts at empowering the people. This gave birth to rampant transfers and postings of officers across the country, leading to misperceptions about the local governance and its very implementation.

Politically, the system was orphaned due to its essentially non-political nature and application. The major political parties landed their B-teams of close relatives in a bid to counter and contest the elections dominated by the pro-Musharaf forces. Besides, indirect election at District and Tehsil/Town level lowered the chances of emergence of in-house leadership, as in most cases a person with big political contacts and financial resources

landed important tiers. A direct election for the top slots would have worked better in terms of efficacy and ownership.

The Union Council, a grassroots organ of the local government, has suffered neglect, although it provides key Electoral College to both upper tiers, Union Nazim (District Council) and Union Niab Nazim (Tehsil/Town Council). The entry and issuance of birth and death certificates were its prominent jobs, while skipping the assistance and supervision of District and Tehsil/Town functions and activities were undertaken at the Union level through Union Monitoring Committees. Most of the functions, sanitation, sewerage, which are being looked after at the upper level, should have been decentralized at the Union level. Moreover, it should have been given more financial autonomy.

The system envisages broad but loose monitoring mechanism through the formation of Monitoring Committees of elected members to assist and oversee each devolved department, which mostly remained intact for the sake of operational requirements but remained ineffective and reduntant. This produced a poor auditing system, leaving room for massive corruption as alleged and unearthed in the case of the TMAs auditing conducted by the Government of Punjab last month.

Moreover, several institutional mechanisms remained either in papers or were a remote possibility during the process, which could have played a highly effective role in institutionalising the system. The formation and activation of Local Government Commissions in each province, including the activation of Mohtasib (Ombudsman) office in each district, could oversee, integrate and orchestrate the local goverment functioning effectively. Similarly, Musalihat Anjumans for the conflict resolution would also have worked better if formed and activated across the country.

In contrast, the citizens' participation and engagements through Citizen Community Boards (CCBs) have reportedly shown impressive results wherever formed and activated as per the local needs.

Largely, the critics of this system have said that the devolution of power makes the district police and the civil administration subservient to the elected local councils but the plan could not touch Pakistan's social and cultural peculiarities. With the installation of the local governments, the partial power was devolved to the locally elected representatives including decentralization of administrative and financial authority to local governments and the rest was robbed off during the process, which means that the less turned into reality and still much needed to be transformed, if genuinely the system is pushed ahead with a wider ownership in times to come.

II.

Adnan Adil argues:

Keeping the tradition of undoing things implemented by its predecessors, the government has allowed the 2001 local government system to expire on 31 December 2009, and according to news reports the provincial governments are set to revive the 1979 local bodies with municipal corporations in urban areas and district councils in rural areas.

Instead of making amendments in the present system to increase its accountability and service delivery, the provincial governments seem to have chosen a setup that could work as a mere appendage to the provincial authority thus depriving the common people whatever little representation and participation they had got in 2001.

To put the whole issue in perspective we take up the relevant questions one by one:

How do the local bodies work in Pakistan?
Legally speaking, local governments are an administrative arrangement of the provincial governments as they lack constitutional cover. Constitution recognizes only two tiers of governance—provincial and federal with chapters on them but there is no chapter on local governments. However, in principle, the retention of local government system is necessary to meet the requirements of Article 37(i) of the constitution, that is; state's obligation to decentralize the administration.

Lack of constitutional protection for these institutions has led to the frequent disruption of the local bodies and gave the provincial governments leeway not to hold local body elections regularly. For example, the Pakistan People's Party (PPP) governments never held local body elections in its two previous tenures in the 1970–77 and 1993–96.

Political significance of the local governments
In Pakistan, local governments, besides trade and student unions, have been the nurseries for grooming political cadre and provided the middle class people an opportunity to participate in the political process.

Representatives initially elected to the local councils rose to the national and provincial assemblies. Ayub Khan's much-maligned basic democracy system threw up on the national scene politicians that filled the rank and file of the Pakistan People's Party. Gen Zia ul-Haq's local bodies raised another generation of politicians which today makes up the most of both factions of the Pakistan Muslim League. Prime Minister Yousaf Raza Gilani himself is a product of the local body system.

For the middle classes, the local government system is the only avenue to participate in governance as the national politics is dominated either by the traditional landlord gentry or lately the moneyed urban class. A middle class person cannot think of applying for a major political party's ticket for a national or provincial assembly seat, let alone bear the election expenses. Owing to wider participation, people's participation in the past local elections has been very high as compared to the national and provincial elections.

How was the 2001 system different from the 1979 order?
The 2001 local government system was quite radical as it broke the 150-year long stranglehold of bureaucracy on the country's power system. For the first time, it brought the police and the administration, though partly, under local governance. District governments were entrusted powers to deal with 13 subjects on the provincial list, which meant that people in a far flung district did not need to travel to the provincial capitals for issues related to say education,

health, etc. The local governments became a governance unit instead of a municipal administrative unit of the provincial government as had been the practice in the past.

The 2001 system gave to the common citizen at the grassroots, particularly marginalized groups such as women, minorities, and labour, increased representation and a share in public affairs and it provided women a very direct stake in local governance.

Tehsil municipal administration, previously limited to urban areas, was extended to rural areas as a result of which the rural population started benefiting from municipal facilities, including water supply, streetlights, etc. Under the 2001 system, a local service was created in the districts while earlier most officials in the district government used to come from the provincial cadre or superior services.

Was the 2001 system fully implemented?
No. As bureaucracy and police loathed subservience to the elected representatives, the bureaucracy resisted its implementation from day one. It did not allow the system to be fully implemented. Neither village councils, nor citizen boards and police committees were formed. Central and provincial public safety commissions were not formed to oversee the functioning of police for a long time, and when the institutions belatedly came into existence, they did not function. In 2005, the provincial governments made amendments in the 2001 system to reduce the powers of local mayors and bring them under their control.

A major dishonesty was committed by retaining the huge supervisory bureaucratic structure at the provincial level when the same functions were devolved to the districts in at least 13 departments. As a result, additional government officials were recruited in the districts side by side with the provincial cadre. Instead of making the administration lean, the 2001 system was made to create additional bureaucracy and burden the national kitty. The dual control of 13 departments by the provincial and the local governments cost billions of rupees to the taxpayers.

Why opposition to the 2001 system?
The leadership of political parties, bureaucracy, and nationalists in smaller provinces are three sworn enemies of the local governments. The powers exercised by the local representatives cut through the powers and political influence of the bureaucracy and the members of the national and provincial assemblies.

The opponents of the local governments present the kind of arguments that were put forth by the colonialists opposing the transfer of power to colonies, that is; the local people are incapable of managing the system. This is the kind of argument that proponents of the strong centre use in opposing greater provincial autonomy, and in turn the nationalist parties seeking provincial autonomy use to oppose the devolution of power to the districts.

In fact, provincial elected governments prefer dealing with public servants rather than elected representatives because public servants can be transferred, while an elected district nazim can only be removed through a vote of no-confidence, which may not always be possible. The authority of the local governments in managing 13 provincial subjects is loathed by MPs as they think they want to (mis)use this authority to perpetuate their influence at the local level.

The bureaucracy had never accepted the 2001 local government system that had taken away powers enjoyed by the bureaucrats earlier. It demolished the epitome of bureaucratic power, the office of the deputy commissioner, which in popular parlance used to be known as 'king of the district' (*zila ka badshah*). Above all, the District Management Group and the police loathed subservience to local elected people, whether they come from local governments or provincial or national.

Political parties and the bureaucracy cloak their vested interests under the arguments that local governments led to massive corruption and bad law and order management. The fact is poor law and order is incorrectly cited as a failure of the local governments because they had little control over police. Law and order remained a provincial matter and district *nazims* only had minimal powers to oversee police performance.

Was there any flaw in the 2001 system?
As resistance to devolution started from day one, the authority was not fully decentralized to the district and tehsil level. A hotchpotch was made by delegating some authority to districts in 13 provincial subjects while retaining the provincial control at the same time. In effect, control of the local government system was at the district level but it was made dependent on the service, cadre and implementation machinery of the provincial government.

Under the 2001 system, local councils did not have any development funds, because they had minimal direct taxation powers. When the principal source for local government funding, the octroi tax, was given to the federal government in the form of the general sales tax (GST), their income sources were restricted to municipal corporations' assets in bigger cities. It is estimated that 80 per cent of the amount that local councils got from the federal government on account of GST collection was spent on salaries and overheads.

A major negative impact of the 2001 system was that it consolidated the hold of big landlords at the local level. In the absence of land reforms, the authority delegated to the district governments came into the hands of politically influential landlords at the district level. As the election of mayors (district nazims and tehsil nazims) was indirectly made by the directly elected representatives at the Union Council level, the feudal elements prevailed. Thus, the 2001 system strengthened local elites at the expense of national political parties. Moreover, industrialists and landlords got elected from seats reserved for workers and peasants. Women lacked authority despite increased participation.

Despite these flaws, the 2001 system transferred authority, though partly, from bureaucracy to the elected people, increased the participation of the disadvantaged groups and created a capacity at the local level to run the administration. This was a step towards decentralization and devolution, laying a foundation on which further improvements could be made.

What does the 2001 system rollback imply?
The provincial governments are yet to make legislation on the new local system. However, reports suggest that while the local councils will remain, their nature will change and they are likely to become a municipal administrative unit to exercise municipal functions at best. The abolition of the 2001 system means the supervisory role granted to districts in 13 departments will be abolished or reduced to make it minimal or just ceremonial. In other words, the local councils will be reduced to sanitation-related work alone and there would be no political or governance aspect to them.

News reports suggest under the revised system the provincial governments are relying more on bureaucracy. They have already restored the divisional tier of the administration that was scrapped in 2001 and the reinstatement of deputy commissioners and district magistrates is also on the cards. Thus, the separation of power of the judiciary from the executive achieved after a three-decade struggle would be reversed.

The 2001 local government system entailed massive amendments in dozens of laws governing the administration. Significant changes were made in the 1861 Police Act to incorporate district mayors' supervision of police though they did not have effective powers on police. To roll back the entire system, changes will be required in dozens of laws which involve district *nazims*. These wholesale amendments in laws, especially Police Order 2002 and the CRPC, etc. will require coordinated efforts by the provincial governments and the federal government as many laws fall in the purview of the federation.

As local cadre of services was created at the district level to run the administration of 13 devolved departments, this may be abolished. If it is retained to avoid political backlash, an additional bureaucracy will burden the local bodies having meagre resources. One option could be that the local government employees are merged into the provincial cadre. In most likelihood, the bureaucracy will make the government pull back all the devolved authority at the provincial level but retain the existing posts at the local and provincial levels as they provide larger scope of promotions and career opportunities. Bureaucracy wins all!

III.

Aoun Sahi makes the following arguments:

Many mainstream political parties—including PML-N, ANP, and some quarters of PPP (provincial governments of both Sindh and Balochistan)—are pressing to bring about changes in the local government system introduced by General Pervez Musharraf in 2001 through the Local Government Ordinance (LGO). Punjab government headed by PML-N is the first to show reservation for the local government system. It proposes the suspension of the system and appointment of non-political administrators in place of tehsil and district *nazims*.

But it seems the federal government is still not clear about the future of the system: President Asif Ali Zardari is waiting to be advised by Prime Minister Yusuf Raza Gilani and also for a report from the Ministry of Law before he makes the final decision. Reportedly, on 19 July 2009, the PM advised the president to allow the provinces to amend the Local Government (LG) laws, hence permitting them to dissolve the system and appoint administrators in place of district *nazims* until fresh LG elections.

It must be pointed out here that the local government system is protected under the Sixth Schedule of the Constitution until December 2009. The tenure of the present local government will expire on 17 October 2009. The power to take a decision on the LG will automatically go to the provinces on 1 January 2010, that will be free to amend the system in accordance with their choices, without the federal government's approval. But provincial governments are not willing to let this system function for the next four months.

Punjab Law Minister Rana Sanaullah tells TNS that there is a consensus among the four provinces over the fate of the LG—'The provinces have agree to appoint administrators in place of *nazims*. They also agree that the next LG elections will be held within a year.'

According to him, the local government system, introduced by a dictator, has become a symbol of corruption and political nepotism. 'The current shape of the system is not practicable and requires drastic amendments. In fact, we want to benefit from the 1979 local bodies system,' he says. Meanwhile, the Ministry of Law has promised to send the recommendations of the provinces to the president before 7 August 2009—'so that the provinces can make amendments in their respective laws before 14 August (i.e. to dissolve the LG and appoint administrators). For the time being there is no progress on the issue,' he confirms.

On the contrary, Muhammad Afzal Sindhu, Minister of State for Law and Justice, says: 'No time frame has been given for the submission of the report to the president. The ministry is yet to decide on the appointment of the administrators to replace the *nazims*. All provinces are onboard, but it is yet to be decided what will be the future course of action,' he tells TNS.

However, district *nazims* and local governments' representatives have adopted a different stance. The focal person of the Association of District *Nazims* in Punjab, Major (retired) Tahir Sadiq, says the democratically elected government's decision to bulldoze a representative institution with a massive public mandate justified the acts of military dictators in the past. We see no difference between what happened on 12 October 1999 and now. Abolishment of LG will weaken the federation. The demands of new provinces will become justified. They should empower the LG representatives instead of sacking them in a dictatorial manner.

He further says that section 140(A) of the constitution clearly states that power can only be transferred to the elected institutions. 'Punjab government has already approved a budget of Rs. 84.5 million for new commissioners and other bureaucrats who will be replacing the district nazims.' He adds that both PPP and PML-N had agreed under Article 10 of the Charter of Democracy that the local government would be autonomous.

He states that for the past two years the Punjab government has been accusing the local government of corruption but has not been able to prove it—not even against a single *nazim*. 'There are some reservations about audit reports in some districts but this does not make the whole system corrupt,' he says.

Some PPP sources disclose that President Asif Zardari is not in favour of the appointment of non-political administrators; instead he awaits the schedule for the next local government elections. 'PPP will not favour the appointment of non-political administrators for at least another year.'

In Sindh, however, the MQM is strongly resisting the move and has challenged Chief Minister Qaim Ali Shah's order to ban the sale, purchase, and lease of land by the district government of Karachi. The issue remains unresolved despite a series of meetings by a recently-constituted committee comprising members of PPP and MQM.

MQM's reluctance to endorse the abolition of the existing system of local governance has made it difficult for the PPP's Sindh leadership to implement the proposed appointment of administrators, says Haider Abbas Rizvi, MQM MNA.

According to him, there are many who accuse the local government of corruption and nepotism. 'But MQM has delivered while remaining within the system. Karachi's nazim was declared the top three mayors of the world.'

He does not believe that MQM is favouring the system because it will help the party to strengthen its hold in Karachi. 'We have been demanding the government to hold elections as soon as possible, at least in those provinces where law and order situation is under control,' he adds.

Salman Abid, political commentator and Regional Director Strengthening Participatory Organization (SPO), says it is understandable why PML-N is so keen to abolish the system—'because the party puts more trust in bureaucracy than in public representatives. A corrupt system is a mere excuse. The proposed amendments in the ordinance as recommended by PML-N will change the complexion of the system totally.'

The PML-N proposed amendments include regaining the control of 12 departments devolved under 2001 ordinance while the number of councillor has also been reduced to 9 from 13. The party also proposes suspension of citizen community boards with the main focus on indirect election. Only 9 councillors would be elected through direct election while the rest through indirect elections. More significantly, PML-N proposes non-party elections of local governments for the next term.

The focus, asserts Abid, should be on making the current system more effective, and most political parties had decided to not disturb the political institutions under the Charter of Democracy. 'The problem is that in Pakistan every elected representative from councillor to president wants his/her control on the development budget, so the powerful prevail, for good or bad, for democracy or not,' he concludes.

IV.

Naila Inayat examines the issue of women and local government.

I am zealously watching the TV footage of former president Clinton's visit to India. I see him sitting among a group of village women from Rajasthan, discussing democracy and power. The women are all elected representatives of the panchayats. Running a dairy cooperative, they initiated loan schemes for poor, landless women in their area.

I still remember I was simply floored by the confidence these women exuded as they discussed the lack of jobs and other issues with the then president of the world's superpower. And I wondered if we would ever get to see something like that in Pakistan where, for years, women's political participation has been confined to being voters or campaigners for male candidates. Very few have been elected as public representatives on general seats at any level—federal, provincial, or local.

In the subcontinent, since 1935, a special legal provision has existed for women's reserved seats in legislative bodies. The Devolution of Power Plan 2000 has been a key development in the history of governance. Musharraf's government in March 2000 launched decentralization under the Local Government Ordinance (LGO) whereby 33 per cent quota for women at the District, Tehsil and Union council levels was adopted.

The question arose as to how could women use this critical mass to affect public policy, particularly policies like gender issues, poverty, education and mainstream themselves in the political arena. Today, almost eight years later, we have examples of many exuberant women councillors who have found themselves through the LG system and are indebted to it. Here are a few of them sharing their thoughts with TNS.

Shamim Qaiser, Dictrict Councillor from Peshawar, says, 'I remember, in 2001 when the local government election schedule was announced, Aurat Foundation aired a radio programme from Gilgit asking, 'Will any women contest the elections?' I went on air and said that the system would get an overwhelming response because women wanted to be heard. Many people were skeptical about the 33 per cent quota being 'wasted' but the reception was good indeed.

'Women got an opportunity to come out of their homes and work for the welfare of the people at large. In 2001, I was elected from Shaheen Town and for four years you should come and see how many developmental projects I initiated. From making roads to installing tube wells and laying sewerage lines I have worked on a variety of things—something that you wouldn't generally expect from a woman.

'Like all new systems even 2001's LG system has loopholes, such as the allocation of funds for women councillors. We faced a lot of problems in claiming our share in the pie; we had to fight for it and a lot of times come out victorious. However, it doesn't give anyone the right to wrap up the entire system; necessary amendments should be made and more power should be given to the people's representatives.'

Shamim Mumtaz, City Councillor from Karachi, says, 'I won the election from UC 10, Sardar Town, on the Labour seat. Honestly speaking, no one in my family has ever ventured into politics; I am the first one. But my family was very supportive and encouraged me to work for the good of the people. I have been a social activist and have worked on issues of health, unemployment, education, etc. I know that in order to be heard you have to be part of the decision-making process and the LG system is there for this very purpose.

'I am not the only one who has benefited from the system; I know women who have come up from rural Sindh. I'm sure in those under developed areas it would be much harder compared to urban areas.

'Initially, it was very difficult for me to voice my opinion in the assembly. But after attending training sessions and workshops with the private NGOs I gained a lot of confidence. This system has given us a platform to voice our views. Though there still are women who are hesitant to become part of participatory politics. Trust me, it is nothing short of a small revolution.'

Farzana Mumtaz, Programme Coordinator, Advocacy and Networking South Asia Partnership-Pakistan says, 'It was for the first time in the country's history that a mass of almost 40,000 women councillors were seen in any form of governance or decision making.'

She believes that it opened up not only an enormous political space but also a strategic opportunity for women to join in and make a difference in setting and implementing people's agenda. 'However, now the PPP led-government wants to bring back the 1979 LG system which at least will not benefit the women, the minorities and the labourers. Most women councillors want the 2001 Local Government Ordinance to be amended. How can they impose administrators on the masses?'

V.

Zulfiqar Shah examines how the Musharraf District Government system benfitted some parties, and how others felt excluded.

As the local government completes its second tenure in October this year, several controversies have already surfaced that question the merits and demerits of the system. Ideally, the local government should be followed by elections and, eventually, the coming into power of the next set of elected representatives. However, the current situation is such that the entire system seems to be at stake, as those for it and those against the system are pitched against each other.

PML-Q and MQM, the two biggest beneficiaries of the Musharraf policies including those regarding the local government system, are going all out to save the system which, they believe, has served the masses well at the local level whereas it works for them.

On the other hand, PML-N and PPP believe that the system was introduced to marginalize mainstream politics. They want massive changes or else a wrap-up of the system.

Within these controversies, hardly any one is looking seriously into details of the benefits this system has or even the losses it entails.

Those who were a part of the system have mixed views on the merits and demerits of the devolution system and they find it hard to tell whether it was beneficial.

In view of Munazza Hashmi, a high court lawyer and member of district council in Multan, the system has brought in representation at the grass roots level which is 'a very positive thing'. However, she adds, little or no power rests with those who came up through the grass roots.

'There were elected representatives but they had no power,' says Munazza. 'The local government ordinance was not clear; power rested only with the nazim, reducing the other members of the union council to just nominal heads.'

The LG system as outlined in the local government ordinance of 2001 provides 33 per cent representation to women, 5 per cent to peasants and labour and one seat to minorities in each union council (UC). Experts on the devolution plan think that the local government system provided a large space to middle and lower class citizens who otherwise remained outside (local) power corridors. 'The space created by the representation of women, labour and minority representatives is important,' says Salman Abid, Regional Manager, Strengthening Participatory Organization (SPO), and an expert on local government system. 'You can see a lot of movement by these groups; even the recent resistance against scrapping of the local government system is proof that people got space because of the system.'

Obviously, the system is not free of flaws and needs due attention and attempts to address them. For instance, there is a general perception that the system was not implemented in the way it was perceived or propagated and there was no devolution of power at all.

However, the debate generated in recent months on whether the system should continue or not makes one thing clear that there is a popular demand for devolution of power. Political statements, speeches in seminars organized by civil society organizations as well as discussions with the PPP leadership suggest that there is a need to devolve power. There can be differences on whether it should continue to be as the Musharraf model or remodeled. Salman says the demand is also the result of the two tenures the system has seen.

The local government system has also devolved 12 departments from provincial level to district levels and brought them under district level control. Confusion around legal issues related to this plan and also a tussle between provincial departments and district governments made this devolution difficult and on many occasions the nazims and provincial ministers went against each other publicly.

The local government ordinance is blamed for most of the problems attributed to the system as it does not clarify power sharing and also the devolution of departments.

'Entire power rests with *nazims* without any checks and balances,' says Munazza. 'You get elected, but have no powers. This creates problems for you at the local level.'

She does not agree that increase in the women's representation made any big difference.

Along with 25 other members she says she submitted a proposal for lady health park to be built in Multan, but it was never approved. 'We were 43 female members and supported the proposal, but 150 male members vetoed it.'

Despite these setbacks, she says all the women members have played their role in bringing local governance on track in the district. 'We pointed out and talked about it frankly in the council wherever we saw problems,' she adds.

There are other people who believe the system has many good, in-built spaces for village-level development programmes, but such CCBs were manipulated by *nazims* and district coordination officers. Full authority to nazims with no control of provincial and line departments had also leveled a lot of corruption allegations as allotment of contacts and use of funds remain a *nazim's* prerogative. The councils were supposed to be taken into confidence but they weren't.

NOTES

1. Much of this chapter was first written in 2005, as part of the Swiss National Science Foundation and the Swiss Directorate for Development and Cooperation (SDC) funded Project: *Swiss National Centre of Excellence in North-South Research Partnerships (NCCR-North-South)*. The chapter was written under the supervision of Dr Urs Geiser, In-charge Pakistan Programme, Development Study Group, Department of Geography, Zurich University; the Development Study Group is a member of the consortium of six Swiss research organizations which were involved in this Study. I am very grateful for detailed comments by Dr Urs Geiser. Developments since 2005 have been added to update to the present.
2. For the most part, in the context of Pakistan, much of the literature uses devolution and decentralization interchangeably and both terms are almost exclusively used with regard to local government. The subtle nuances and differences between devolution, decentralization and deconcentration are usually ignored.
3. Amongst the studies which look at post-1999 measures, see: Asian Development Bank/Department for International Development/World Bank, *Devolution in Pakistan*, in three volumes (Islamabad, 2004), (hereinafter referred to as the ADB/DFID/WB study); Nick Manning et al. *Devolution in Pakistan: Preparing for Service Delivery* (Islamabad: World Bank, 2003); Jackie Charlton, et al. *Pakistan Devolution: A Note in Support of the Development Policy Review, mimeo* (Islamabad: 2002); National Reconstruction Bureau, Government of Pakistan, *The Local Government Book* (Islamabad, 2002); Zulqarnain H Anjum, 'New Local Government System: A Step Towards Community Empowerment', *Pakistan Development Review*, vol. 40 no. 4, 2001; Aisha Ghaus-Pasha, and Hafiz Pasha, 'Devolution and Fiscal Decentralization', *Pakistan Development Review*, vol. 39 no. 4, 2000; National Reconstruction Bureau, Government of Pakistan, *Local Government Plan* (Islamabad, 2000).

22. A very large number of studies examining the local government system during the 1977–88 period (which, as we show, continued well into the 1990s) have been conducted, many of them looking at fiscal and financial issues in the 1990s when the debt and deficit crisis had reached unmanageable heights. Perhaps what is more interesting is that most of the studies that have been undertaken, deal almost exclusively with urban (municipal) reform rather than issues related to local government in general. It is not at all possible to give even a representative list, but for a small sampling of studies see: M. A. Z. Wajidi, *Local Government in Pakistan: A Case Study of Karachi 1842–1988* (Karachi: Royal Book Company, 2000); S. Akbar Zaidi,

'Politics, Institution, Poverty: The Case of Karachi', *Economic and Political Weekly*, vol. 32, no. 51, 1997; S. Akbar Zaidi, 'Urban Local Government in Pakistan', *Economic and Political Weekly*, vol. 31, no. 44, 1996; Applied Economics Research Centre, *Resource Mobilization by Provincial and Local Government in Pakistan* (Karachi: AERC, 1992); Applied Economics Research Centre, *Resource Mobilization and Institutional Capacity Study*, (in seven volumes) (Karachi: AERC, 1991); Applied Economics Research Centre, *Local Government Finances and Administration in Pakistan*, (in three volumes) (Karachi: AERC, 1990); Applied Economics Research Centre, *A Model of Municipal Finance in Pakistan* (Karachi: AERC, 1990). In addition, the extensive research work by Arif Hasan and Reza Ali, looking at urban, and hence municipal, issues, also need to be read for a better understanding of local government developments throughout the 1980s and 1990s.

27. See *The News* on Friday, Special Report on Local Bodies, 30 September 1994.
28. Ali Cheema et al. op. cit., forthcoming.
29. For example, Fakhr Imam, the Speaker of the National Assembly emerged on the national scene starting his political career at the local level in Faisalabad, as did Farooq Leghari who came from the district level elections in Dera Ghazi Khan to eventually become President of Pakistan; the Mayors of Karachi and Lahore too, emerged as national level leaders once they were elected in the general elections. There are numerous other such examples.
30. Over a period of many months, elections were held under General Musharraf's Devolution Plan in 2000 and 2001 and all 106 District Governments were in place by August 2001. At the time of writing, August 2005, District Governments had completed their four year tenure and stood dissolved with the election process underway to elect new local government representatives.
31. This Section is drawn from a number of sources, in particular: Ali Cheema et al. forthcoming; N. Manning et al. op. cit., 2003; Ali Cheema, and Shandana Mohmand, op. cit., 2003; National Reconstruction Bureau, op. cit., 2002; and Z. Anjum, op. cit., 2001.
32. See many of the references cited in Note 22.
33. Although we are talking about the financial issues related to the 1979 LGO, it is important to say that many of the mechanisms of broad financial and budgeting are of a more generic nature and these problems and even the mechanisms, continue to exist.
34. See ADB/DFID/WB, op. cit., 2004.
35. *Dawn*, Karachi, 1 August 2005.
36. Since the 2001 District Government elections were held on a non-party basis, supposedly independent candidates were elected. In the 2002 party-based General Elections at the provincial and national level, political parties formed governments. Whenever the provincial government, particularly in the case of Sindh and the NWFP but in other provinces as well, came into conflict with a Nazim not of the ruling party in government in the province, the provincial governments made life very difficult for the Nazim, curtailing their mandate considerably, even starting summary proceedings against them on various occasions.

13 Fiscal Federalism in Pakistan: Emerging Dynamics, Issues, and Prospects[1]

Much has changed in Pakistan, at least on paper and in constitutional terms, in the way the government is to function and finances are to be allocated, after the passage of the Seventh National Finance Commission (NFC) Award,[2] and especially after the passing of the 18th Amendment to the Constitution of Pakistan,[3] in 2010. The earlier structures of finance, expenditure, relationship of the federating units with the federation, and other aspects of how Pakistan's government was required to be administered, changed quite radically as a result of these two landmark legislative actions, which were moreover adopted unanimously at the provincial and the federal level. Many of the earlier structures, as we showed in Chapters 10 and 12, are now redundant, and the provinces have been given far more responsibility for social sector development—see Part VII of this book. Although it has been three years since the passing of both, the 7th NFC Award and the 18th Amendment, the full consequences have not yet been realized nor have they become manifest in the way governments function in Pakistan. Moreover, the academic as well as political debates about the consequences of both have only just begun and there is limited literature which examines the possible outcomes of either or both. This chapter is one of the first to be written on these issues, and explores possibilities, and potential and possible consequences.

It is believed that these significant changes will transform the dynamics of the vertical structures of governance in a more rational direction and create horizontal equalization by strengthening decentralization and facilitating devolution of the power structure. Unlike the developments in Indian fiscal federalism after the 7th Indian Finance Commission (1979–1984) and compared to other developing countries, the process of systematic scientific rationalization of fiscal federalism had not taken place in Pakistan in the past. Consequently, increasing regional disparities created a sense of insecurity and injustice amongst deprived provinces. Noor- ul-Islam[4] argued that apart from other disturbing factors, fiscal disparities were the major concerns that led to the fall of East Pakistan. Apart from the linguistic movement of Bengali nationalism, military operation, and infringement of civil rights, there were constantly increasing inter-regional fiscal inequalities and disparities in the distribution of national resources which aggravated the sense of grievances and resulted in the Six Point formula of the Awami League, and spurred the separatist movement.

13.1 Pre-Independence Evolution and Development

The present evolution of federalism in Pakistan has a long history from the colonial rule of the British Empire to four different military regimes of thirty-three years, and various democratic governments. The three important legislative developments in British India were the Government of India Act 1885, the Government of India Act 1919, and the Government of India Act, 1935.

The Government of India Act, 1885: The Act is part of legislative developments under British rule. It developed a governance structure under Crown rule. Both the authority and the governance structure were predominantly of a centralized nature under this Act. The Secretary of State to India was given enormous judicial, financial, and functional powers with immediate delegation to the Viceroy/Governor General. For the purpose of the resolution of local territorial disputes, the judicial powers were delegated to the princely states. The relations with princely states, communications, and military were controlled by the centre.

The Government of India Act, 1919: During the period of the First World War, British rule undertook reforms in the subcontinent. The Montagu-Chelmsford proposal regarding political, administrative, and financial reforms were made part of the India Act of 1919. One of the fiscal developments was the assignment of irrigation and land revenue, forestry, and judicial stamp duties to the provinces, and the exercise of authority by the provinces was legitimized through this Act.

The Government of India Act, 1935: Analysing its political developments the Act approved a bicameral political system with a legislature consisting of two chambers, i.e. a Council of State and a Federal Assembly. The Council of State was a permanent body with one-third of its members being elected after every three years, while the duration of the Federal Assembly was fixed for five years. On account of fiscal developments, revenues, and expenditures, assignments were explicitly defined with a Federal Legislative List and a Concurrent List (the functions of which were the joint responsibility of both the centre and provinces). Details of revenue assignment and sharing under this Act were as follows:

1) Taxes were assigned exclusively to the centre, e.g. import duties, revenue of railways, posts, and telegraph. 2) Taxes assigned to the provinces e.g. agriculture tax, sales tax, land revenue irrigation charges, property tax on agriculture, tolls, payroll taxes, excises, and levy on natural resources.

3) Taxes imposed by the centre but having revenue sharing arrangements with the provinces, e.g. export duties from jute, export duties and income taxes except agriculture tax.
4) Taxes levied by the central government but distributed and allocated among the provincial governments, i.e. stamp duties, succession duties, freight earnings.

13.1.1 The Otto Niemeyer Award 1936[5]

On 19 September 1935, the British Government announced an enquiry into how and when to announce provincial autonomy in India which had been demanded for some years. The mandate of the enquiry was as follows:

> The need for inquiry arises from the fact that although the main outlines of the system of Federal finance have been established by the Act, it provides that the allocation of certain resources between the Central and the Provincial Governments of India shall be settled by Order-in-Council after the British Government has been furnished with an independent review of the position of the Provinces and the centre and with the technical advice that the financial questions involve.[6]

The final recommendations were submitted in 1936 and reported in the press as:

> His Majesty's Government may safely propose to Parliament that Part Three of the Government of India Act should be brought into operation a year hence. He has formed the opinion that the budgetary prospects of India, provided that there is prudent management of her finances, justify the view that adequate assignments can be made by steps to meet the financial implications of the new Constitution. In the detailed proposals submitted, the paramount importance, upon which the report insists, of preserving the stability of the central finances has been kept carefully in mind.[7]

The Otto Niemeyer Award recommended a vertical 50:50 revenue sharing arrangement between the centre and provinces. Under this Award and the 1935 Act, agriculture tax was primarily a provincial subject and not part of the divisible pool. Sales tax was also a provincial subject and was part of the central divisible pool. In addition, Sindh and NWFP were provided with annual fixed subvention of Rs.10 and Rs.10.5 million, respectively.

13.1.2 Post-Independence Evolution and Developments—NFC Awards in Retrospect

At the time of independence, the Government of India Act of 1935 remained in place as a provisional constitutional instrument pending Pakistan framing its own constitution. In the absence of regulatory institutions and banking networks the Reserve Bank of India continued its operation on both sides of the border, right up to the inauguration of the State Bank of Pakistan on 1 July 1948 under the Governorship of Zahid Hussain. Members of the Indian civil services of British India who migrated to Pakistan were assigned charge of important positions. Unfortunately, the quest for a new constitution for Pakistan diminished after the death of the first Governor General M. A. Jinnah on 11 September 1948 and the assassination of Liaquat Ali Khan on 17 October 1951. Later, on 28 May 1955, in pursuance of the Governor General's Order No. 12 of 1955, the second Constituent Assembly was instituted. The Assembly consisted of 80 members, 40 from each of the wings, East and West Pakistan. In 1956 this Constituent Assembly enacted the first Constitution of Pakistan.

Realistically speaking, during Pakistan's infancy, its national politics became part of a power game between the civil bureaucracy and the military establishment. Six governments were changed during a short span of seven years.

The dismal state of affairs brought radical institutional decay which continued over time. The ratification of the dismissal of the Constituent Assembly by the Governor General Ghulam Muhammad in the Maulvi Tamizuddin vs the Federation of Pakistan case by the higher judiciary advocating the principle of *Salus Populi suprema lux est* —'the good of the people is supreme law' set out a precedent for the abrogation of the Constitution in the future. Justice A. R. Cornelius was the only judge in the case to write a dissenting note in this landmark decision. This judgment altogether changed the course of politics in Pakistan. History continually witnessed such coups legitimized by the courts setting out the direction of Pakistan's destiny. The differences and conflict of interest between institutions and the overall dominance of the military over civilian government affairs, made it difficult for Pakistan to build its state institutions.

Fiscal administration and policy is not an exception, and the National Finance Commission has recorded a history of ad-hocism and a lack of scientific approach. We now discuss the individual NFC Awards as a historical narrative and their merits and demerits in detail in the following section.

13.2 The National Finance Commission Award: An Introduction

The public finance structure of Pakistan has been significantly dependant on intergovernmental fiscal transfers, i.e. transfers of public resources between various levels of government, federal, provincial, and local. This section is based on a historical narrative of the evolution of the intergovernmental fiscal transfers system and it focuses on transfers between federal and provincial governments. The transfers to the local tier of government are presently administered and governed through the Provincial Finance Commission, i.e. transfers of funds from provinces to local districts governments. Presently the federating units under the constitutional mandate of the National Finance Commission are the four provinces of Pakistan, i.e. Punjab, Sindh, Khyber Pakhtunkhwa (formerly

the North West Frontier Province NWFP), and Balochistan. The Federally Administered Tribal Areas (FATA), although part of the federation are not covered under the formal arrangement of the federal transfer system; however, a system of special grants is in place and functional for FATA.[8]

As per clause (1) of Article 160 of the Constitution of Pakistan 1973, the President of Pakistan shall constitute a National Finance Commission with a formal structure consisting of Federal Minister of Finance and four provincial finance ministers and non-statutory members (other persons) as may be appointed by the President after consultations with Governors of the provinces.

The primary responsibility of the members of the National Finance Commission is to advise the President on the distribution of resources from the divisible pool. After the separation of East Pakistan, the divisible pool transfers have been distributed on the sole basis of the population criterion. The 18th Amendment to the 1973 Constitution of Pakistan, added clause 3(A) and 3(B) to Article 160, where Article 3(A) gives protection to the province and specifies that the share of the province in each Award of the National Finance Commission shall not be less than the share allocated to the Province in the preceding Award. Clause 3(B) is related to the provision of good governance which has now become an important feature of the Commission's stipulation. The clause designates the Federal Minister Finance and provincial Finance Ministers to monitor and administer the implementation of the Award, and to present their reports biannually before both houses of Parliament and the Provincial Assemblies.

Apart from divisible pool transfers, under the article 163 of the Constitution, the NFC recognizes the rights of provinces on indigenous resources which are transferred by the federal government to the provinces directly as straight transfers.

The system of intergovernmental fiscal transfers by the federal government to the provinces, generally provides two types of fiscal transfers: 1) unconditional and 2) conditional transfers. The extent of unconditional transfers had predominantly greater weightage as compared to the conditional transfers in the overall intergovernmental fiscal transfers in Pakistan.

Unconditional Transfers

Divisible Pool Transfers

These transfers are vertical sharing arrangements between the federation and the provinces and after the NFC 2010, the size of the divisible pool available for the provinces has considerably increased. This is how greater financial autonomy is ensured. Further, the horizontal distribution criteria of the 7th NFC Award, 2010, provide for multiple indicators, i.e. population, poverty and backwardness, revenue collection and generation, and inverse population density. All of the Awards preceding the present one distributed revenues on the sole criterion of population. The Award-wise analysis of the post-1971 divisible pool transfers in Pakistan is shown in Table 13.1. On average, Punjab receives relatively smaller amounts on account of the divisible pool transfers as compared to its share in the total population, and the case of the rest of the provinces is more or less the converse. The divisible pool transfers had a neutral effect on fiscal equalization up to the NFC 1991 and 1997 Awards, and no equalization in the NFC 2006 Award. However, structural shifts to multiple criteria caused the transfers to be more equalizing which can be a policy objective of multiple criteria, although there are some inherent problems with this Award. Provinces have been given higher vertical shares and encumbered with high functional assignments after the 18th Amendment.

Straight Transfers

As shown in Table 13.2, Balochistan dominated initially on account of straight transfers and this supremacy continued until 1991, after which the share of Balochistan started declining. More recently, Sindh has benefitted by gaining a higher share in straight transfers. The question of fiscal equalization does not arise here because the right of provinces on these resources has been established, however, these transfers are fiscally administered by the federal government. Below we empirically discuss straight transfers in the context of fiscal equalization (*the Concentration Index*) in detail, and compute the concentration index to analyse the direction and beneficiaries of these transfers.

Special Grants

Fiscal equalization is the objective for successful administration of intergovernmental fiscal relations. Balochistan and Khyber Pakhtunkhwa are the provinces far behind Punjab and Sindh in terms of human development, health, and education indicators and growth rate in per capita income (see Tables 13.15, 13.16, 13.17, 13.18 and 13.19). Keeping in view the relative position of Balochistan and KPK, both are

entitled to special grants from the federal government. An important feature of these special grants is the indexation on the basis of CPI by the passage of time.

Conditional Transfers

Development Grants

The planning and development departments of the provincial governments prepare the Annual Development Programmes (ADPs) of their provinces. Following the approval of provincial ADPs by the Planning Commission of Pakistan, the federal government provides grants to the provincial government keeping in mind its own budgetary position.

The nature of grants for the Social Action Programme, Physical Planning and Housing Programme, Tameer–e–Watan Programme, Tameer–e–Sindh Programme are also of a conditional nature. See Table 13.3 for non-development grants which are more equalizing than development grants because the average magnitude of flow of non-development grants towards smaller relatively less developed provinces is higher than that of developed grants—see Table 13.4—however, on average both types of grants depict a similar pattern.

13.2.1 The Raisman Award 1951[9]

The Raisman Award was announced in 1951 without pre-defined constitutional arrangements. The vertical revenue sharing arrangement between the centre, provinces, and other federating units was 50:50 from the central divisible pool which consisted of income tax, sales tax, and excise duties. See Table 13.5 which shows that the ratio of distribution between East and West Pakistan was 45:55. Overall, this Award ensured the widening of the size of the divisible pool and shared more taxes as compared to the adhoc arrangements in place just after independence. Horizontal sharing was based on two principles: pre-assigned share and the derivation principle.[10] The distribution of income tax was based on a pre-assigned share with East Pakistan receiving 45 per cent, Punjab 27 per cent, Sindh 8 per cent, and Balochistan 0.6 per cent—see Table 13.5.

13.2.2 The National Finance Commission 1961–62

The announcement of the next Award was supposed to be made in 1956. However, almost ten years following the Raisman Award without any concrete development on the front of fiscal federalism, mainly due to continuous institutional decay and the dismal state of political and economic affairs in the country—see Table 13.6. Chief Martial Law Administrator General Ayub Khan instituted the National Finance Commission on 19 December 1961 with the constitutional mandate of developing a revenue

sharing formula (vertical and horizontal) and settling the tax jurisdiction (tax assignment and tax sharing) between the federation and the provinces. Reforming borrowing powers and the debt and liabilities structure of the provinces was also the part of agenda before the NFC. The Award came into effect from 1 July 1962 vide Presidential Order No. 23 of 1962 'The Distribution of Revenues and Consolidation and Repayment of Loans Order, 1962'.

Earlier, the government of Prime Minister Chaudhry Muhammad Ali, under rationalization of administrative reforms and to reduce the provincial expenditures and prejudices, had launched the One Unit[11] system under which the four provinces of West Pakistan were merged and declared as one province, with Lahore as provincial capital, and East Pakistan was declared the other province with Dhaka as provincial capital. After the formation of the one unit the horizontal revenue sharing came to be defined for the two provinces on the basis of 54:46 (East Pakistan:West Pakistan).

Unlike the Raisman Award, vertical sharing was not that simple, a heterogeneous mix of criteria for different kind of taxes was introduced to be vertically shared between the federation and the two provinces. The allocation of income tax was 50 per cent (minimum percentage allocation of any tax in this Award). Sales tax and excise duties were set out to be 60 per cent and all other taxes; export and import duties were allocated 100 per cent to the provinces.

As Table 13.7 shows, the horizontal distribution formula was primarily based on two criteria: pre-assigned shares (approximating the provincial populations), while the other taxes were shared on the basis of the collection principle. Income taxes, excise, and export and import duties, were shared on the basis of a pre-assigned share and sales tax was shared 30 per cent on collection basis and 70 per cent on a

* Presidential order 1 of 2006. In 2006 there was no consensus as to formulation of award therefore; President Pervez Musharraf passed a presidential order.
**The allocation of Grant out of this 3 per cent allocated among the four provinces was as Punjab (11 per cent), Sindh (21 per cent), KPK (35 per cent) and Balochistan (33 per cent). No scientific approach was adopted for the distribution.

pre-assigned share. Succession duties on agricultural land and capital value tax on immovable property, were fully assigned to the provinces. Further, the provinces were provided with a special concession of 50 per cent on their federal outstanding liabilities up to 30 June 1961 and the remaining 50 per cent loan was converted into a single loan of twenty five years carrying a mark-up rate of 3.5 per cent per annum.

13.2.3 The National Finance Commission Award 1964

After two years of the imposition of Martial Law by General Ayub Khan, a Constitution Commission was set up on 17 February 1960. The objective of the Commission was to submit a report to the President about the provisions of strengthening democracy, socioeconomic justice, and Islamic principles of justice. The report was submitted on 29 April 1961 and later the new Constitution of Pakistan, 1962 was promulgated and announced on 1 March 1962.

In pursuance of powers conferred upon him under Article 144(1) of the Constitution of 1962, the President instituted a National Finance Commission before the earlier Commission would have lapsed. In the case of vertical distribution, this Award performed better than the preceding one and allocated a comparatively higher share of 65 per cent to the provinces from the federal divisible pool comprised of income and corporate taxes, sales tax, excise duty on tea, tobacco, and betel nut, and export duties on jute and cotton—see Table 13.8. The horizontal criteria remained unaltered for the two provinces as that of NFC 1962, i.e. 54 per cent allocated to East Pakistan and 46 per cent to West Pakistan. The final recommendations of the Commission were applicable with effect from 1 July 1965 for a period of five years up to 30 June 1970.

In September 1965 war with India broke out and later in 1968 mass level unrest began. The situation was triggered by rising inequalities and disparities in the country. The controlled price of one kilo of sugar was increased by one rupee which led to mass agitation and extreme resentment, bringing people onto the streets. The situation ended with many casualties, following which Ayub's popularity declined. With this, came the time for the sunset of his dictatorial regime. He decided to hand over power to the Chief of Army Staff General Aga Muhammad Yahya Khan who declared another Martial Law after assumption of the office of President of Pakistan and Chief Martial Law Administrator (CMLA) on 25 March 1969.

Source: Author's tabulation from the reports of National Finance Commissions/Distribution of Revenues and Grants-in-Aid Orders of President of Pakistan.

On 31 March 1970 the President promulgated the Legal Framework Order (LFO), 1970, under which One Unit was dissolved and the provinces Punjab, Sindh, and NWFP (now KPK) were restored to their status prior to 22 November 1954, and a full-fledged province of Balochistan was created. Elections for a unicameral legislature and National Assembly were called under the mandate of Legal Framework Order (LFO). Unlike the Constitution of 1956 which ensured equal representation of the East and West wing, of 40 members each, the LFO declared proportionate representation for the two wings. The more populous wing East Pakistan, was allotted a share of 162 seats and West Pakistan 138 seats. The horizontal share of East and West Pakistan remained unaltered at 54:46. The decision of the dissolution of the One Unit system led to the distribution of the 46 per cent horizontal share of West Pakistan among the provinces to Punjab 56.5 per cent, Sindh 23.5 per cent, NWFP 15.5 per cent, and Balochistan 4.5 per cent.

13.2.4 The National Finance Committee 1970

Just after the dissolution on 17 April 1970, Yahya Khan constituted a Committee instead of carrying on a legacy of instituting a high-powered National Finance Commission. The committee was constituted under the Chairmanship of Nawab Muzzaffar Ali Khan Qizilbash, the then Finance Minister in the cabinet of the CMLA. The terms of reference of the Committee were to re-examine the existing arrangement of intergovernmental fiscal relations in the country and to recommend to the President on the vertical (between federation and provinces) and horizontal (between provinces) revenue sharing formula.

The Committee generously increased the vertical sharing by 15 per cent, i.e. now 80 per cent of the divisible pool resources were to be allocated to the provinces. The rationale behind this increase could have been to reconcile with the increasing disparities amongst the provinces and to grant the sub-national governments more fiscal powers. The overall size of the divisible pool as a percentage of federal taxes increased from that of the preceding one, by a significant percentage of 6.4 per cent, i.e. from 27 per cent to 33.4 per cent (see Table 13.8). On account of horizontal revenue sharing, the Award witnessed no change in the criteria—see Table 13.7.

The first general elections held in 1970 after the independence of Pakistan led to the Awami League of Sheikh Mujib-ur-Rehman winning 160 seats out of 162 in East Pakistan based on his Six Points campaign demanding greater provincial autonomy. PPP emerged as the second largest party with 81 seats. Yet Mujib was denied formation of his government in the National Assembly. In Operation Searchlight by the Pakistan Army, he was arrested on 26 March 1971. During his arrest and due to denial, despite attaining a 55 per cent majority, immense crisis erupted in East Pakistan. Later the crises became a movement of civil disobedience leading to military suppression by the Pakistan Army, resulting in East Pakistan becoming Bangladesh on 16 December 1971 after the surrender by Lieutenant-General A. A. K Niazi, joint commander of Pakistan before Lieutenant General Jagjit Singh Aurora, joint commander of the Bangladesh-India Allied Forces. After the fall of East Pakistan, CMLA General Yahya Khan handed over power to Zulfikar Ali Bhutto, the leader of PPP who had gained victory in West Pakistan. Z. A. Bhutto assumed office on 20 December 1970 as President and first Civilian Martial Law Adminstartor (CMLA) of Pakistan.

On the fiscal federalism front post-1971, the share of East Pakistan was retained by the federal government on account of managing its priorities and to meet its huge expenditure needs in rebuilding the country. The provinces in West Pakistan (present Pakistan) continued to enjoy their respective shares out of the 46 per cent of the vertical share. The average vertical fiscal imbalance was 40.3 per cent (see Table 13.9) during the period 1972/3 to 1974/5, which is the highest from 1971 to date. One major change and shift in the course of federalism was a sharp decline in the collection of taxes. Export duties on jute and other taxes had been contributing a huge share to that effect. On the external account, the export of jute had been the main source of exchange earnings.

13.2.5 The National Finance Commission Award 1974

The second phase of the intergovernmental fiscal relations in Pakistan starts from 1971. West Pakistan (present Pakistan) administratively consisted of four provinces and federating units such as FATA, Gilgit-Baltistan[12], and Azad Kashmir. Although the federating units other than the provinces were not covered under the mandate of NFC Awards, provision of special grants was functional.

Meanwhile, on 17 April 1972, Bhutto invited all parliamentary parties for a meeting which ended with a consensus on the need for a new constitution for Pakistan. PPP appointed a 25-member committee on 17 October 1972 under the chairmanship of Abdul Hafeez Pirzada to prepare a draft for the new constitution. The draft bill of the new constitution was moved in the National Assembly on 2 February 1973 and passed by the Assembly unanimously on 19 February 1973.

Another important development was the population census of 1972 which was delayed by one year due to the insurgency in East Pakistan and war with India. As Table 13.10 shows, the census revealed that the composition of shares of provinces, changed, and the share of Punjab and NWFP had declined by 2.15 per cent (from 62.09 per cent to 60.09 per cent) and 0.60 per cent (from 14.01 per cent to 13.41 per cent), respectively in the national population. Sindh and Balochistan experienced an increase in their share in the population by 2.17 per cent (from 20.45 per cent to 22.62) and 0.57 per cent (from 3.31 per cent to 3.88 per cent), respectively.

Articles 160 to 165 of the Constitution of Pakistan, 1973 describe the role of the National Finance Commission, the role of federation and provinces' and ancillary matters. On 9 February 1974 the NFC was constituted in pursuance of Article 160 of the new Constitution. The major changes this time were inclusion of fewer taxes in the federal divisible pool, i.e. income and corporation tax, sales tax, and export duties. The vertical revenue sharing arrangement between federation and provinces remained the same 20:80 (Federation:Provinces). While horizontal sharing was simplified and based on the latest available statistics on the share of the population of the provinces, population was made the sole criterion for distribution of divisible pool resources. This remained the sole basis for horizontal distribution up to the 2010 Award. It is believed that this situation resulted in the dominance of Punjab—the reasons for Punjab's dominance were many—one of them being that Punjab had the largest representation in the National Assembly on the basis of population.

The Commission recommended that the provinces of NWFP and Balochistan were relatively less developed compared to the rest; therefore, on account of their poverty and backwardness, federation subventions of Rs. 100 million and 50 million, respectively, were fixed for them. Special maintenance grants for highways and agency work were approved in this Award. No ceiling was imposed on the borrowing limits of both tiers of government. The provisions of this Award were functional with effect from 1 July 1975.

Chief of Army Staff General Zia ul-Haq proclaimed the third Martial Law in the country on 5 July 1977 and promised to hold general elections in three months; however, he remained in power for a period of eleven years. The Zia government filed a murder case against former Prime Minister Bhutto and awarded death sentence to him.

13.2.6 The National Finance Commission Awards, 1979 and 1985

On 11 February 1979 President Zia asked the National Finance Commission to make its recommendations about vertical and horizontal revenue sharing and to suggest improvements in intergovernmental fiscal relations. Perhaps this is the only such Award in history which was not announced, as not a single meeting of the members of the Commission was held until 1983. Therefore, the provisions of the NFC 1974 Award continued on an ad hoc arrangement with a change in percentage shares of population of provinces in the national population as per the 1981 census, i.e. Punjab 57.88 per cent, Sindh 23.29 per cent, NWFP 13.54 per cent, and Balochistan 5.30 per cent—see Table 13.10. The relative shares of all provinces in the population increased with the exception of Punjab. As Table 13.10 shows, the relative share of Punjab declined by 2.21 per cent (from 60.09 per cent to 57.88 per cent) and Sindh, NWFP, and Balochistan on the other hand registered an increase of 0.67 per cent (from 22.62 per cent to 23.29 per cent), 0.13 per cent (from 13.41 per cent to 13.54 per cent), and 1.42 per cent (from 3.88 per cent to 5.30 per cent) compared to the earlier population census. The recommendations of the Award were made effective from 1 July 1983.

All three dictators, Ayub, Zia, and Musharraf, had the privilege of instituting the National Finance Commission twice during their rule. On 25 July 1985 in pursuance of powers conferred upon him under Article 160, Zia constituted another National Finance Commission. The terms of reference for this Commission were the same as of the earlier Award. Nine meetings were held and no consensus upon horizontal revenue distribution was arrived at by the provinces. The President declared the 1974 NFC Award to remain effective with the population shares of 1981 census being effective.

In 1985 non-party-based general elections were held, and Muhammad Khan Junejo was nominated as the tenth Prime Minster of Pakistan. Later on the legislature approved the 8th Constitutional Amendment and legitimized all acts including the Martial Law of 1977. After the passage of this amendment basic fundamental rights were restored and Martial Law was lifted by Zia. After the investigation of the Ojhri Camp incident, Junejo made a statement on the floor of the House that the report of the findings of investigation on the Ojhri Camp incident would be placed before the House. This raised serious concerns in the military leadership and Zia dismissed Junejo on 29 May 1988. He announced fresh elections to be held within three months but no elections were held until his death in a plane crash near Bahawalpur on 17 August 1988. Following the death of Zia, General Aslam Baig was nominated as COAS and Chairman Senate Ghulam Ishaq Khan took charge as Caretaker President. The President announced general elections to be held on 16 November 1988 to elect 336 members of the National Assembly and 100 senators. Pakistan People's Party emerged victorious and Benazir Bhutto took oath as the Prime Minster on 2 December 1988. On charges of corruption and nepotism, her government was dismissed by the President exercising his powers under Article 58(2)b. The President then announced new elections and PML–N emerged as the victorious party and formed the government. Prime Minster Mian Nawaz Sharif took charge on 6 November 1990.

13.2.7 The National Finance Commission Award 1990

It is the constitutional responsibility of the President to constitute the National Finance Commission after every five years. However, this Commission was constituted sixteen years after the NFC of 1974. Although the two Commissions of 1979 and 1983 were constituted, both failed to reach a consensus. Due to the long delay in the announcement of the Award, revenue deficit grants were allocated to the provinces by the Federation, especially in the late 1980s. This delay raised valid expectations amongst the provincial governments that the financing of the provincial revenue deficit was guaranteed, which resulted in massive increase in recurring expenditures of the provinces. Further, this delay aggravated a sense of deprivation amongst the three provinces Sindh, NWFP, and Balochistan due to Punjab enjoying a larger share of the pie due to its relatively large share in the population given that the divisible pool distribution continued from the 1974 NFC Award population-based formula.

On 23 July 1990 the President constituted the National Finance Commission under Article 160 of the Constitution. The Commission consisted of ten members initially. Later, upon the advice of the newly elected Prime Minster, four new non–statutory members (one from each province) replaced the existing ones. In addition to the recommended vertical and horizontal distribution, the mandate of the 1990 Commission was to advise the President on the comprehensive mechanism for the distribution of proceeds of natural resources (royalties on crude oil and surcharges on natural gas). Furthermore, the Commission was asked to suggest a procedure of grant-in-aid and made recommendations on the borrowing powers for the federation and provinces.

In order to rationalize further the regime of federalism and to increase the size of the divisible pool, excise duties on tobacco, tobacco manufactures, and sugar were added to the existing stream of taxes comprising the divisible pool. Another important development was to recognize the right of provinces to profits and royalties arising out of the use of their indigenous resources, such as development surcharges on natural gas, profits on hydroelectricity, and royalty on crude oil.

Using the principle of production basis, gas development surcharge was paid to the provinces after deduction of 2 per cent collection charges by the collecting agency—the federal government. Net profit of hydro-electricity was paid to the provinces on the basis of the location principle. Royalty from crude oil was also paid to the provinces on the basis of the production principle. This Award recommended royalty and excise duties on natural gas to be paid to the provinces. This kind of revenue transfer system is called a 'straight transfer', meaning revenues arising out of indigenous resources are credited directly to provincial accounts by the collecting agency on the origin principle. Straight transfers increased the fiscal space for the relatively less-developed provinces NWFP and Balochistan due to concentration of natural resources in the these provinces.

In the 1990 Award, vertical and horizontal criteria were same as in the previous Award. Vertical sharing was 80:20 (Provinces:Federation) and horizontal sharing was based on the last available population census of 1981.

The provision of grants for the revenue deficit of the sub-national governments in fact incentivized them to incur huge expenditures and ignore own-source revenue efforts, relying primarily on federal transfers. The Award made the provinces themselves responsible for the surpluses or deficits by abolishing federal grants for provincial revenue deficits. However, the Award legitimized fixed annual subvention/grants to the provinces—see Table 13.11.

13.2.8 The National Finance Commission Award 1997

After the dismissal of the first Nawaz Sharif government in 1993, and after Benazir Bhutto had won the elections to become Prime Minister a second time in 1993, President Farooq Laghari instituted the National Finance Commission on 23 July 1995 with the mandate to make recommendations on vertical and horizontal revenue sharing and in light of

Table 13.11
Fixed Subvention to the Provinces: NFC 1990

Provinces	Rs. in million	Period
Punjab	1000	3 years
Sindh	700	5 years
KPK	200	3 years
Balochistan	100	3 years

Source: Compiled from Report of National Finance Commission

appraisal of earlier Awards. The Commission comprised of the Federal Minister Finance as Chairman, four provincial ministers, four non-statutory members each from one province, advisor to the Prime Minister, and Federal Secretary Finance. There were a couple of important developments in this Award.

First of all, the Award signalled the expansion in the divisible pool by inclusion of all taxes including custom duties, which was not part of the pool in earlier Awards. The new divisible pool after expansion contained income and corporate taxes, wealth tax, capital value tax, sales tax, custom duties, and excise duties (excluding excise duty on gas, charged at wellhead).

In every Award the vertical share was either retained, as in the preceding Award, or increased substantially. On account of vertical revenue sharing, this is the only Award in history where the share of provinces was cut down by a huge 42.5 per cent compared to the earlier Award, i.e. from 80 per cent to 37.5 per cent. Moreover, the divisible pool as a percentage of federal tax revenues was also decreased substantially by three per cent (from 38 per cent to 35 per cent)—see Table 13.8. The argument of the federation was that the earlier Award vertically shared a higher share but with fewer number of taxes; but now that the vertical share had been decreased and the pie of the divisible pool expanded, the provinces would no longer be in loss. Furthermore, the distribution of straight transfers continued as per the established formula of the 1992 NFC Award.

The allocation of the annual fixed subvention arrangement by the federation under the 1997 Award was Rs. 4,080 million and Rs. 3,320 million, for Balochistan and NWFP, respectively. An annual increase of 11 per cent to the fixed subvention was proposed subject to further revision due to indexation according to prevailing inflation in the future.

For the first time in Pakistan, the concept of matching grants against the sub-national fiscal effort was recommended by the Commission. The scope of the provincial fiscal effort was defined as an increase in the rate of provincial taxes, withdrawal of exemptions, imposition of new taxes, and revision and updation in rates of user charges. Provincial own-source revenues equal to or greater than 14.2 per cent growth subject to a maximum upper limit of Rs. 500 for Punjab and Rs. 100 million for Sindh, NWFP, and Balochistan was assured.

Another important step by the federation in the 1997 Award was to abolish the octroi *zila* tax. In lieu of the octroi tax, the federal government increased the rate of general sales tax (GST) from 12.5 per cent to 15 per cent. The provinces were guaranteed under the head of non-development grant, transfer of an amount equal to 2.5 per cent (additional GST revenue) on the basis of octroi estimates on the base year 1998.

On macroeconomic reforms, Pakistan was pursuing a Structural Adjustment Programme of the IMF for rationalizing the tariff regime and taxation structure to reduce the fiscal deficit which resulted in reduction in revenues—also see Chapter 17. Moreover, just after Pakistan tested its nuclear devices, international sanctions were imposed coupled with recession in the international and domestic economy, and economic activities were hampered—see Chapter 18. As a whole, provinces suffered the most because they had agreed to a 45.2 per cent (from 80 per cent to 37.5 per cent) reduction in their vertical share and horizontal sharing was only based on the population criterion.

13.2.9 The National Finance Commission Award 2006

12 October 1999 witnessed the fourth regime military in Pakistan's history. COAS General Pervez Musharraf took charge as Chief Executive of the country. Under the Musharraf regime the President constituted the National Finance Commission three times, since the first one on 2 July 2000, but as no recommendations came forward, the President constituted the Commission again on 13 November 2003. Eleven meetings of the Commission were held within two years but no criteria on vertical and horizontal sharing were agreed. The government's intention was to reform the existing system and establish a just and fair mechanism for intergovernmental fiscal transfers in the country. Smaller provinces had many reservations on various matters of national importance including the Kalabagh Dam, the water distribution formula by the Indus River System Authority (IRSA), and the National Finance Commission. The bone of contention for not agreeing the formula was actually the vertical sharing arrangement. The provinces demanded a minimum guaranteed share of 50 per cent in the federal divisible pool due to which differences with the federation could not be resolved.

On horizontal distribution, the three smaller provinces Sindh, NWFP, and Balochistan had varying arguments and reservations. Therefore, the NFC should have worked for a redress of the legacy of the preceding Awards which the Commission could not manage to do. Sindh's argument was to make part of the allocation on the basis of revenue collection and generation in which Sindh had absolute advantage, mainly on account of the port facility which gave Karachi/Sindh monopoly over collection of indirect taxes, such as the sales tax, FED on imports and custom duties—for further details see Chapter 23 on Karachi. NWFPs and Balochistan's arguments were based on the poverty and backwardness criteria with one argument specific to Balochistan based on area, i.e. inverse population density. However, Punjab was not ready to move an inch from its position on population-based transfers.

As a result, the President constituted the Commission for a third time on 21 July 2005, but the difference still persisted between representatives of all the provinces. Therefore, under article 160(1) of the Constitution, the President exercised his powers and a formal arrangement of transfers was announced vide 'Distribution of Revenues and Grants-in-Aid (Amendment) Order, 2006', President Order No. 1 of 2006.

The order was made applicable with effect from 1 July 2007. Horizontal sharing continued on the population principle, perhaps because the military president, General Pervez Musharraf, did not want resentment from the largest province whose representation in the population, the National Assembly, and the military was dominant. However, the vertical sharing arrangements took into account the growing needs of the provinces and increased the vertical share from 37.5 per cent to 41.5 per cent in the first year of the Award, i.e. fiscal year 2007. In the second year an increase from 41.5 per cent to 42.5 per cent and from the third year to the fifth an increase of 1.25 per cent was recommended; therefore, the proposed allocation for the fiscal year 2011 was 46.25 per cent—see Table 13.8. These annual increments were made a feature of the Awards for the first time in Pakistan.

The Revenue Order, 2006, revised the 1/6th distribution of sales tax to the provinces to compensate for the octroi losses. The revised formula was based on collection (Punjab 50.0 per cent, Sindh 37.5 per cent, NWFP 9.93 per cent, and Balochistan 5.22 per cent) and 1998 population share (Punjab 57.36 per cent, Sindh 23.71 per cent, NWFP 13.82 per cent, and Balochistan 5.11 per cent) on a 50:50 basis.

Provisions of special grants by the federation to the provinces were incorporated into this Award. An amount of Rs. 27.5 billion was allocated for this purpose to be increased annually according to growth in taxes. The provisions of allocations for these grants were mainly judgmental and did not follow any scientific approach or equalization needs. The share allocation was Punjab 11 per cent, Sindh 21 per cent, NWFP 33 per cent, and Balochistan 35 per cent. However, the relative shares were indicative that these transfers would have created fiscal equalization, and an objective empirical assessment would reinforce the same.

Fiscal year 2007/8 brought much unforeseen and unexpected turmoil and difficulties for Pakistan's economy due to extreme political unrest and several economic events in the international world. Some of these events were poor law and order, adverse supply shocks, sharp rise in prices in oil, food and other non-food consumable items, and a financial meltdown in the international market. The situation was coupled with political unrest in the country which aggravated when the President imposed an Emergency on 3 November 2007 and the judges of the Supreme Court were detained unlawfully. This spurred the judges' restoration movement country-wide. Meanwhile, general elections were first called for 2007, but had to be postponed until 2008 following the assassination of Benazir Bhutto. The PPP emerged as the majority party and formed the government in the centre, and in Sindh, NWFP, and Balochistan. The Punjab government was formed under PML–N. Asif Ali Zardari was elected as President of Pakistan on 6 September 2008, replacing General Musharraf.

13.3 The National Finance Commission Award 2010

Before the time frame of the NFC Award of 2006 would have expired in 2011, President Zardari under Article 160 of the Constitution of Pakistan 1973, constituted the National Finance Commission on 24 July 2009 and assigned the mandate of rationalizing the present stream of fiscal federalism in Pakistan. *This was the first time since the separation of East Pakistan that the design of intergovernmental fiscal transfers was redefined and redressed.* The most important move in this direction has been the structural shift towards multiple criteria based on revenue distribution (see Table 13.7), rather than on the basis of population alone, which was the basis of previous Awards—also see Tables 13.12 and 13.13. Most surprisingly, Punjab gave up a portion of its share, 5.62 per cent, and the redistributive effect was that Sindh gained 0.84 per cent, and NWFP 0.80 per cent; moreover, the special needs of Balochistan were considered and a significant addition of 3.98 per cent was made possible to its share—see Table 13.13. Furthermore, the federation sacrificed more than 10 per cent of its share compared to the 2006 NFC Award and distributed it to the provinces—see Table 13.8. The province of Khyber Pakhtunkhwa (KPK)had been badly affected by the War on Terror, and the present Award was supplemented by a special provision of assigning one per cent of the net proceeds of the divisible pool taxes to the KPK government to meet its additional expenses as a consequence of the war. Table 13.13 shows that the net impact to the two provinces, Sindh and KPK, was nearly equal, which seems in opposition to rationality, because both the provinces differ greatly in terms of their socio-economic indicators, and therefore, the gains may not be similar due to the large differences between the

Table 13.12

two provinces. In the next sections, we discuss these multiple criteria with some empirical analysis. We will discuss the pros and cons and the potential future agenda for fiscal federalism reforms in Pakistan.—also see Boxes 13.1 and 13.2.

13.3.1 Population Criteria

Pakistan has been amongst the top ten most populous countries of the world. Though the inter-census growth rate of population has been declining over the period in Pakistan (see Table 13.14), the rate of growth is still higher than the average growth rate of South Asian and developing countries. As Table 13.14 shows, in the case of Sindh the overall population growth has decreased to 2.62 per cent from 4.06 per cent in 1951–61, 4.51 per cent in 1961–72, and 2.75 in 1972–81.

For a social planner the situation is fairly complex: should dividing the pool of divisible resources be on a population basis as it has always been? If yes, then why should fiscal intervention not take into account the highly diverse population attributes of all federating units and their dynamics over time such as growth rates in rural and urban regions, large and small cities? These are questions which need to be asked.

Two of the criteria, for the NFC Award 2010 are based on population, i.e. population and inverse population density, which highlights the importance of the availability of reliable, updated estimates. The NFC Award 2010 calculated the respective 82 per cent shares of provinces on the basis of their share of population in the population according to the fifth census of 1998—see Table 13.10. (Punjab: 82 per cent of 57.36 = 47.04, Sindh 82 per cent of 23.71 = 19.44, KPK 82 per cent of 13.82 = 11.33, and Balochistan 82 per cent of 5.11= 4.19)—see Graph 13.1.

Although the consensus on the multiple criteria recommended by the NFC Award 2010 is path-breaking and has changed the course of fiscal federalism in Pakistan, nevertheless, the criterion of population has been given extraordinary weightage, which could sacrifice the equalization objectives of fiscal federal transfers. Before 2010, Pakistan always practiced the exclusive population-based criterion to distribute divisible pool taxes, which in reality resulted in the dominance of Punjab on account of its largest share in the population. This aggravated the sense of deprivation and economic injustice amongst the other provinces. The structural change in the formula of the divisible pool, i.e. multiple criteria, is considerable progress on the contemporary canvas of fiscal federalism in Pakistan. The share of Punjab has substantially been redistributed amongst the relatively less developed provinces and its traditional dominance has been voluntarily sacrificed—see Graphs 13.1 and 13.2, and Table 13.12 and Table 13.13.

Table 13.13

Box 13.1

The New Fiscal Federalism

Ishrat Hussain examines the new fiscal federalism and writes:

Most of the pre- and post-budget seminars, TV shows and discussions, and public discourse this year focused exclusively on the federal budget. Past traditions are hard to break but the new realities in our face should wake us up.

The 7th NFC Award and the 18th amendment to the Constitution have brought about a fundamental structural change in the fiscal affairs of Pakistan. The federal government is no longer the main driver of fiscal policy. Power and resources have shifted, rightly so, to the provinces. The share of the federal government in the net proceeds of the divisible pool has come down to 42.5 per cent while that of the provinces has gone up to 57.5 per cent. Adding straight transfers, grants/subventions, and development loans to the provinces pushes this share further up.

In the last four years, the total outlay of the provincial governments has risen from almost Rs. 1,000 billion to Rs. 1,800 billion—an increase of 80 per cent. Almost 89 per cent of this amount has been financed by the federal transfers, which have almost tripled from Rs. 520 billion to Rs. 1545 billion. Only 11 per cent has been raised by the provincial governments from their own revenues—tax and non-tax. In 2007–08, the provinces' own contribution to the total outlay was 15 per cent.

How has this increase in federal transfers affected the pattern of expenditures? The share of development expenditure in total expenditure has declined from 34.5 per cent to 33.3 per cent while that of current expenditure has risen from 65.6 per cent to 66.7 per cent.

It was widely believed that as the provinces spend most of their money on education, health, drinking water, agriculture & irrigation, the ordinary citizen would benefit from this transfer of resources from the federal to the provincial governments. Preliminary estimates show that this assumption has not proved to be true. Punjab has allocated only six per cent of the total outlay while Khyber Pakhtunkhwa seven per cent for health and education. Only Sindh has increased the allocations this year.

The devolution process remains incomplete as the functions, authority, and resources have not been delegated to the district governments. As there is an administrative vacuum at the district level, most of the financial resources that were accruing to the districts are now retained by the provincial governments.

While the provinces are now quite flush with resources that are derived from the divisible pool, the federal government is stuck in a difficult fiscal situation. As most of the rigid and inflexible expenditures such as debt servicing, defence, civil armed forces, and subsidies fall upon the federal government, it faces financing problems in the face of a declining share in the overall tax pool. The growing fiscal deficit cannot be brought under control because of the asymmetry in the assignment of revenues and location of responsibility for expenditure. The financing of the fiscal deficit by borrowing from the State Bank of Pakistan has kept inflation high. Macro-economic stability remains elusive, investor uncertainty prevails, and growth is subdued.

We have to recognize the new realities of fiscal federalism for Pakistan. Attention and policy objectives have to shift from the federal to the provincial governments. Institutional arrangements of the past are no longer adequate to respond to the challenges of the future. New institutional arrangements and policy changes have to be put in place. What are these?

First, the present practice of budget formulation by the federal and provincial governments in isolation has to be replaced by an integrated budgetary framework prepared, discussed and debated at the Council of Common Interests (CII) and approved by the National Economic Council (NEC). The federal and provincial governments will have to formulate their budgets within the parameters approved by the NEC. Sanctions should be put in place for violations, breaches, and deviations. However, the provinces should be allowed to exceed the NEC-approved parameters if they raise additional revenues from their own sources.

Second, a new fiscal responsibility law should be enacted by each province in which the limits for fiscal deficit/surplus, revenue mobilisation, and expenditure on development should be imposed. If the allocation for the provinces from the divisible pool rises or provinces make an extra tax effort, the incremental resources should be earmarked for development projects or for education and health. Provinces have to generate budgetary surpluses in order to offset the deficit of the federal government.

Third, the provincial governments should not be allowed powers to borrow from the domestic capital markets or financial institutions. Foreign loans for development projects and foreign grants should be channeled through the federal government and conform to the NEC-approved national plan and annual budget. The advances of the SBP should be strictly used for smoothing cash flow problems rather than as additional financing for the budget or non-budget expenditure.

Fourth, responsibilities for education up to matric, primary healthcare, rural health centers, tehsil and district hospitals, drinking water, sanitation and sewerage, agriculture, and community development should reside at the district level and should be administered by the elected local governments. The provincial finance commissions should be revived to divide the revenues between the provincial and district governments. Backward districts and rural areas should be given higher weightage in the allocation of resources.

Fifth, education, health, police, and the judiciary should be taken out of the purview of the national pay scales as they have created rigidities and distortions and reinforced income disparities between the advanced and backward districts. A female science teacher employed at Mithi or Kandhkot should earn a higher salary than the one in Karachi or Hyderabad. Similarly, doctors, nurses, and paramedics serving in remote and inaccessible areas deserve much higher compensation than those living in cities.

Sixth, tax effort by the provinces has slackened after the 7th NFC Award. Incentives have to be built in the 8th NFC Award by giving weightage to the tax effort by the provinces. Urban immovable property tax, agriculture income tax, abiana, and GST on services are some very obvious avenues for additional revenue mobilisation by the provinces. Rough estimates show that, if designed properly and implemented faithfully, the provinces can raise at least two per cent of the GDP.

International experience has shown that if fiscal federalism is not tackled in a responsible manner, it can create serious economic dislocations and disruptions. Argentina and Brazil had suffered from hyperinflation due to the fiscal profligacy of state governments. The institutional and legal arrangements had to be redrawn to overcome this problem and since then checks and balances have worked well. China had to rework the federation-province tax arrangements, which have now provided adequate fiscal space to the federal government. Presently, Spain is facing the consequences of fiscal excesses of strong regional governments. Domestic and international markets are punishing Spain by either withholding credit or raising the price of credit to levels that may make Spain insolvent. We may be at the beginning of the path towards a similar precipice and ought to take preventive measures at this stage and retreat from this dangerous path.

Box 13.2

A New Fiscal Order

Sakib Sherani analyses the implications of the 7th NFC Award.

The seventh NFC Award and the passage of the 18th Amendment have furthered provincial autonomy and the process of devolution to an unprecedented degree.

However, in meeting the spirit of the 1973 constitution, these two seismic developments have added a layer of complexity and challenge to both the governance and fiscal framework of the federation.

On paper, the envisaged quantum increase in the transfer of resources to the provinces under the seventh NFC Award, nearly doubling in size, with stepped-up increases to follow in later years, was to be financed from two sources: the introduction of an integrated (i.e. with goods and services in its ambit) and centrally collected value added tax (VAT) and the transfer of expenditure obligations from the federal budget to the provinces in line with the process of devolution of functions. The latter, however, was to occur after a lapse of one year to allow provinces to prepare, leaving the federal budget under considerable strain during the interim period.

In practice, the transfers under the NFC Award have kicked in without the launch of an integrated VAT (or any successor arrangement such as Reformed General Sales Tax, or even any meaningful fiscal effort by provinces), and devolved functions have been nominally transferred to the provinces without the expenditure obligations. Hence, instead of expenditures totalling Rs. 187bn that were to be transferred to provinces under the devolution exercise (the original calculation worked out at the time of NFC deliberations in 2009), according to the Ministry of Finance, provinces have agreed to take on only Rs. 5bn to Rs. 6bn on to their budgets for 2011–12. This leaves the federal budget to cope with an additional fiscal burden of some 2.7 per cent of GDP at a time when it is trying to bring some sanity to the fiscal framework.

The combination of a lack of overall fiscal effort to meet the increased resource transfers, and the lack of preparation and enhancement of capacity by the provinces to take on the expenditures as well as functions relating to devolved subjects, unless managed properly, is a potential source of a permanent 'structural' fiscal deficit.

Of equally great concern, however, is the potential impact on service delivery. With provinces unwilling to finance key devolved functions such as education and health services, for example, and the federal budget unable to do so with its current constraints, the whole purpose of devolution could be defeated by the potential for near-collapse of service delivery to the common citizen. At its most basic level, for example, the Rabbani commission does not appear to have taken into consideration the need for physical working facilities and provision of housing for the thousands of employees required to staff the devolved functions in the provinces.

Hence, in addition to an existential threat from the lack of fiscal effort, the whole devolution exercise suffered from a fundamental weakness in the formulation stage: the overlooking of the state of provincial capacities to absorb the additional resources in a transparent and well-directed manner, and the absence of a road map on how to build those capacities before functions are transferred.

The critical issue now is how the country's overall fiscal situation post-NFC and the 18th Amendment can be salvaged, and how the overall fiscal framework can be placed on a structurally sounder footing in the post-devolution environment. A number of recommendations to this end:

The 'architecture' of fiscal planning in the country needs to change fundamentally in the light of the 18th Amendment.

Essentially, five different government budgets (one centre plus four provincial) need to be synchronised more than ever before to yield one consolidated, workable overall fiscal framework. This should be done at the level of the Council of Common Interests (CCI), as propounded by Dr Ishrat Husain.

Once the CCI has endorsed the framework, any provincial surplus targets would become binding on the provinces. Failure to do this prior to the formulation of the 2011–12 federal and provincial budgets has resulted in the disconnect between the finance ministry where it programmed a consolidated budget surplus by the provinces equal to 0.7 per cent of GDP while the individual budgets of the provinces yielded a deficit.

In the interim, the federal and provincial governments may need to consider a standstill agreement to be applied to the NFC transfers. This is important since servicing the fiscal transfers to the provinces was contingent on additional resource mobilisation. While the introduction of VAT was explicitly discussed in the NFC deliberations as a prerequisite for the framework to be viable, it was not made a formal, binding part of the NFC agreement. This was a mistake. However, contrary to popular perception, the provinces had lived up to their commitment on the issue till the shenanigans of two top federal bureaucrats unravelled the trust deficit built on the back of the NFC Award, and by default, made the integrated VAT unworkable, at least for Sindh.

Where the provinces have not lived up to their expectations is in the level of their own fiscal effort. With virtually most large tax bases domiciled in the provincial domain (such as agriculture, real estate and services), for tax collection by provinces to total an abysmal 0.5 per cent of GDP is untenable. Without a minimum threshold of provincial fiscal effort, the NFC transfers should be held in abeyance till certain benchmarks are achieved. The 'trigger' for NFC transfers to resume could be, for example, achievement of tax collection equal to one per cent of GDP by the provinces.

Finally, since the provinces will be able to borrow commercially after the passage of the 18th Amendment, it may become necessary to have provincial legislatures pass their own Fiscal Responsibility and Debt Limitation laws to establish the overall debt ceiling.

13.3.2 Poverty or Backwardness Criteria

Like many other developing countries, Pakistan has been suffering from poverty, unemployment, and inflation. Being a poor country the NFC 2010 Award laid down 10.3 per cent of the total divisible pool to be distributed on the criterion of poverty and backwardness. For targeting poverty, the federal and provincial governments need to have fair and reliable statistics on the poverty profile. The percentage of total population living below the line of poverty (see Table 13.15) after independence has declined considerably, by almost 10 per cent in 1969 and then by a greater magnitude of 23 per cent up to 1998. The situation started worsening with poverty rising from 17 per cent to 36 per cent in eleven years. This kind of volatility is a major concern when preparing development policies.

Not only does the incidence of poverty vary across the federating units of Pakistan, but within the provinces variance in urban and rural poverty and incidence in large and small cities is substantially high. As Table 13.16 shows, the overall position of Pakistan, Punjab, and Sindh is almost the same, i.e. 36.79 per cent, 35 per cent, and 36.27 per cent, respectively. Furthermore, the two less, developed provinces KPK and Balochistan are at 41.71 per cent and 45.68 per cent. Lifestyle, standards of living, baskets of consumptions and every other parameter is distinguished between the urban and rural areas. Therefore, it is imperative to study the nature, resulting problems, and countering strategies for urban and rural poverty, separately. As a whole, Punjab, KPK, and Balochistan reflect 0.44 per cent, 8.67 per cent, and 3.05 per cent (see Table 13.16) lower incidence of poverty in rural areas compared to urban areas. However, variance amongst the large and small cities is simply not comparable.

Equalizing federal transfers to the provincial or sub-national governments is primarily of a redistributive nature and is meant to provide public goods to achieve the objectives of reducing poverty, inter- and intra-regional disparities, and providing social sector development generally. Sometimes, targeted conditional matching grants are also provided for such objectives. Estimating the level of poverty and designing the framework of fiscal transfers accordingly, is the need of the time. As Graph 13.2 shows, the average poverty in all of the provinces is almost at the same level, which is clearly not the case as much research shows. The NFC Award should have taken into account the conceptual segregation between rural and urban poverty and then, per capita equalization matching grants for poverty reduction should have been sanctioned accordingly.

13.3.3 Revenue Collection and Generation Criteria

Modern states are presumed to have an inbuilt responsibility for the welfare of their citizens. Redistribution of income and wealth have always been for important moral and economic justice. It is a common problem in most of the developing nations that revenues are lower than expenditures, accounting for fiscal deficits, as is the case of Pakistan.

Provision of public goods by provinces is mainly dependent on federal transfers in Pakistan. It is argued that a good transfer system ought to take account of the fiscal capacity to generate own-source revenue and reward fiscal effort proportionately. The present arrangement arrived at accounts for revenue generation and revenue collection of up to 5 per cent, which is a weak incentive for those provinces which have substantial economic activity and revenue generation and collection. Out of the 5 per cent share in revenue collection and generation, 2.5 per cent is for Sindh, Punjab's share is 2.2 per cent, while KPK and Balochistan are 0.25 per

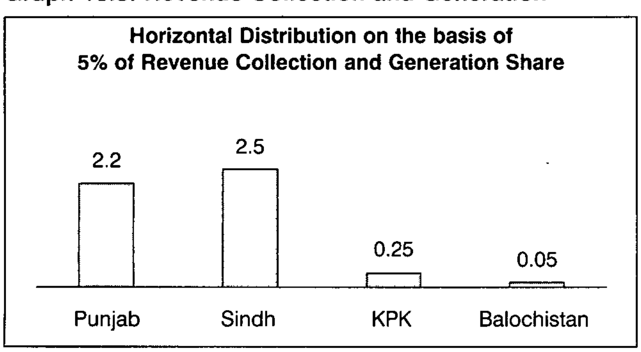
cent and 0.05 per cent, respectively—see Graph 13.3. We will now discuss the revenue collection statistics of the federating units of Pakistan, and the major contribution sources of revenue to the system.

Graph 13.3: Revenue Collection and Generation



Source: Based on NFC 2010 Award Distribution.

13.3.4 Tax Collection and Distribution across Federating Units of Pakistan

On average, the two developed provinces of Pakistan, Sindh and Punjab, make a significant contribution amounting to 96.35 per cent of the tax collection and generation, while the contribution of the two less-developed provinces, KPK and Balochistan, is 3.65 per cent on average for 2001–12. Table 13.17 shows the dominance of Sindh over the other provinces, but this is strictly not comparable due to its monopoly over port resources which facilitates superiority in collection of indirect taxes such as custom sales tax, and FED on imports. The average 2001–12 share of Sindh was 65.44 per cent, followed by Punjab at 29.84 per cent, KPKs at 3.38 per cent, and Balochistan at 1.34 per cent, with a maximum of 71.78 per cent, 34.91 per cent, 5.42 per cent, and 2.07 per cent for each of the provinces during 2001–12. In the NFC Award 2006, Sindh's argument was based on its capacity of revenue collection and generation which had no competitor. However, due to an absence of consensus, no Award was announced, and instead the President issued a revenue order.

Karachi ranks on top on the basis of average overall tax collection in the past twelve years, with an average of 62.7 per cent, followed by Lahore at 13.63 per cent, Rawalpindi at 8.33 per cent, Multan at 5.50 per cent, and Peshawar at 3.19 per cent; the rest of the ten cities (Hyderabad, Quetta, Faisalabad, Gujranwala, Abbottabad, Sialkot, Sukkur, Sargodha, and Bahawalpur) individually lie below 3 per cent and jointly account for 7.28 per cent of the overall tax collection. The situation is quite obvious and often exploited for political mileage for Karachi to be awarded provincial status or greater fiscal autonomy—see Chapter 23. As a whole, the average collection of taxes in Sindh over the last twelve years, 2001–12, shows 95.83 per cent collection from Karachi and 2.09 per cent and 2.08 per cent from Hyderabad and Sukkur.

More recently in 2011–12 the joint share of the top five cities (Karachi, Lahore, Rawalpindi, Multan, and Peshawar) accumulated to 92.08 per cent and the next ten cities' share just 7.92 per cent. We will now discuss the components of tax collection in detail. The overall taxes are broadly classified into two categories, direct and indirect taxes. Direct taxes include Income and Corporation Tax, Withholding Tax, Workers' Welfare Fund (WWF), Workers' Profit Participation Fund (WPPF), Capital Value Tax (CVT), and Corporate Asset Tax (CAT). The 18th Amendment to the Constitution has devolved CVT on immovable properties to the provinces. Indirect taxes include custom duties, sales tax on domestic and imports, and FED on domestic and imports. Pakistan's taxation structure is highly dependent on indirect taxes.

The average position of provinces in direct tax collection is almost the same, with Sindh being the highest with 64.97 per cent, Punjab with 30.93 per cent, KPK with 3.24 per cent, and Balochistan with 0.86 per cent. Karachi dominates with an average 61.49 per cent, followed by Lahore, Rawalpindi, Multan and Peshawar with 17.33 per cent, 4.30 per cent,

3.65 per cent, and 3.03 per cent, respectively. Indirect tax collection statistics are almost the same as for direct taxes, with Karachi dominating with an average 62.79 per cent, followed by Lahore, Rawalpindi, Multan, and Peshawar. Sindh's absolute advantage due to its monopoly over port resources can be observed in custom duty collection from a minimum of 78.92 per cent in 2007/08 to a maximum of 94.73 per cent in 2001/02. On average, 2001–12 Sindh's share in collection of custom was 84.21 per cent, followed by Punjab with 12.43 per cent, KPK with 2.31 per cent, and Balochistan with 1.05 per cent

For sales tax collection on domestically produced goods, Punjab has been contributing more than half of the sales with a percentage share of 55.5 per cent followed by Sindh with 40.20 per cent, and KPK and Balochistan with 2.91 per cent and 1.57 per cent. Karachi's average 2001–12 share was 35.63 per cent followed by Rawalpindi 's 23.49 per cent, Lahore's 19.58 per cent and Multan's 10.19 per cent, where these four cities account for 88.89 per cent collection with the remaining larger cities contributing individually below 5 per cent and jointly 11.11 per cent.

These patterns are reflected in other taxes as well. Although Sindh enjoys the largest share of the pie on account of revenue generation and collection, which is evident from the case presented above, the argument is that rewarding fiscal effort to an extent of five per cent and poverty and backwardness to almost more than double, i.e. 10.3 per cent, seems unfair and unjust and is a big incentive for not broadening the tax base and raising own-source revenue by sub-national governments in Pakistan. Therefore, rewarding fiscal effort should be linked to the per capita fiscal capacity of the province, rather than taking into account revenue collection and generation only. Consider the example of India—see Table 13.18—where the tax effort has been rewarded to 10 per cent in the 10th Finance Commission (1995–00) and 7.5 per cent in the 11th (2000–05) and 12th (2005–10). More recently, in the 13th (2010–15) Finance Commission Award, the tax effort has been abolished and the weight for fiscal discipline increased from 7.5 per cent to 17.5 per cent, which we advocate in the NFC criteria for Pakistan.

Provincial budgets are dependent on federal government transfers, and the way out is to increase the investment share in sub-national and national income apart from raising the tax-GDP ratio.

13.3.5 Inverse Population Density Criteria

One of the important features of development planning is to take care of the area in which government desires to intervene. In a technical sense, the dynamics of an area, its population, population density, i.e. persons living per square kilometres area and the needs of the people, and how much it costs for the government to create per capita provision of public goods, all matter. In a place where the population density is high, the provision of public goods per capita will be more practical and useful for a larger number of people. However, a province like Balochistan where the distance from one city to the next and one village to the other is very high, providing public goods and services and maintaining

them would cost very much and in turn may not deliver the same results as in dense areas. This does not mean that high population density areas have no problems for public service delivery, and in Karachi or Lahore establishing an efficient traffic network system is an extremely difficult task.

As Table 13.19 shows, the population density of Balochistan is the lowest amongst all the provinces with 27 persons per square kilometre, compared to Punjab (488), Sindh (313), and KPK (333). There is no comparison of Balochistan with the rest of the provinces; therefore, to compensate Balochistan the inclusion of an inverse population density criterion has been made part of the NFC 2010 Award—see Graph 13.4.

13.4 Some Issues Relating to Intergovernmental Fiscal Transfers and the NFC 2010 Award

13.4.1 Vertical Fiscal Imbalances

A fiscal imbalance is the mismatch between the revenue and expenditures of a government. The literature on fiscal federalism discusses two types of fiscal imbalances. Vertical fiscal imbalance is measured between two different levels (tiers) of government, i.e. national and sub-national, while horizontal fiscal imbalance is measured between the governments at the same level (tier).

Table 13.9 shows that vertical fiscal imbalance exhibits an almost consistent pattern over the period with the exception of the first Award after the fall of East Pakistan. The alarming situation is that the provincial share in revenues declined from a maximum of 14.2 per cent in 1972–75 to a minimum of 5.7 per cent which substantiates the argument of the substitution of federal transfers over own-source revenue efforts by sub-national governments in Pakistan. On the other side of the picture, the expenditure share of provincial government touched a maximum of 54.4 per cent and decreased over the period to a minimum of 25 per cent, although the situation is not very encouraging. The way out of this dilemma is to raise the provincial tax base and tax revenues.

13.4.2 Multiple Criteria and the Way Forward
